Meclofenamate Sodium: A white to creamy white, odorless to almost odorless, crystalline powder. Freely soluble in water, the solution sometimes being somewhat turbid

due to partial hydrolysis and absorption of carbon dioxide; soluble in methanol; slightly soluble in chloroform; practically insoluble in ether. The solution is clear above pH 11.5.

Medroxyprogesterone Acetate: White to off-white, odorless, crystalline powder. Melts at about 205°. Is stable in air. Freely soluble in chloroform; soluble in acetone and in dioxane; sparingly soluble in alcohol and in methanol; slightly soluble in ether; insoluble in water.

Mefenamic Acid: White to off-white, crystalline powder. Melts at about 230°, with decomposition. Soluble in solutions of alkali hydroxides; sparingly soluble in chloroform; slightly soluble in alcohol and in methanol; practically insoluble in water.

Mefloquine Hydrochloride: White or slightly yellow, crystalline powder. It exhibits polymorphism. Freely soluble in methanol; soluble in alcohol; very slightly soluble in water.

Megestrol Acetate: White to creamy white, tasteless and essentially odorless, crystalline powder. Very soluble in chloroform; soluble in acetone; sparingly soluble in alcohol; slightly soluble in ether and in fixed oils; insoluble in water. Is unstable under aqueous conditions at pH 7 or above.

Meglumine: White to faintly yellowish-white, odorless crystals or powder. Freely soluble in water; sparingly soluble in alcohol.

Melengestrol Acetate: White to light yellow, crystalline powder. Freely soluble in chloroform and in ethyl acetate; slightly soluble in alcohol; insoluble in water.

Meloxicam: Pale yellow powder. Soluble in dimethylformamide; slightly soluble in acetone; very slightly soluble in methanol and in alcohol; practically insoluble in water.

Melphalan: Off-white to buff powder, having a faint odor. Melts at about 180°, with decomposition. Soluble in dilute mineral acids; slightly soluble in alcohol and in methanol; practically insoluble in water, in chloroform, and in ether.

Menadiol Sodium Diphosphate: White to pink powder, having a characteristic odor. Is hygroscopic. Its solutions are neutral or slightly alkaline to litmus, having a pH of about 8. Very soluble in water; insoluble in alcohol.

Menadione: Bright yellow, crystalline, practically odorless powder. Is affected by sunlight. Soluble in vegetable oils; sparingly soluble in chloroform and in alcohol; practically insoluble in water.

Menthol: Colorless, hexagonal crystals, usually needle-like, or in fused masses, or crystalline powder. Has a pleasant, peppermint-like odor. Very soluble in alcohol, in chloroform, in ether, and in solvent hexane; freely soluble in glacial acetic acid, in mineral oil, and in fixed and volatile oils; slightly soluble in water. *NF category:* Flavors and perfumes.

Meperidine Hydrochloride: Fine, white, crystalline, odorless powder. The pH of a solution (1 in 20) is about 5. Very soluble in water; soluble in alcohol; sparingly soluble in ether.

Mephobarbital: White, odorless, crystalline powder, having a bitter taste. Its saturated solution is acid to litmus. Soluble in chloroform and in solutions of fixed alkali hydroxides and carbonates; slightly soluble in water, in alcohol, and in ether.

Mepivacaine Hydrochloride: White, odorless, crystalline solid. The pH of a solution (1 in 50) is about 4.5. Freely soluble in water and in methanol; very slightly soluble in chloroform; practically insoluble in ether.

Meprobamate: White powder, having a characteristic odor and a bitter taste. Freely soluble in acetone and in alcohol; slightly soluble in water; practically insoluble or insoluble in ether.

Mercaptopurine: Yellow, odorless or practically odorless, crystalline powder. Melts at a temperature exceeding 308°, with decomposition. Soluble in hot alcohol and in

dilute alkali solutions; slightly soluble in 2 N sulfuric acid; insoluble in water, in acetone, and in ether.

Ammoniated Mercury: White, pulverulent pieces or white, amorphous powder. Is odorless, and is stable in air, but darkens on exposure to light. Readily soluble in warm hydrochloric, nitric, and acetic acids; insoluble in water, and in alcohol.

Meropenem: Colorless to white crystals. Soluble in dimethylformamide and in 5% dibasic potassium phosphate solution; sparingly soluble in water and in 5% monobasic potassium phosphate solution; very slightly soluble in alcohol; practically insoluble in acetone and in ether.

Mesalamine: Light tan to pink colored, needle-shaped crystals. Color may darken on exposure to air. Is odorless or may have a slight characteristic odor. Soluble in dilute hydrochloric acid and in dilute alkali hydroxides; slightly soluble in water; very slightly soluble in methanol, in dehydrated alcohol, and in acetone; practically insoluble in *n*-butyl alcohol, in chloroform, in ether, in ethyl acetate, in *n*-hexane, in methylene chloride, and in *n*-propyl alcohol.

Mesna: White or slightly yellow crystalline powder; hygroscopic. Freely soluble in water; slightly soluble in alcohol; practically insoluble in cyclohexane.

Mesoridazine Besylate: White to pale yellowish powder, having not more than a faint odor. Melts at about 178°, with decomposition. Freely soluble in water, in chloroform, and in methanol.

Mestranol: White to creamy white, odorless, crystalline powder. Freely soluble in chloroform; soluble in dioxane; sparingly soluble in dehydrated alcohol; slightly soluble in methanol; insoluble in water.

Metaproterenol Sulfate: White to off-white, crystalline powder. Freely soluble in water.

Metformin Hydrochloride: White, crystalline powder. Freely soluble in water; slightly soluble in alcohol; practically insoluble in acetone and in methylene chloride.

Methacholine Chloride: Colorless or white crystals, or white, crystalline powder. Is odorless or has a slight odor, and is very hygroscopic. Its solutions are neutral to litmus. Very soluble in water; freely soluble in alcohol and in chloroform.

Methacrylic Acid Copolymer: White powder having a faint, characteristic odor. The polymer is soluble in diluted alkali, in simulated intestinal fluid TS, and in buffer solutions of pH 7 and above. The solubility between pH 5.5 and pH 7 depends on the content of methacrylic acid units in the copolymer. The polymer is freely soluble to soluble in methanol, in alcohol, in isopropyl alcohol, and in acetone, each of which contains not less than 3% of water; insoluble in water, in diluted acids, in simulated gastric fluid TS, and in buffer solutions of up to pH 5. *NF category:* Coating agent.

Methacrylic Acid Copolymer Dispersion: Milky-white liquid of low viscosity. It is miscible with water in any proportion; the milky-white appearance is retained. A clear or slightly opalescent, viscous solution is obtained on mixing one part with five parts of acetone, alcohol, or isopropyl alcohol; the polymer substance is first precipitated, but then dissolves in the excess organic solvent. A clear or slightly opalescent, viscous solution is obtained on mixing one part with two parts of 1 N sodium hydroxide.

Methacrylic Acid and Ethyl Acrylate Copolymer: White powder having a faint, characteristic odor. Soluble to freely soluble in methanol, in alcohol, in isopropyl alcohol, and in acetone, each of which contains not less than 3% of water; soluble in diluted alkali, in simulated intestinal fluid TS, and in buffer solutions of pH 7 and above; insoluble in water, in diluted acids, in simulated gastric fluid TS, and in buffer solutions of up to pH 5. The solubility between pH 5.5 and pH 7 depends on the content of methacrylic acid units in the copolymer. *NF category:* Coating agent; film-forming agent.

Partially-Neutralized Methacrylic Acid and Ethyl Acrylate Copolymer: White or almost white, free-flowing powder. Freely soluble in alcohol, in methanol, and in a 40 g/L solution of sodium hydroxide; soluble in solutions at pH values above pH 5.5 under salt formation; practically insoluble in ethyl acetate and in acidic aqueous solutions. *NF category:* Coating agent; film-forming agent.

Methacrylic Acid and Methyl Methacrylate Copolymer: White powder having a faint, characteristic odor. Soluble to freely soluble in methanol, in alcohol, in isopropyl alcohol, and in acetone, each of which contains not less than 3% of water; soluble in diluted alkali, in simulated intestinal fluid TS, and in buffer solutions of pH 7 and above; insoluble in water, in diluted acids, in simulated gastric fluid TS, and in buffer solutions of up to pH 5. The solubility between pH 5.5 and pH 7 depends on the content of methacrylic acid units in the copolymer. *NF category:* Coating agent; film-forming agent.

Methacycline Hydrochloride: Yellow to dark yellow, crystalline powder. Soluble in water.

Methadone Hydrochloride: Colorless crystals or white, crystalline, odorless powder. Freely soluble in alcohol and in chloroform; soluble in water; practically insoluble in ether and in glycerin.

Methadone Hydrochloride Oral Concentrate: Clear to slightly hazy, syrupy liquid.

Methamphetamine Hydrochloride: White crystals or white, crystalline powder. Is odorless or practically so. Its solutions have a pH of about 6. Freely soluble in water, in alcohol, and in chloroform; very slightly soluble in absolute ether.

Methazolamide: White or faintly yellow, crystalline powder having a slight odor. Melts at about 213°. Soluble in dimethylformamide; slightly soluble in acetone; very slightly soluble in water and in alcohol.

Methdilazine Hydrochloride: Light tan, crystalline powder, having a slight, characteristic odor. Freely soluble in water, in alcohol, and in chloroform.

Methenamine: Colorless, lustrous crystals or white, crystalline powder. Is practically odorless. When brought into contact with fire, it readily ignites, burning with a smokeless flame. It sublimes at about 260°, without melting. Its solutions are alkaline to litmus. Freely soluble in water; soluble in alcohol and in chloroform.

Methenamine Mandelate: White, crystalline powder. Has a sour taste and is practically odorless. Its solutions have a pH of about 4. Melts at about 127°, with decomposition. Very soluble in water; soluble in alcohol and in chloroform; slightly soluble in ether.

Methimazole: White to pale buff, crystalline powder, having a faint, characteristic odor. Its solutions are practically neutral to litmus. Freely soluble in water, in alcohol, and in chloroform; slightly soluble in ether.

Methionine: White crystals, having a characteristic odor and taste. Soluble in water, in warm dilute alcohol, and in dilute mineral acids; insoluble in ether, in absolute alcohol, in benzene, and in acetone (L-form).

Methocarbamol: White powder, odorless, or having a slight characteristic odor. Melts at about 94°, or, if previously ground to a fine powder, melts at about 90°. Soluble in alcohol only with heating; sparingly soluble in water and in chloroform; insoluble in benzene and in *n*-hexane.

Methohexital: White to faintly yellowish-white, crystalline, odorless powder. Slightly soluble in alcohol, in chloroform, and in dilute alkalies; very slightly soluble in water.

Methohexital Sodium for Injection: White to off-white, hygroscopic powder. Is essentially odorless.

Methotrexate: Orange-brown, or yellow, crystalline powder. Freely soluble in dilute solutions of alkali hydroxides and carbonates; slightly soluble in 6 N hydrochloric acid;

practically insoluble in water, in alcohol, in chloroform, and in ether.

Methotrimeprazine: Fine, white, practically odorless, crystalline powder. Melts at about 126°. Freely soluble in chloroform, in ether, and in boiling alcohol; sparingly soluble in methanol and in alcohol at 25°; practically insoluble in water.

Methoxsalen: White to cream-colored, fluffy, needle-like crystals. Is odorless. Freely soluble in chloroform; soluble in boiling alcohol, in acetone, in acetic acid, in propylene glycol, and in benzene; sparingly soluble in boiling water and in ether; practically insoluble in water.

Methoxsalen Topical Solution: Clear, colorless liquid.

Methoxyflurane: Clear, practically colorless, mobile liquid, having a characteristic odor. Boils at about 105°. Miscible with alcohol, with acetone, with chloroform, with ether, and with fixed oils.

Methsuximide: White to grayish white, crystalline powder. Is odorless, or has not more than a slight odor. Very soluble in chloroform; freely soluble in alcohol and in ether; slightly soluble in hot water.

Methylclothiazide: White or practically white, crystalline powder. Is odorless, or has a slight odor. Freely soluble in acetone and in pyridine; sparingly soluble in methanol; slightly soluble in alcohol; very slightly soluble in water, in chloroform, and in benzene.

Methyl Alcohol: Clear, colorless liquid, having a characteristic odor. Is flammable. Miscible with water, with alcohol, with ether, with benzene, and with most other organic solvents. *NF category:* Solvent.

Methyl Benzylidene Camphor: A white, fine crystalline powder. Very soluble in chloroform; freely soluble in alcohol; practically insoluble in water.

Methyl Isobutyl Ketone: Transparent, colorless, mobile, volatile liquid, having a faint ketonic and camphoraceous odor. Slightly soluble in water. Miscible with alcohol, with ether, and with benzene. *NF category:* Alcohol denaturant; solvent.

Methyl Salicylate: Colorless, yellowish, or reddish liquid, having the characteristic odor and taste of wintergreen. It boils between 219° and 224°, with some decomposition. Soluble in alcohol and in glacial acetic acid; slightly soluble in water. *NF category:* Flavors and perfumes.

Methylbenzethonium Chloride: White, hygroscopic crystals, having a mild odor. Its solutions are neutral or slightly alkaline to litmus. Very soluble in water, in alcohol, and in ether; practically insoluble in chloroform.

Methylcellulose: White, fibrous powder or granules. Its aqueous suspensions are neutral to litmus. It swells in water and produces a clear to opalescent, viscous, colloidal suspension. Soluble in glacial acetic acid and in a mixture of equal volumes of alcohol and chloroform; insoluble in alcohol, in ether, and in chloroform. *NF category:* Coating agent; suspending and/or viscosity-increasing agent; tablet binder.

Methyldopa: White to yellowish-white, odorless, fine powder, which may contain friable lumps. Very soluble in 3 N hydrochloric acid; sparingly soluble in water; slightly soluble in alcohol; practically insoluble in ether.

Methyldopate Hydrochloride: White or practically white, odorless or practically odorless, crystalline powder. Freely soluble in water, in alcohol, and in methanol; slightly soluble in chloroform; practically insoluble in ether.

Methylene Blue: Dark green crystals or crystalline powder having a bronze-like luster. Is odorless or practically so, and is stable in air. Its solutions in water and in alcohol are deep blue in color. Soluble in water and in chloroform; sparingly soluble in alcohol.

Methylene Chloride: Clear, colorless, mobile liquid, having an odor resembling that of chloroform. Miscible with

alcohol, with ether, and with fixed and volatile oils. *NF category:* Solvent.

Methylergonovine Maleate: White to pinkish-tan, microcrystalline powder. Is odorless. Slightly soluble in water and in alcohol; very slightly soluble in chloroform and in ether.

Methylparaben: White, crystalline powder or colorless crystals. Freely soluble in alcohol and in methanol; slightly soluble in water. *NF category:* Antimicrobial preservative.

Methylparaben Sodium: White, hygroscopic powder. Freely soluble in water; sparingly soluble in alcohol; insoluble in fixed oils. *NF category:* Antimicrobial preservative.

Methylphenidate Hydrochloride: White, odorless, fine, crystalline powder. Its solutions are acid to litmus. Freely soluble in water and in methanol; soluble in alcohol; slightly soluble in chloroform and in acetone.

Methylprednisolone: White to practically white, odorless, crystalline powder. Melts at about 240°, with some decomposition (see *Melting Range or Temperature* <741>). Sparingly soluble in alcohol, in dioxane, and in methanol; slightly soluble in acetone and in chloroform; very slightly soluble in ether; practically insoluble in water.

Methylprednisolone Acetate: White or practically white, odorless, crystalline powder. Melts at about 225°, with some decomposition (see *Melting Range or Temperature* <741>). Soluble in dioxane; sparingly soluble in acetone, in alcohol, in chloroform, and in methanol; slightly soluble in ether; practically insoluble in water.

Methylprednisolone Hemisuccinate: White or nearly white, odorless or nearly odorless, hygroscopic solid. Freely soluble in alcohol; soluble in acetone; very slightly soluble in water.

Methylprednisolone Sodium Succinate: White or nearly white, odorless, hygroscopic, amorphous solid. Very soluble in water and in alcohol; very slightly soluble in acetone; insoluble in chloroform.

Methylpyrrolidone: A clear, colorless liquid. Miscible with water and with most organic solvents including alcohol, ketones, and aromatic and chlorinated hydrocarbons. Boiling point: about 202°. Refractive index: about 1.469. *NF category:* Solvent.

Methylsulfonylmethane: White powder or flake crystal. Melts at about 109°. Freely soluble in water, in methanol, in alcohol, and in acetone; sparingly soluble in ether.

Methyltestosterone: White or creamy white crystals or crystalline powder. Is odorless and is stable in air, but is slightly hygroscopic. Is affected by light. Soluble in alcohol, in methanol, in ether, and in other organic solvents; sparingly soluble in vegetable oils; practically insoluble in water.

Methysergide Maleate: White to yellowish-white or reddish-white, crystalline powder. Is odorless or has not more than a slight odor. Slightly soluble in water and in alcohol; very slightly soluble in chloroform; practically insoluble in ether.

Metoclopramide Hydrochloride: White or practically white, crystalline, odorless or practically odorless powder. Very soluble in water; freely soluble in alcohol; sparingly soluble in chloroform; practically insoluble in ether.

Metoprolol Succinate: White to off-white powder. Freely soluble in water; soluble in methanol; sparingly soluble in alcohol; slightly soluble in isopropyl alcohol.

Metoprolol Tartrate: White, crystalline powder. Very soluble in water; freely soluble in methylene chloride, in chloroform, and in alcohol; slightly soluble in acetone; insoluble in ether.

Metronidazole: White to pale yellow, odorless crystals or crystalline powder. Is stable in air, but darkens on exposure to light. Soluble in dilute hydrochloric acid (1 in 2); sparingly soluble in water and in alcohol; slightly soluble in ether and in chloroform.

Metronidazole Benzoate: White to slightly yellow, crystalline powder. Freely soluble in methylene chloride; soluble in acetone; slightly soluble in alcohol; very slightly soluble in ethyl ether; practically insoluble in water.

Metyrapone: White to light amber, fine, crystalline powder, having a characteristic odor. Darkens on exposure to light. Soluble in methanol and in chloroform; sparingly soluble in water. It forms water-soluble salts with acids.

Mexiletine Hydrochloride: White powder. Freely soluble in dehydrated alcohol and in water; slightly soluble in acetonitrile; practically insoluble in ether. Optically inactive (1 in 20 solution in water).

Mezlocillin Sodium: White to pale yellow, crystalline powder. Freely soluble in water.

Mibolerone: White to off-white powder. Slightly soluble in chloroform, in dioxane, and in methylene chloride; practically insoluble in water (0.0454 mg per mL at 37°).

Miconazole: White to pale cream powder. Melts in the range of 78° to 88°. May exhibit polymorphism. Freely soluble in alcohol, in methanol, in isopropyl alcohol, in acetone, in propylene glycol, in chloroform, and in dimethylformamide; soluble in ether; insoluble in water.

Miconazole Nitrate: White or practically white, crystalline powder, having not more than a slight odor. Melts in the range of 178° to 183°, with decomposition. Freely soluble in dimethyl sulfoxide; soluble in dimethylformamide; sparingly soluble in methanol; slightly soluble in alcohol, in chloroform, and in propylene glycol; very slightly soluble in water and in isopropyl alcohol; insoluble in ether.

Midazolam: White or yellowish powder. The hydrochloride salt of midazolam is soluble in aqueous solutions. Insoluble in water.

Midodrine Hydrochloride: White crystalline powder. Soluble in water; sparingly soluble in methanol.

Milrinone: White to tan, crystalline solid. Is hygroscopic. Freely soluble in dimethyl sulfoxide; very slightly soluble in methanol; practically insoluble in water and in chloroform.

Mineral Oil: Colorless, transparent, oily liquid, free or practically free from fluorescence. Is odorless and tasteless when cold, and develops not more than a faint odor of petroleum when heated. Soluble in volatile oils; insoluble in water and in alcohol. Miscible with most fixed oils but not with castor oil. *NF category:* Solvent; vehicle (oleaginous).

Light Mineral Oil: Colorless, transparent, oily liquid, free, or practically free, from fluorescence. Is odorless and tasteless when cold, and develops not more than a faint odor of petroleum when heated. Soluble in volatile oils; insoluble in water and in alcohol. Miscible with most fixed oils, but not with castor oil. *NF category:* Tablet and/or capsule lubricant; vehicle (oleaginous).

Minocycline Hydrochloride: Yellow, crystalline powder. Soluble in solutions of alkali hydroxides and carbonates; sparingly soluble in water; slightly soluble in alcohol; practically insoluble in chloroform and in ether.

Minoxidil: White to off-white, crystalline powder. Melts in the approximate range of between 248° and 268°, with decomposition. Soluble in alcohol and in propylene glycol; sparingly soluble in methanol; slightly soluble in water; practically insoluble in chloroform, in acetone, in ethyl acetate, and in hexane.

Mirtazapine: White to creamy white, crystalline powder. Freely soluble in methanol and in toluene; soluble in ethyl ether; sparingly soluble in *n*-hexane; practically insoluble in water.

Misoprostol: Clear, colorless or light yellow viscous liquid. Very slightly soluble in water.

Mitomycin: Blue-violet, crystalline powder. Soluble in acetone, in methanol, in butyl acetate, and in cyclohexanone; slightly soluble in water.

Mitotane: White, crystalline powder, having a slight, aromatic odor. Soluble in alcohol, in ether, in solvent hexane, and in fixed oils and fats; practically insoluble in water.

Mitoxantrone Hydrochloride: Dark blue powder. Sparingly soluble in water; slightly soluble in methanol; practically insoluble in acetone, in acetonitrile, and in chloroform.

Modafinil: White to off-white, crystalline powder. Sparingly soluble in methanol; slightly soluble in absolute alcohol; very slightly soluble in water.

Mometasone Furoate: White to off-white powder. Melts at about 220°, with decomposition. Soluble in acetone and in methylene chloride.

Monensin Sodium: Off-white to tan, crystalline powder. Soluble in chloroform and in methanol; slightly soluble in water; practically insoluble in solvent hexane.

Mono- and Di-glycerides: Vary in consistency from yellow liquids, through ivory-colored plastics, to ivory white-colored solids (bead or flake forms). Soluble in alcohol, in ethyl acetate, in chloroform, and in other chlorinated hydrocarbons; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent.

Monobenzene Ointment: Dispersible with, but not soluble in, water.

Monoethanolamine: Clear, colorless, moderately viscous liquid, having a distinctly ammoniacal odor. Miscible with water, with acetone, with alcohol, with glycerin, and with chloroform. Immiscible with ether, with solvent hexane, and with fixed oils, although it dissolves many essential oils. *NF category:* Emulsifying and/or solubilizing agent.

Monoglyceride Citrate: Soft white to ivory-colored, waxy solid with a lard-like consistency and bland odor. Dispersible in most common fat solvents and in alcohol. Insoluble in water.

Monosodium Glutamate: White, practically odorless, free-flowing crystals or crystalline powder. Freely soluble in water; sparingly soluble in alcohol. May have either a slightly sweet or a slightly salty taste. *NF category:* Flavors and perfumes.

Monothioglycerol: Colorless or pale yellow, viscous liquid, having a slight sulfidic odor. Is hygroscopic. Freely soluble in water; insoluble in ether. Miscible with alcohol. *NF category:* Antioxidant.

Montelukast Sodium: White or almost white, hygroscopic powder. Freely soluble to very soluble in alcohol; freely soluble in water and in methylene chloride.

Morantel Tartrate: A white or pale yellow, crystalline powder. Very soluble in water and in alcohol; practically insoluble in ethyl acetate.

Moricizine Hydrochloride: White to off-white, crystalline powder. Melts at about 189°, with decomposition. Soluble in water and in alcohol.

Morphine Sulfate: White, feathery, silky crystals, cubical masses of crystals, or white, crystalline powder. Is odorless, and when exposed to air it gradually loses water of hydration. Darkens on prolonged exposure to light. Freely soluble in hot water; soluble in water; slightly soluble in alcohol but more so in hot alcohol; insoluble in chloroform and in ether.

Moxifloxacin Hydrochloride: Slightly yellow to yellow powder or crystals. Soluble in 0.1 N sodium hydroxide; sparingly soluble in water and in methanol; slightly soluble in 0.1 N hydrochloric acid, in dimethylformamide, and in alcohol; practically insoluble in methylene chloride, in acetone, in ethyl acetate, and in toluene; insoluble in *tert*-butyl methyl ether and *n*-heptane.

Mumps Skin Test Antigen: Slightly turbid liquid.

Mumps Virus Vaccine Live: Solid having the characteristic appearance of substances dried from the frozen state. The Vaccine is to be constituted with a suitable diluent just prior to use. Constituted vaccine undergoes loss of potency on exposure to sunlight.

Mupirocin: White to off-white, crystalline solid. Freely soluble in acetone, in chloroform, in dehydrated alcohol, and in methanol; slightly soluble in ether; very slightly soluble in water.

Mycophenolate Mofetil: White or almost white, crystalline powder. Its melting range is between 94° and 98°. Freely soluble in acetone; soluble in methanol; sparingly soluble in dehydrated alcohol; slightly soluble in water.

Myristic Acid: Hard, white or faintly yellow, somewhat glossy, crystalline solid or white or yellow-white powder. Soluble in alcohol, in chloroform, and in ether; practically insoluble in water. *NF category:* Antifoaming agent.

Nabumetone: A white, or almost white, crystalline powder. Freely soluble in acetone; sparingly soluble in alcohol and in methanol; practically insoluble in water.

Nadolol: White to off-white, practically odorless, crystalline powder. Freely soluble in alcohol and in methanol; soluble in water at pH 2; slightly soluble in chloroform, in methylene chloride, in isopropyl alcohol, and in water (between pH 7 and pH 10); insoluble in acetone, in benzene, in ether, in hexane, and in trichloroethane.

Nafcillin Sodium: White to yellowish-white powder, having not more than a slight characteristic odor. Freely soluble in water and in chloroform; soluble in alcohol.

Nalidixic Acid: White to very pale yellow, odorless, crystalline powder. Soluble in chloroform, in methylene chloride, and in solutions of fixed alkali hydroxides and carbonates; slightly soluble in acetone, in alcohol, in methanol, and in toluene; very slightly soluble in ether and in water.

Naloxone Hydrochloride: White to slightly off-white powder. Its aqueous solution is acidic. Soluble in water, in dilute acids, and in strong alkali; slightly soluble in alcohol; practically insoluble in ether and in chloroform.

Naloxone Hydrochloride Injection: Clear, colorless liquid.

Nandrolone Decanoate: Fine, white to creamy white, crystalline powder. Is odorless, or may have a slight odor. Soluble in chloroform, in alcohol, in acetone, and in vegetable oils; practically insoluble in water.

Naphazoline Hydrochloride: White, crystalline powder. Is odorless and has a bitter taste. Melts at a temperature of about 255°, with decomposition. Freely soluble in water and in alcohol; very slightly soluble in chloroform; practically insoluble in ether.

Naproxen: White to off-white, practically odorless, crystalline powder. Soluble in chloroform, in dehydrated alcohol, and in alcohol; sparingly soluble in ether; practically insoluble in water.

Naproxen Sodium: White to creamy crystalline powder. Soluble in water and in methanol; sparingly soluble in alcohol; very slightly soluble in acetone; and practically insoluble in chloroform and in toluene. Melts at about 255°, with decomposition.

Narasin: White to off-white, crystalline powder. Melts at about 217°, with decomposition. Soluble in methanol and in water.

Naratriptan Hydrochloride: White to pale yellow solid. Soluble in water.

Natamycin: Off-white to cream-colored powder, which may contain up to 3 moles of water. Soluble in glacial acetic acid and in dimethylformamide; slightly soluble in methanol; practically insoluble in water.

Nateglinide: White powder. Freely soluble in methanol and in alcohol; soluble in ether; sparingly soluble in acetone, in toluene, and in octanol; practically insoluble in water.

Nefazodone Hydrochloride: Nonhygroscopic, white powder. Freely soluble in chloroform; soluble in propylene glycol; slightly soluble in polyethylene glycol and in water.

Neomycin Sulfate: White to slightly yellow powder, or cryodesiccated solid. Is odorless or practically so and is hygroscopic. Its solutions are dextrorotatory. Freely soluble in

water; very slightly soluble in alcohol; insoluble in acetone, in chloroform, and in ether.

Netilmicin Sulfate: White to pale yellowish-white powder. Freely soluble in water; practically insoluble in dehydrated alcohol and in ether.

Nevirapine: White to off-white, odorless to nearly odorless, crystalline powder. Slightly soluble in alcohol and in methanol; practically insoluble in water. Hydrus form also slightly soluble in propylene glycol.

Niacin: White crystals or crystalline powder. Is odorless, or has a slight odor. Melts at about 235°. Freely soluble in boiling water, in boiling alcohol, and in solutions of alkali hydroxides and carbonates; sparingly soluble in water; practically insoluble in ether.

Niacinamide: White, crystalline powder. Is odorless or practically so, and has a bitter taste. Its solutions are neutral to litmus. Freely soluble in water and in alcohol; soluble in glycerin.

Nifedipine: Yellow powder. Is affected by exposure to light. Freely soluble in acetone; practically insoluble in water.

Nimodipine: Light yellow or yellow, crystalline powder, affected by light. Freely soluble in ethyl acetate; sparingly soluble in alcohol; practically insoluble in water. Exhibits polymorphism.

Nitric Acid: Highly corrosive fuming liquid, having a characteristic, highly irritating odor. Stains animal tissues yellow. Boils at about 120°. Specific gravity is about 1.41. *NF category:* Acidifying agent.

Nitrofurantoin: Lemon-yellow, odorless crystals or fine powder. Has a bitter aftertaste. Soluble in dimethylformamide; very slightly soluble in water and in alcohol.

Nitrofurazone: Lemon yellow, odorless, crystalline powder. Darkens slowly on exposure to light. Melts at about 236°, with decomposition. Soluble in dimethylformamide; slightly soluble in propylene glycol and in polyethylene glycol mixtures; very slightly soluble in alcohol and in water; practically insoluble in chloroform and in ether.

Nitrofurazone Ointment: Yellow, opaque, and water-miscible, and has ointment-like consistency.

Nitrofurazone Topical Solution: Light yellow, clear, somewhat viscous liquid, having a faint characteristic odor. Miscible with water.

Nitrogen: Colorless, odorless, tasteless gas. Is nonflammable and does not support combustion. One L at 0° and at a pressure of 760 mm of mercury weighs about 1.251 g. One volume dissolves in about 65 volumes of water and in about 9 volumes of alcohol at 20° and at a pressure of 760 mm of mercury. *NF category:* Air displacement.

Diluted Nitroglycerin: When diluted with lactose, it is a white, odorless powder. When diluted with propylene glycol or alcohol, it is a clear, colorless, or pale yellow liquid. [NOTE—Undiluted nitroglycerin occurs as a white to pale yellow, thick, flammable, explosive liquid.] Undiluted nitroglycerin is soluble in methanol, in alcohol, in carbon disulfide, in acetone, in ethyl ether, in ethyl acetate, in glacial acetic acid, in benzene, in toluene, in nitrobenzene, in phenol, in chloroform, and in methylene chloride; slightly soluble in water.

Nitromersol: Brownish yellow to yellow granules or brownish yellow to yellow powder. Is odorless and tasteless and is affected by light. Soluble in solutions of alkalis and of ammonia by opening of the anhydride ring and the formation of a salt; very slightly soluble in water, in alcohol, in acetone, and in ether.

Nitromersol Topical Solution: Clear, reddish-orange solution. Is affected by light.

Nitrous Oxide: Colorless gas, without appreciable odor or taste. One L at 0° and at a pressure of 760 mm of mercury weighs about 1.97 g. One volume dissolves in about 1.4 volumes of water at 20° and at a pressure of 760 mm of

mercury. Freely soluble in alcohol; soluble in ether and in oils.

Nizatidine: Off-white to buff crystalline solid. Freely soluble in chloroform; soluble in methanol; sparingly soluble in water.

Nonoxynol 9: Clear, colorless to light yellow, viscous liquid. Soluble in water, in alcohol, and in corn oil. *NF category:* Wetting and/or solubilizing agent.

Norepinephrine Bitartrate: White or faintly gray, odorless, crystalline powder. Slowly darkens on exposure to air and light. Its solutions are acid to litmus, having a pH of about 3.5. Freely soluble in water; slightly soluble in alcohol; practically insoluble in chloroform and in ether. Melts between 98° and 104°, without previous drying of the specimen, the melt being turbid.

Norepinephrine Bitartrate Injection: Colorless or practically colorless liquid, gradually turning dark on exposure to air and light.

Norethindrone: White to creamy white, odorless, crystalline powder. Is stable in air. Soluble in chloroform and in dioxane; sparingly soluble in alcohol; slightly soluble in ether; practically insoluble in water.

Norethindrone Acetate: White to creamy white, odorless, crystalline powder. Very soluble in chloroform; freely soluble in dioxane; soluble in ether and in alcohol; practically insoluble in water.

Norfloxacin: White to pale yellow, crystalline powder. Sensitive to light and moisture. Freely soluble in acetic acid; sparingly soluble in chloroform; slightly soluble in acetone, in water, and in alcohol; very slightly soluble in methanol and in ethyl acetate; insoluble in ether.

Norgestimate: White to pale yellow powder. Very to freely soluble in methylene chloride; sparingly soluble in acetonitrile; insoluble in water.

Norgestrel: White or practically white, practically odorless, crystalline powder. Freely soluble in chloroform; sparingly soluble in alcohol; insoluble in water.

Nortriptyline Hydrochloride: White to off-white powder, having a slight, characteristic odor. Its solution (1 in 100) has a pH of about 5. Soluble in water and in chloroform; sparingly soluble in methanol; practically insoluble in ether, in benzene, and in most other organic solvents.

Noscapine: Fine, white or practically white, crystalline powder. Freely soluble in chloroform; soluble in acetone; slightly soluble in alcohol and in ether; practically insoluble in water.

Novobiocin Calcium: White or yellowish-white, odorless, crystalline powder. Freely soluble in alcohol and in methanol; sparingly soluble in acetone and in butyl acetate; slightly soluble in water and in ether; very slightly soluble in chloroform.

Novobiocin Sodium: White or yellowish-white, odorless, hygroscopic, crystalline powder. Freely soluble in water, in alcohol, in methanol, in glycerin, and in propylene glycol; slightly soluble in butyl acetate; practically insoluble in acetone, in chloroform, and in ether.

Nystatin: Yellow to light tan powder, having an odor suggestive of cereals. Is hygroscopic, and is affected by long exposure to light, heat, and air. Freely soluble in dimethylformamide and in dimethyl sulfoxide; sparingly to slightly soluble in methanol, in *n*-propyl alcohol, and in *n*-butyl alcohol; practically insoluble in water and in alcohol; insoluble in chloroform and in ether.

Octoxynol 9: Clear, pale yellow, viscous liquid, having a faint odor and a bitter taste. Soluble in benzene and in toluene; practically insoluble in solvent hexane. Miscible with water, with alcohol, and with acetone. *NF category:* Wetting and/or solubilizing agent.

Octyldodecanol: Clear water-white, free-flowing liquid. Soluble in alcohol and in ether; insoluble in water. *NF category:* Vehicle (oleaginous).

Octyl Methoxycinnamate: Pale yellow oil. Insoluble in water.

Ofloxacin: Pale yellowish-white to light yellowish-white crystals or crystalline powder. Sparingly soluble in chloroform; slightly soluble in alcohol, in methanol, and in water.

Hydrophilic Ointment: *NF category:* Ointment base.

White Ointment: *NF category:* Ointment base.

Yellow Ointment: *NF category:* Ointment base.

Olanzapine: A yellow crystalline solid. Soluble in *n*-propanol; sparingly soluble in acetonitrile; slightly soluble in methanol and in dehydrated alcohol; practically insoluble in water.

Oleic Acid: Colorless to pale yellow, oily liquid when freshly prepared, but on exposure to air it gradually absorbs oxygen and darkens. Has a characteristic, lard-like odor and taste. When strongly heated in air, it is decomposed with the production of acid vapors. Practically insoluble in water. Miscible with alcohol, with chloroform, with ether, with benzene, and with fixed and volatile oils. *NF category:* Emulsifying and/or solubilizing agent.

Oleovitamin A and D: Yellow to red, oily liquid, practically odorless or having a fish-like odor, and having no rancid odor or taste. Is a clear liquid at temperatures exceeding 65°, and may crystallize on cooling. Is unstable in air and in light. Very soluble in ether and in chloroform; soluble in dehydrated alcohol and in vegetable oils; insoluble in water and in glycerin.

Oleovitamin A and D Capsules: The oil contained in Oleovitamin A and D Capsules is a yellow to red, oily liquid, practically odorless or having a fish-like odor, and having no rancid odor or taste. Is a clear liquid at temperatures exceeding 65°, and may crystallize on cooling. Is unstable in air and in light.

Oleoyl Polyoxylglycerides: Amber, oily liquids. May develop deposit after prolonged storage at 20°. Freely soluble in methylene chloride; practically insoluble but dispersible in water. *NF category:* Ointment base; solvent.

Oleyl Alcohol: Clear, colorless to light yellow, oily liquid. Has a faint characteristic odor and a bland taste. Soluble in alcohol, in ether, in isopropyl alcohol, and in light mineral oil; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent.

Oleyl Oleate: Clear, colorless to light yellow liquid. Has a faint characteristic odor. Slightly soluble in alcohol. Miscible with chloroform and with ether. *NF category:* Emollient; emulsifying and/or solubilizing agent.

Olive Oil: Pale yellow, or light greenish-yellow, oily liquid, having a slight, characteristic odor and taste, with a faintly acrid aftertaste. Slightly soluble in alcohol. Miscible with ether, with chloroform, and with carbon disulfide. *Specific gravity* (841): Between 0.910 and 0.915. *NF category:* Vehicle (oleaginous).

Olmesartan Medoxomil: White to off-white crystalline powder. Sparingly soluble in methanol; practically insoluble in water.

Olopatadine Hydrochloride: White crystalline powder. Very soluble in formic acid; sparingly soluble in water; very slightly soluble in dehydrated alcohol.

Omeprazole: White to off-white powder. Melts between 150° and 160°, with decomposition. Soluble in dichloromethane; sparingly soluble in methanol and in alcohol; very slightly soluble in water.

Omeprazole Magnesium: White to off-white powder. Sparingly soluble in methanol; slightly soluble in alcohol; very slightly soluble in water and in dichloromethane.

Ondansetron: White to off-white powder. Very soluble in acid solutions; sparingly soluble in water.

Ondansetron Hydrochloride: White to off-white powder. Soluble in methanol; sparingly soluble in water and in alcohol; slightly soluble in isopropyl alcohol and in dichloro-

methane; very slightly soluble in acetone, in chloroform, and in ethyl acetate.

Opium: Has a very characteristic odor and a very bitter taste.

Powdered Opium: Light brown or moderately yellowish-brown powder.

Orbifloxacin: White to pale yellow crystals or crystalline powder. Odorless. Soluble in acetic acid; very slightly soluble in methanol, in water, and in chloroform; practically insoluble in ethanol and in diethyl ether.

Orlistat: White to off-white fine powder or fine powder with lumps. Freely soluble in chloroform; very soluble in methanol and in alcohol; practically insoluble in water.

Orphenadrine Citrate: White, practically odorless, crystalline powder, having a bitter taste. Sparingly soluble in water; slightly soluble in alcohol; insoluble in chloroform, in benzene, and in ether.

Osetamivir Phosphate: White to off-white powder. Freely soluble in water; soluble in methanol, in dimethyl sulfoxide, and in propylene glycol; sparingly soluble in dimethylformamide; slightly soluble in alcohol; very slightly soluble in isopropyl alcohol and in polyethylene glycol 400; practically insoluble in acetonitrile, in acetone, in dichloromethane, and in *n*-hexane.

Oxacillin Sodium: Fine, white, crystalline powder, odorless or having a slight odor. Freely soluble in water, in methanol, and in dimethyl sulfoxide; slightly soluble in absolute alcohol, in chloroform, in pyridine, and in methyl acetate; insoluble in ethyl acetate, in ether, in benzene, and in ethylene chloride.

Oxacillin Sodium for Injection: Fine, white, crystalline powder, odorless or having a slight odor. Freely soluble in water, in methanol, and in dimethyl sulfoxide; slightly soluble in absolute alcohol, in chloroform, in pyridine, and in methyl acetate; insoluble in ethyl acetate, in ether, in benzene, and in ethylene chloride.

Oxaliplatin: White to off-white crystalline powder. Slightly soluble in water; very slightly soluble in methanol; practically insoluble in alcohol.

Oxandrolone: White, odorless, crystalline powder. Is stable in air, but darkens on exposure to light. Melts at about 225°. Freely soluble in chloroform; sparingly soluble in alcohol and in acetone; practically insoluble in water.

Oxaprozin: White to yellowish-white, crystalline powder.

Oxazepam: Creamy white to pale yellow powder. Is practically odorless. Slightly soluble in alcohol and in chloroform; very slightly soluble in ether; practically insoluble in water.

Oxcarbazepine: Light orange to creamish white or off-white powder. Soluble in acetic acid; sparingly soluble in chloroform; practically insoluble in water.

Oxfendazole: White or almost white powder. Slightly soluble in alcohol and in methylene chloride; practically insoluble in water.

Oxprenolol Hydrochloride: White, crystalline powder. Freely soluble in alcohol, in chloroform, and in water; sparingly soluble in acetone; practically insoluble in ether.

Oxtriphylline: White, crystalline powder, having an amine-like odor. A solution (1 in 100) has a pH of about 10.3. Freely soluble in water and in alcohol; very slightly soluble in chloroform.

Oxybenzone: Pale yellow powder. Freely soluble in alcohol and in toluene; practically insoluble in water.

Oxybutynin Chloride: White, crystalline, practically odorless powder. Very soluble in methanol and in chloroform; freely soluble in water and in alcohol; soluble in acetone; slightly soluble in ether; very slightly soluble in hexane.

Oxycodone Hydrochloride: White to off-white, hygroscopic crystals or powder. Is odorless. Soluble in water; slightly soluble in alcohol.

Oxygen: Colorless, odorless, tasteless gas, which supports combustion more energetically than does air. One L at 0° and at a pressure of 760 mm of mercury weighs about 1.429 g. One volume dissolves in about 32 volumes of water and in about 7 volumes of alcohol at 20° and at a pressure of 760 mm of mercury.

Oxymetazoline Hydrochloride: White to practically white, fine crystalline powder. Is hygroscopic. Melts at about 300°, with decomposition. Soluble in water and in alcohol; practically insoluble in benzene, in chloroform, and in ether.

Oxymetholone: White to creamy white, crystalline powder. Is odorless, and is stable in air. Freely soluble in chloroform; soluble in dioxane; sparingly soluble in alcohol; slightly soluble in ether; practically insoluble in water.

Oxymorphone Hydrochloride: White or slightly off-white, odorless powder. Darkens on exposure to light. Its aqueous solutions are slightly acidic. Freely soluble in water; sparingly soluble in alcohol and in ether.

Oxyquinoline Sulfate: Yellow powder. Melts at about 185°. Very soluble in water; freely soluble in methanol; slightly soluble in alcohol; practically insoluble in acetone and in ether. *NF category:* Complexing agent.

Oxytetracycline: Pale yellow to tan, odorless, crystalline powder. Is stable in air, but exposure to strong sunlight causes it to darken. It loses potency in solutions of pH below 2, and is rapidly destroyed by alkali hydroxide solutions. Freely soluble in 3 N hydrochloric acid and in alkaline solutions; sparingly soluble in alcohol; very slightly soluble in water.

Oxytetracycline Calcium: Yellow to light brown, crystalline powder. Insoluble in water.

Oxytetracycline Hydrochloride: Yellow, odorless, crystalline powder, having a bitter taste. Is hygroscopic. Decomposes at a temperature exceeding 180°, and exposure to strong sunlight or to temperatures exceeding 90° in moist air causes it to darken. Its potency is diminished in solutions having a pH below 2, and is rapidly destroyed by alkali hydroxide solutions. Freely soluble in water, but crystals of oxytetracycline base separate as a result of partial hydrolysis of the hydrochloride; sparingly soluble in alcohol and in methanol, and even less soluble in dehydrated alcohol; insoluble in chloroform and in ether.

Paclitaxel: White to off-white powder. Soluble in alcohol; insoluble in water.

Padimate O: A light yellow, mobile liquid having a faint, aromatic odor. Soluble in alcohol, in isopropyl alcohol, and in mineral oil; practically insoluble in water, in glycerin, and in propylene glycol.

Palm Oil: White to yellowish, fatty solid to semisolid. Insoluble in water. *NF category:* Coating agent; emulsifying and/or solubilizing agent.

Hydrogenated Palm Oil: White to yellowish, fatty solid to semi-solid. Freely soluble in ether; very slightly soluble in alcohol; practically insoluble in water. *NF category:* Coating agent; tablet binder; tablet and/or capsule lubricant.

Palm Kernel Oil: White to yellowish, fatty solid. Insoluble in water. *NF category:* Coating agent; emulsifying and/or solubilizing agent.

Palmitic Acid: Hard, white or faintly yellow, somewhat glossy crystalline solid, or white or yellowish-white powder. It has a slight characteristic odor and taste. Soluble in alcohol, in ether, and in chloroform; practically insoluble in water.

Pamidronate Disodium: White, crystalline powder. Soluble in water and in 2 N sodium hydroxide; sparingly soluble in 0.1 N hydrochloric acid and in 0.1 N acetic acid; practically insoluble in organic solvents.

Pancreatin: Cream-colored, amorphous powder, having a faint, characteristic, but not offensive odor. It hydrolyzes fats to glycerol and fatty acids, changes protein into proteoses and derived substances, and converts starch into dextrins and sugars. Its greatest activities are in neutral or faintly alkaline media; more than traces of mineral acids or large amounts of alkali hydroxides make it inert. An excess of alkali carbonate also inhibits its action.

Pancrelipase: Cream-colored, amorphous powder, having a faint, characteristic, but not offensive odor. Pancrelipase hydrolyzes fats to glycerol and fatty acids, changes protein into proteoses and derived substances, and converts starch into dextrins and sugars. Its greatest activities are in neutral or faintly alkaline media; more than traces of mineral acids or large amounts of alkali hydroxides make it inert. An excess of alkali carbonate also inhibits its action.

Pancrelipase Capsules: The contents of Capsules conform to the *Description* under *Pancrelipase*, except that the odor may vary with the flavoring agent used.

Pancuronium Bromide: White, yellowish-white, or slightly pink, crystalline powder. Is hygroscopic. Freely soluble in water, in methylene chloride, and in alcohol.

Panthanol: White to creamy white, crystalline powder having a slight, characteristic odor. Freely soluble in water, in alcohol, and in propylene glycol; soluble in chloroform and in ether; slightly soluble in glycerin.

Pantoprazole Sodium: White to off-white powder. Freely soluble in water, in methanol, and in dehydrated alcohol; practically insoluble in hexane and in dichloromethane.

Papain: White to light tan, amorphous powder. Soluble in water, the solution being colorless to light yellow and more or less opalescent; practically insoluble in alcohol, in chloroform, and in ether.

Papaverine Hydrochloride: White crystals or white, crystalline powder. Is odorless, and has a slightly bitter taste. Is optically inactive. Its solutions are acid to litmus. Melts at about 220°, with decomposition. Soluble in water and in chloroform; slightly soluble in alcohol; practically insoluble in ether.

Parachlorophenol: White or pink crystals having a characteristic phenolic odor. When undiluted, it whitens and cauterizes the skin and mucous membranes. Melts at about 42°. Very soluble in alcohol, in glycerin, in chloroform, in ether, and in fixed and volatile oils; soluble in petrolatum; sparingly soluble in water and in liquid petrolatum.

Paraffin: Colorless or white, more or less translucent mass showing a crystalline structure. Is odorless and tasteless, and is slightly greasy to the touch. Freely soluble in chloroform, in ether, in volatile oils, and in most warm fixed oils; slightly soluble in dehydrated alcohol; insoluble in water and in alcohol. *NF category:* Stiffening agent.

Synthetic Paraffin: Very hard, white, practically tasteless and odorless wax. Contains mostly long-chain, unbranched, saturated hydrocarbons, with a small amount of branched hydrocarbons. Is represented by the formula C_nH_{2n+2} , in which n may range from 20 to about 100. The average molecular weight may range from 400 to 1400. Slightly soluble in aromatic and normal paraffinic solvents; very slightly soluble in aliphatic, oxygenated, and halogenated hydrocarbon solvents; insoluble in water. *NF category:* Stiffening agent.

Paraldehyde: Colorless, transparent liquid. Has a strong, characteristic but not unpleasant or pungent odor, and a disagreeable taste. Specific gravity is about 0.99. Soluble in water, but less soluble in boiling water. Miscible with alcohol, with chloroform, with ether, and with volatile oils.

Paricalcitol: White to almost white powder. Soluble in alcohol; insoluble in water.

Paromomycin Sulfate: Creamy white to light yellow powder. Is odorless or practically odorless, and is very hy-

groscopic. Very soluble in water; insoluble in alcohol, in chloroform, and in ether.

Paroxetine Hydrochloride: White to off-white solid. Soluble in methanol and in alcohol; slightly soluble in water.

Peanut Oil: Colorless or pale yellow, oily liquid with a bland taste. May have a characteristic, nutty odor. Very slightly soluble in alcohol. Miscible with ether, with chloroform, and with carbon disulfide. *Specific gravity* (841): Between 0.912 and 0.920. *Refractive index* (831): Between 1.462 and 1.464 at 40°. *NF category:* Solvent; vehicle (oleaginous).

Pectin: Coarse or fine powder, yellowish-white in color, almost odorless, and having a mucilaginous taste. Soluble in 20 parts of water, forming a viscous, opalescent, colloidal solution that flows readily and is acid to litmus; practically insoluble in alcohol or in diluted alcohol and in other organic solvents. Pectin dissolves in water more readily if first moistened with alcohol, glycerin, or simple syrup, or if first mixed with 3 or more parts of sucrose. *NF category:* Suspending and/or viscosity-increasing agent.

Penbutolol Sulfate: White to off-white, crystalline powder. Melts at about 217°, with decomposition. Soluble in water and in methanol.

Penicillamine: White or practically white, crystalline powder, having a slight, characteristic odor. Freely soluble in water; slightly soluble in alcohol; insoluble in chloroform and in ether.

Penicillin G Benzathine: White, odorless, crystalline powder. Sparingly soluble in alcohol; very slightly soluble in water.

Penicillin G Potassium: Colorless or white crystals, or white, crystalline powder. Is odorless or practically so, and is moderately hygroscopic. Its solutions are dextrorotatory. Its solutions retain substantially full potency for several days at temperatures below 15°, but are rapidly inactivated by acids, by alkali hydroxides, by glycerin, and by oxidizing agents. Very soluble in water, in saline TS, and in dextrose solutions; sparingly soluble in alcohol.

Penicillin G Procaine: White crystals or white, very fine, microcrystalline powder. Is odorless or practically odorless, and is relatively stable in air. Its solutions are dextrorotatory. Is rapidly inactivated by acids, by alkali hydroxides, and by oxidizing agents. Soluble in alcohol and in chloroform; slightly soluble in water.

Penicillin G Sodium: Colorless or white crystals or white to slightly yellow, crystalline powder. Is odorless or practically odorless, and is moderately hygroscopic. Its solutions are dextrorotatory. Is relatively stable in air, but is inactivated by prolonged heating at about 100°, especially in the presence of moisture. Its solutions lose potency fairly rapidly at room temperature, but retain substantially full potency for several days at temperatures below 15°. Its solutions are rapidly inactivated by acids, by alkali hydroxides, by oxidizing agents, and by penicillinase.

Penicillin V: White, odorless, crystalline powder. Freely soluble in alcohol and in acetone; very slightly soluble in water; insoluble in fixed oils.

Penicillin V Benzathine: Practically white powder, having a characteristic odor. Sparingly soluble in chloroform; slightly soluble in alcohol and in ether; very slightly soluble in water.

Penicillin V Potassium: White, odorless, crystalline powder. Very soluble in water; slightly soluble in alcohol; insoluble in acetone.

Pentamidine Isethionate: White or almost white powder or colorless crystals, hygroscopic. Freely soluble in water; sparingly soluble in alcohol; practically insoluble in methylene chloride.

Pentazocine: White or very pale, tan-colored powder. Freely soluble in chloroform; soluble in alcohol, in acetone, and in ether; sparingly soluble in benzene and in ethyl acetate; practically insoluble in water.

Pentazocine Hydrochloride: White, crystalline powder. It exhibits polymorphism, one form melting at about 254° and the other at about 218°. Freely soluble in chloroform; soluble in alcohol; sparingly soluble in water; very slightly soluble in acetone and in ether; practically insoluble in benzene.

Pentetic Acid: White, odorless or almost odorless powder. Melts with foaming and degradation at 220°.

Pentobarbital: White to practically white, fine, practically odorless powder. May occur in a polymorphic form that melts at about 116°. This form gradually reverts to the more stable higher-melting form upon being heated at about 110°. Very soluble in alcohol, in methanol, in ether, in chloroform, and in acetone; soluble in benzene; very slightly soluble in water and in carbon tetrachloride.

Pentobarbital Sodium: White, crystalline granules or white powder. Is odorless or has a slight characteristic odor, and has a slightly bitter taste. Its solutions decompose on standing, heat accelerating the decomposition. Very soluble in water; freely soluble in alcohol; practically insoluble in ether.

Pentoxifylline: White to almost white crystalline powder. Freely soluble in chloroform and in methanol; soluble in water; sparingly soluble in alcohol; slightly soluble in ether.

Peppermint: Has an aromatic, characteristic odor and a pungent taste, and produces a cooling sensation in the mouth. *NF category:* Flavors and perfumes.

Peppermint Oil: Colorless or pale yellow liquid, having a strong, penetrating, characteristic odor and a pungent taste, followed by a sensation of cold when air is drawn into the mouth. *NF category:* Flavors and perfumes.

Peppermint Spirit: A clear, colorless liquid with a peppermint fragrance. Freely soluble in methanol and in diethyl ether; soluble in water. *NF category:* Flavors and perfumes.

Peppermint Water: *NF category:* Vehicle (flavored and/or sweetened).

Perflubron: Clear, colorless, practically odorless liquid.

Pergolide Mesylate: White to off-white powder. Sparingly soluble in methanol; slightly soluble in water, in dehydrated alcohol, and in chloroform; very slightly soluble in acetone; practically insoluble in ether.

Perphenazine: White to creamy white, odorless powder. Freely soluble in alcohol and in chloroform; soluble in acetone; practically insoluble in water.

Pertussis Immune Globulin: Transparent or slightly opalescent liquid, practically colorless, free from turbidity or particles, and practically odorless. May develop a slight, granular deposit during storage. Is standardized for agglutinating activity with the U.S. Standard Antipertussis Serum.

Petrolatum: Unctuous yellowish to light amber mass, having not more than a slight fluorescence even after being melted. Is transparent in thin layers. Is free or practically free from odor and taste. Freely soluble in benzene, in carbon disulfide, in chloroform, and in turpentine oil; soluble in ether, in solvent hexane, and in most fixed and volatile oils; practically insoluble in cold and hot alcohol and in cold dehydrated alcohol; insoluble in water. *NF category:* Ointment base.

Hydrophilic Petrolatum: *NF category:* Ointment base.

White Petrolatum: White or faintly yellowish, unctuous mass, transparent in thin layers even after cooling to 0°. Freely soluble in benzene, in carbon disulfide, and in chloroform; soluble in ether, in solvent hexane, and in most fixed and volatile oils; slightly soluble in cold or hot alcohol, and in cold dehydrated alcohol; insoluble in water. *NF category:* Ointment base.

Phenazopyridine Hydrochloride: Light or dark red to dark violet, crystalline powder. Is odorless, or has a slight odor. Melts at about 235°, with decomposition. Slightly soluble in water, in alcohol, and in chloroform.

Phendimetrazine Tartrate: White, odorless, crystalline powder. Freely soluble in water; sparingly soluble in warm alcohol; insoluble in chloroform, in acetone, in ether, and in benzene. Phendimetrazine base is extracted by organic solvents from alkaline solution.

Phenelzine Sulfate: White to yellowish white powder, having a characteristic odor. Freely soluble in water; practically insoluble in alcohol, in chloroform, and in ether.

Pheniramine Maleate: White, crystalline powder having a faint amine-like odor. Soluble in water and in alcohol.

Phenmetrazine Hydrochloride: White to off-white, crystalline powder. Very soluble in water; freely soluble in alcohol and in chloroform.

Phenobarbital: White, odorless, glistening, small crystals, or white, crystalline powder, which may exhibit polymorphism. Is stable in air. Its saturated solution has a pH of about 5. Soluble in alcohol, in ether, and in solutions of fixed alkali hydroxides and carbonates; sparingly soluble in chloroform; very slightly soluble in water.

Phenobarbital Sodium: Flaky crystals, or white, crystalline granules, or white powder. Is odorless, has a bitter taste, and is hygroscopic. Its solutions are alkaline to phenolphthalein TS, and decompose on standing. Very soluble in water; soluble in alcohol; practically insoluble in ether and in chloroform.

Phenol: Colorless to light pink, interlaced or separate, needle-shaped crystals, or white to light pink, crystalline mass. Has a characteristic odor. Is liquefied by warming and by the addition of 10% of water. Boils at about 182°, and its vapor is flammable. Gradually darkens on exposure to light and air. Very soluble in alcohol, in glycerin, in chloroform, in ether, and in fixed and volatile oils; soluble in water; sparingly soluble in mineral oil. *NF category:* Antimicrobial preservative.

Liquefied Phenol: Colorless to pink liquid, which may develop a red tint upon exposure to air or light. Has a characteristic, somewhat aromatic odor. It whitens and cauterizes the skin and mucous membranes. Specific gravity is about 1.065. Miscible with alcohol, with ether, and with glycerin. A mixture of equal volumes of Liquefied Phenol and glycerin is miscible with water.

Camphorated Phenol Topical Gel: Clear, colorless, oily gel.

Phenolsulfonphthalein: A bright-red to dark-red, crystalline powder. Slightly soluble in alcohol; very slightly soluble in water.

Phenoxyethanol: A colorless, slightly viscous liquid. Slightly soluble in water, in peanut oil, and in olive oil. Miscible with acetone, with alcohol, and with glycerol. *NF category:* Antimicrobial preservative.

Phensuximide: White to off-white, crystalline powder. Is odorless, or has not more than a slight odor. Very soluble in chloroform; soluble in alcohol; slightly soluble in water.

Phentermine Hydrochloride: White, odorless, hygroscopic, crystalline powder. Soluble in water and in the lower alcohols; slightly soluble in chloroform; insoluble in ether.

Phentolamine Mesylate: White or off-white, odorless, crystalline powder. Its solutions are acid to litmus, having a pH of about 5, and slowly deteriorate. Melts at about 178°. Freely soluble in water and in alcohol; slightly soluble in chloroform.

Phenylalanine: White, odorless crystals, having a slightly bitter taste. Sparingly soluble in water; very slightly soluble in methanol, in alcohol, and in dilute mineral acids.

Phenylbenzimidazole Sulfonic Acid: White to ivory-colored, odorless powder. Soluble in alcohol; practically insoluble in oily solvents and in water. Its salts are freely soluble in water.

Phenylbutazone: White to off-white, odorless, crystalline powder. Freely soluble in acetone and in ether; soluble in alcohol; very slightly soluble in water.

Phenylephrine Bitartrate: White or almost white powder or colorless crystals. Freely soluble in water.

Phenylephrine Hydrochloride: White or practically white, odorless crystals, having a bitter taste. Freely soluble in water and in alcohol.

Phenylephrine Hydrochloride Nasal Solution: Clear, colorless or slightly yellow, odorless liquid. Is neutral or acid to litmus.

Phenylephrine Hydrochloride Ophthalmic Solution: Clear, colorless or slightly yellow liquid, depending on the concentration.

Phenylethyl Alcohol: Colorless liquid, having a rose-like odor and a sharp, burning taste. Very soluble in alcohol, in fixed oils, in glycerin, and in propylene glycol; sparingly soluble in water; slightly soluble in mineral oil. *NF category:* Antimicrobial preservative.

Phenylmercuric Acetate: White to creamy white, crystalline powder, or small white prisms or leaflets. Is odorless. Soluble in alcohol and in acetone; slightly soluble in water. *NF category:* Antimicrobial preservative.

Phenylmercuric Nitrate: White, crystalline powder. Is affected by light. Its saturated solution is acid to litmus. Slightly soluble in alcohol and in glycerin; very slightly soluble in water. It is more soluble in the presence of either nitric acid or alkali hydroxides. *NF category:* Antimicrobial preservative.

Phenylpropanolamine Bitartrate: White, crystalline powder.

Phenylpropanolamine Hydrochloride: White, crystalline powder, having a slight aromatic odor. Is affected by light. Freely soluble in water and in alcohol; insoluble in ether.

Phenyltoloxamine Citrate: White, crystalline powder. Very soluble in boiling water; slightly soluble in cold water and in alcohol; practically insoluble in cold acetone, in ethyl ether, and in toluene.

Phenytol: White, odorless powder. Melts at about 295°. Soluble in hot alcohol; slightly soluble in cold alcohol, in chloroform, and in ether; practically insoluble in water.

Phenytol Sodium: White, odorless powder. Is somewhat hygroscopic and on exposure to air gradually absorbs carbon dioxide. Freely soluble in water, the solution usually being somewhat turbid due to partial hydrolysis and absorption of carbon dioxide; soluble in alcohol; practically insoluble in ether and in chloroform.

Sodium Phosphate P 32 Solution: Clear, colorless solution. Upon standing, both the Solution and the glass container may darken as a result of the effects of the radiation.

Phosphoric Acid: Colorless, odorless liquid of syrupy consistency. Specific gravity is about 1.71. Miscible with water and with alcohol. *NF category:* Acidifying agent; buffering agent.

Diluted Phosphoric Acid: Clear, colorless, odorless liquid. Specific gravity is about 1.057. *NF category:* Acidifying agent.

Physostigmine: White, odorless, microcrystalline powder. Acquires a red tint when exposed to heat, light, air, or contact with traces of metals. Melts at a temperature not lower than 103°. Very soluble in chloroform and in dichloromethane; freely soluble in alcohol; soluble in benzene and in fixed oils; slightly soluble in water.

Physostigmine Salicylate: White, shining, odorless crystals or white powder. Acquires a red tint when exposed to heat, light, air, or contact with traces of metals for long periods. Melts at about 184°. Freely soluble in chloroform; soluble in alcohol; sparingly soluble in water; slightly soluble in ether.

Physostigmine Sulfate: White, odorless, microcrystalline powder. Is deliquescent in moist air and acquires a red tint when exposed to heat, light, air, or contact with traces of metals for long periods. Melts at about 143°. Freely solu-

ble in water; very soluble in alcohol; very slightly soluble in ether.

Phytonadione: Clear, yellow to amber, very viscous, odorless or practically odorless liquid, having a specific gravity of about 0.967. Is stable in air, but decomposes on exposure to sunlight. Soluble in dehydrated alcohol, in benzene, in chloroform, in ether, and in vegetable oils; slightly soluble in alcohol; insoluble in water.

Pilocarpine: A viscous, oily liquid, or crystals melting at about 34°. Exceedingly hygroscopic. Soluble in water, in alcohol, and in chloroform; sparingly soluble in ether and in benzene; practically insoluble in petroleum ether.

Pilocarpine Hydrochloride: Colorless, translucent, odorless, faintly bitter crystals. Is hygroscopic and is affected by light. Its solutions are acid to litmus. Very soluble in water; freely soluble in alcohol; slightly soluble in chloroform; insoluble in ether.

Pilocarpine Nitrate: Shining, white crystals. Is stable in air but is affected by light. Its solutions are acid to litmus. Freely soluble in water; sparingly soluble in alcohol; insoluble in chloroform and in ether.

Pimozide: White, crystalline powder. Freely soluble in chloroform; slightly soluble in ether and in alcohol; insoluble in water.

Pindolol: White to off-white, crystalline powder, having a faint odor. Slightly soluble in methanol; very slightly soluble in chloroform; practically insoluble in water.

Pioglitazone Hydrochloride: White crystals or crystalline powder. Soluble in dimethylformamide; slightly soluble in dehydrated alcohol; very slightly soluble in acetone and in acetonitrile; practically insoluble in water; insoluble in ether.

Piperacillin: White to off-white, crystalline powder. Very soluble in methanol; slightly soluble in isopropyl alcohol; very slightly soluble in ethyl acetate and in water.

Piperacillin Sodium: White to off-white solid. Freely soluble in water and in alcohol.

Piperazine: White to slightly off-white lumps or flakes, having an ammoniacal odor. Soluble in water and in alcohol; insoluble in ether.

Piperazine Adipate: White crystalline powder. Soluble in water; practically insoluble in alcohol.

Piperazine Citrate: White, crystalline powder, having not more than a slight odor. Its solution (1 in 10) has a pH of about 5. Soluble in water; insoluble in alcohol and in ether.

Piperazine Dihydrochloride: White crystalline powder. Soluble in water.

Piperazine Phosphate: White crystalline powder. Sparingly soluble in water; practically insoluble in alcohol.

Piroxicam: Off-white to light tan or light yellow, odorless powder. Forms a monohydrate that is yellow. Slightly soluble in alcohol and in aqueous alkaline solutions; very slightly soluble in water, in dilute acids, and in most organic solvents.

Plantago Seed: All varieties are practically odorless and have a bland, mucilaginous taste.

Plicamycin: Yellow, odorless, hygroscopic, crystalline powder. Freely soluble in ethyl acetate; slightly soluble in water and in methanol; very slightly soluble in alcohol.

Podophyllum: Has a slight odor and a disagreeably bitter and acrid taste.

Podophyllum Resin: Amorphous powder, varying in color from light brown to greenish yellow, turning darker when subjected to a temperature exceeding 25° or when exposed to light. Has a slight, peculiar, faintly bitter taste. Its alcohol solution is acid to moistened litmus paper. Soluble in alcohol with a slight opalescence; partially soluble in ether and in chloroform.

Polacrilin Potassium: White to off-white, free-flowing powder. Has a faint odor or is odorless. Insoluble in water and in most liquids. *NF category:* Tablet disintegrant.

Poliovirus Vaccine Inactivated: Clear, reddish-tinged or yellowish liquid, that may have a slight odor because of the preservative.

Poloxalene: Colorless or pale yellow liquid. Soluble in water, in chloroform, and in ethylene dichloride.

Poloxamer: *NF category:* Emulsifying and/or solubilizing agent; wetting and/or solubilizing agent.

Poloxamer 124: Colorless liquid, having a mild odor. When solidified, it melts at about 16°. Freely soluble in water, in alcohol, in isopropyl alcohol, in propylene glycol, and in xylene.

Poloxamer 188: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about 52°. Freely soluble in water and in alcohol.

Poloxamer 237: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about 49°. Freely soluble in water and in alcohol; sparingly soluble in isopropyl alcohol and in xylene.

Poloxamer 338: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about 57°. Freely soluble in water and in alcohol; sparingly soluble in propylene glycol.

Poloxamer 407: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about 56°. Freely soluble in water, in alcohol, and in isopropyl alcohol.

Polycarbophil: White to creamy white granules, having a characteristic, ester-like odor. Swells in water to a range of volumes, depending primarily on the pH. Insoluble in water, in dilute acids, in dilute alkalies, and in common organic solvents.

Hydrogenated Polydecene: Clear, colorless, odorless, tasteless liquid. Very slightly soluble in water. *NF category:* Emollient; ointment base; solvent; vehicle (oleaginous).

Polydextrose: Off-white to light tan-colored solid. Very soluble in water; soluble in alcohol; slightly soluble in glycerin and in propylene glycol. *NF category:* Bulking agent; humectant.

Hydrogenated Polydextrose: Off-white to light tan-colored solid. Very soluble in water; soluble in alcohol; slightly soluble in glycerin and in propylene glycol. *NF category:* Bulking agent; coating agent; humectant; tablet binder; suspending and/or viscosity-increasing agent.

Polyethylene Glycol: Polyethylene Glycol is usually designated by a number that corresponds approximately to its average molecular weight. As the average molecular weight increases, the water solubility, vapor pressure, hygroscopicity, and solubility in organic solvents decrease, while congealing temperature, specific gravity, flash point, and viscosity increase. Liquid grades occur as clear to slightly hazy, colorless or practically colorless, slightly hygroscopic, viscous liquids, having a slight, characteristic odor, and a specific gravity at 25° of about 1.12. Solid grades occur as practically odorless and tasteless, white, waxy, plastic material having a consistency similar to beeswax, or as creamy white flakes, beads, or powders. The accompanying table states the approximate congealing temperatures that are characteristic of commonly available grades. Liquid grades are miscible with water; solid grades are freely soluble in water; and all are soluble in acetone, in alcohol, in chloroform, in ethylene glycol monoethyl ether, in ethyl acetate, and in toluene; all are insoluble in ether and in hexane. *NF category:* Coating agent; plasticizer; solvent; suppository base; tablet and/or capsule lubricant.

3350	56
4500	58
8000	60

Polyethylene Glycol Monomethyl Ether: Polyethylene Glycol Monomethyl Ether is usually designated by a number that corresponds approximately to its average molecular weight. As the average molecular weight increases, the water solubility, vapor pressure, hygroscopicity, and solubility in organic solvents decrease, while congealing temperature, specific gravity, flash point, and viscosity increase. Liquid grades occur as clear to slightly hazy, colorless or practically colorless, slightly hygroscopic, viscous liquids, having a slight, characteristic odor, and a specific gravity at 25° of about 1.09 – 1.10. Solid grades occur as practically odorless and tasteless, white, waxy, plastic material having a consistency similar to beeswax, or as creamy white flakes, beads, or powders. The accompanying table states the approximate congealing temperatures that are characteristic of commonly available grades. Liquid grades are miscible with water; solid grades are freely soluble in water; and all are soluble in acetone, in alcohol, in chloroform, in ethylene glycol monoethyl ether, in ethyl acetate, and in toluene; all are insoluble in ether and in hexane. *NF category:* Ointment base; solvent; plasticizer.

Polyethylene Oxide: Polyethylene oxide resins are high molecular weight polymers having the common structure:

in which n , the degree of polymerization, varies from about 2000 to over 100,000. Polyethylene oxide, being a polyether, strongly hydrogen bonds with water. It is nonionic and undergoes salting-out effects associated with neutral molecules in solutions of high dielectric media. Salting-out effects manifest themselves in depressing the upper temperature limit of solubility, and in reducing the viscosity of both dilute and concentrated solutions of the polymers. All molecular weight grades are powdered or granular solids. They are soluble in water but, because of the high solution viscosities obtained (see *table*), solutions over 1% in water may be difficult to prepare. The water solubility, hygroscopicity, solubility in organic solvents, and melting point do not vary in the specified molecular weight range. At room temperature polyethylene oxide is miscible with water in all proportions. At concentrations of about 20% polymer in water, the solutions are nontacky, reversible, elastic gels. At higher concentrations, the solutions are tough, elastic materials with the water acting as a plasticizer. Polyethylene oxide is also freely soluble in acetonitrile, in ethylene dichloride, in trichloroethylene, and in methylene chloride. Heating may be required to obtain solutions in many other organic solvents. It is insoluble in aliphatic hydrocarbons, in ethylene glycol, in di-

ethylene glycol, and in glycerol. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder.

Approximate Molecular Weight	Typical Solution Viscosity (cps), 25°	
	5% Solution	1% Solution
100,000	40

5,000,000		5500

Polyethylene 50 Stearate: *NF category:* Emulsifying and/or solubilizing agent.

Polyglyceryl 3 Diisostearate: Viscous liquid. Soluble in alcohol, in methylene chloride, in mineral oil, and in vegetable oils; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; ointment base.

Polyglyceryl Dioleate: Viscous liquid. Soluble in methylene chloride, in mineral oil, and in vegetable oils; sparingly soluble in alcohol; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent.

Polyisobutylene: Low molecular-weight grades are soft and gummy; high molecular-weight grades are tough and elastic. All grades are light in color, odorless, and tasteless. Soluble in diisobutylene, in toluene, and in chloroform; insoluble in water.

Polymyxin B Sulfate: White to buff-colored powder. Is odorless or has a faint odor. Freely soluble in water; slightly soluble in alcohol.

Polyoxyl Lauryl Ether: A material with 3–5 oxyethylene units per molecule is a colorless liquid. Soluble or dispersible in alcohol; practically insoluble in water and in hexane. A material with 9–23 oxyethylene units per molecule is a white, waxy mass. Soluble or dispersible in water; soluble in alcohol; practically insoluble in hexane. *NF category:* Emulsifying and/or solubilizing agent.

Polyoxyl Oleate: A slightly yellowish, viscous liquid. Dispersible in water and in oils. Soluble in alcohol and in isopropyl alcohol. Miscible with fatty oils and with waxes. Its refractive index is about 1.466.

Polyoxyl 10 Oleyl Ether: White, soft semisolid, or pale yellow liquid, having a bland odor. Soluble in water and in alcohol. Dispersible in mineral oil and in propylene glycol, with possible separation on standing. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polyoxyl 15 Hydroxystearate: Yellowish to white waxy mass. Very soluble in water; soluble in alcohol and in 2-propanol; insoluble in mineral oil. It solidifies at 25°. *NF category:* Tablet and/or capsule lubricant; wetting and/or solubilizing agent; vehicle (oleaginous).

Polyoxyl 20 Cetostearyl Ether: Cream-colored, waxy, unctuous mass, melting, when heated, to a clear brownish-yellow liquid. Soluble in water, in alcohol, and in acetone; insoluble in solvent hexane. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polyoxyl 35 Castor Oil: Yellow, oily liquid, having a faint, characteristic odor and a somewhat bitter taste. Very soluble in water, producing a practically odorless and colorless solution; soluble in alcohol and in ethyl acetate; insoluble in mineral oils. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polyoxyl 40 Hydrogenated Castor Oil: White to yellowish paste or pasty liquid, having a faint odor and a slight taste. Very soluble in water, producing a practically tasteless,

odorless, and colorless solution; soluble in alcohol and in ethyl acetate; insoluble in mineral oils. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polyoxyl 40 Stearate: Waxy, white to light tan solid. Is odorless or has a faint, fat-like odor. Soluble in water, in alcohol, in ether, and in acetone; insoluble in mineral oil and in vegetable oils. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polyoxyl Stearate: White or slightly yellowish waxy mass. Soluble in alcohol and in isopropyl alcohol. Polyoxyl stearate corresponding to a product with 6–8 units of ethylene oxide per molecule is soluble in fatty oils and in waxes; practically insoluble in water. Polyoxyl stearate corresponding to a product with 20–100 units of ethylene oxide per molecule is soluble in water; practically insoluble in fatty oils and in waxes. *NF category:* Emulsifying and/or solubilizing agent; wetting and/or solubilizing agent.

Polyoxyl Stearyl Ether: A white to yellowish-white, waxy, unctuous mass, pellets, microbeads, or flakes. Polyoxyl Stearyl Ether with 2 oxyethylene units per molecule is soluble in alcohol, with heating, and in methylene chloride; practically insoluble in water. Polyoxyl Stearyl Ether with 10 oxyethylene units per molecule is soluble in water and in alcohol. Polyoxyl Stearyl Ether with 20 oxyethylene units per molecule is soluble in water, in alcohol, and in methylene chloride. After melting, it solidifies at about 45°.

Polysorbate 20: Lemon to amber liquid having a faint characteristic odor. Soluble in water, in alcohol, in ethyl acetate, in methanol, and in dioxane; insoluble in mineral oil. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polysorbate 40: Yellow liquid having a faint, characteristic odor. Soluble in water and in alcohol; insoluble in mineral oil and in vegetable oils. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polysorbate 60: Lemon- to orange-colored, oily liquid or semi-gel having a faint, characteristic odor. Soluble in water, in ethyl acetate, and in toluene; insoluble in mineral oil and in vegetable oils. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polysorbate 80: Lemon- to amber-colored, oily liquid having a faint, characteristic odor and a warm, somewhat bitter taste. Very soluble in water, producing an odorless and practically colorless solution; soluble in alcohol and in ethyl acetate; insoluble in mineral oil. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Polyvinyl Acetate: White or off-white powder or colorless granules or beads. Freely soluble in ethyl acetate; soluble in alcohol, in acetone, and in chloroform; practically insoluble in water. It is hygroscopic and swells in water. *NF category:* Coating agent; desiccant; tablet binder.

Polyvinyl Acetate Dispersion: Opaque, white or off-white, slightly viscous liquid. Miscible with water and with ethanol. It is sensitive to spoilage by microbial contaminants. *NF category:* Coating agent.

Polyvinyl Acetate Phthalate: Free-flowing white powder. May have a slight odor of acetic acid. Soluble in methanol and in alcohol; insoluble in water, in methylene chloride, and in chloroform. *NF category:* Coating agent.

Polyvinyl Alcohol: White to cream-colored granules, or white to cream-colored powder. Is odorless. Freely soluble in water at room temperature. Solution may be effected more rapidly at somewhat higher temperatures. *NF category:* Suspending and/or viscosity-increasing agent.

Sulfurated Potash: Irregular, liver-brown pieces when freshly made, changing to a greenish yellow. Has an odor of hydrogen sulfide and a bitter, acrid, and alkaline taste, and

decomposes on exposure to air. A solution (1 in 10) is light brown in color and is alkaline to litmus. Freely soluble in water, usually leaving a slight residue. Alcohol dissolves only the sulfides.

Potassium Acetate: Colorless, monoclinic crystals or white, crystalline powder having a saline and slightly alkaline taste. Is odorless, or has a faint acetous odor. Deliquesces on exposure to moist air. Very soluble in water; freely soluble in alcohol.

Potassium Alginate: White to yellow, fibrous or granular powder. Dissolves in water to form a viscous, colloidal solution; insoluble in alcohol and in hydroalcoholic solutions in which the alcohol content is greater than 30% by weight; insoluble in chloroform, in ether, and in acids having a pH lower than about 3.

Potassium Benzoate: White, odorless, or practically odorless, granular or crystalline powder. Is stable in air. Freely soluble in water; soluble in 90% alcohol; sparingly soluble in alcohol. *NF category:* Antimicrobial preservative.

Potassium Bicarbonate: Colorless, transparent, monoclinic prisms or as a white, granular powder. Is odorless, and is stable in air. Its solutions are neutral or alkaline to phenolphthalein TS. Freely soluble in water; practically insoluble in alcohol.

Potassium Bitartrate: Colorless or slightly opaque crystals, or white, crystalline powder. A saturated solution is acid to litmus. Soluble in boiling water; slightly soluble in water; very slightly soluble in alcohol.

Potassium Bromide: White, crystalline powder or colorless, cubical crystals. Freely soluble in water and in glycerol; slightly soluble in alcohol.

Potassium Chloride: Colorless, elongated, prismatic, or cubical crystals, or white, granular powder. Is odorless, has a saline taste, and is stable in air. Its solutions are neutral to litmus. Freely soluble in water; insoluble in alcohol. *NF category:* Tonicity agent.

Potassium Citrate: Transparent crystals or white, granular powder. Is odorless, has a cooling, saline taste, and is deliquescent when exposed to moist air. Freely soluble in water; very slightly soluble in alcohol. *NF category:* Buffering agent.

Potassium Gluconate: White to yellowish-white, crystalline powder or granules. Is odorless, has a slightly bitter taste, and is stable in air. Its solutions are slightly alkaline to litmus. Freely soluble in water; practically insoluble in dehydrated alcohol, in ether, in benzene, and in chloroform.

Potassium Hydroxide: White or practically white, fused masses, or small pellets, or flakes, or sticks, or other forms. Is hard and brittle and shows a crystalline fracture. Exposed to air, it rapidly absorbs carbon dioxide and moisture, and deliquesces. Very soluble in boiling alcohol; freely soluble in water, in alcohol, and in glycerin. *NF category:* Alkalizing agent.

Potassium Iodide: Hexahedral crystals, either transparent and colorless or somewhat opaque and white, or a white, granular powder. Is slightly hygroscopic. Its solutions are neutral or alkaline to litmus. Very soluble in water and even more soluble in boiling water; freely soluble in glycerin; soluble in alcohol.

Potassium Iodide Oral Solution: Clear, colorless, odorless liquid, having a characteristic, strongly salty taste. Is neutral or alkaline to litmus. Specific gravity is about 1.70.

Potassium Metabisulfite: White or colorless, free-flowing crystals, crystalline powder, or granules, usually having an odor of sulfur dioxide. Gradually oxidizes in air to the sulfate. Its solutions are acid to litmus. Soluble in water; insoluble in alcohol. *NF category:* Antioxidant.

Potassium Metaphosphate: White, odorless powder. Soluble in dilute solutions of sodium salts; insoluble in water. *NF category:* Buffering agent.

Potassium Nitrate: White, crystalline powder or colorless crystals. Very soluble in boiling water; freely soluble in water; soluble in glycerin; practically insoluble in alcohol.

Potassium Permanganate: Dark purple crystals, almost opaque by transmitted light and of a blue metallic luster by reflected light. Its color is sometimes modified by a dark bronze-like appearance. Is stable in air. Freely soluble in boiling water; soluble in water.

Dibasic Potassium Phosphate: Colorless or white, somewhat hygroscopic, granular powder. The pH of a solution (1 in 20) is about 8.5 to 9.6. Freely soluble in water; very slightly soluble in alcohol. *NF category:* Buffering agent.

Monobasic Potassium Phosphate: Colorless crystals or white, granular or crystalline powder. Is odorless, and is stable in air. The pH of a solution (1 in 100) is about 4.5. Freely soluble in water; practically insoluble in alcohol. *NF category:* Buffering agent.

Potassium Sodium Tartrate: Colorless crystals or white, crystalline powder, having a cooling, saline taste. As it effloresces slightly in warm, dry air, the crystals are often coated with a white powder. Freely soluble in water; practically insoluble in alcohol.

Potassium Sorbate: White crystals or powder, having a characteristic odor. Melts at about 270°, with decomposition. Freely soluble in water; soluble in alcohol. *NF category:* Antimicrobial preservative.

Povidone: White to slightly creamy white powder. Is hygroscopic. Freely soluble in water, in methanol, and in alcohol; slightly soluble in acetone; practically insoluble in ether. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder.

Povidone-Iodine: Yellowish-brown to reddish-brown, amorphous powder, having a slight, characteristic odor. Its solution is acid to litmus. Soluble in water and in alcohol; practically insoluble in chloroform, in carbon tetrachloride, in ether, in solvent hexane, and in acetone.

Povidone-Iodine Topical Aerosol Solution: The liquid obtained from Povidone-Iodine Topical Aerosol Solution is transparent, having a reddish brown color.

Pralidoxime Chloride: White to pale-yellow, crystalline powder. Is odorless and is stable in air. Freely soluble in water.

Pramipexole Dihydrochloride: White to almost white crystalline powder. Freely soluble in water; soluble in methanol; slightly soluble in alcohol; practically insoluble in methylene chloride.

Pramoxine Hydrochloride: White to practically white, crystalline powder, having a numbing taste. May have a slight aromatic odor. The pH of a solution (1 in 100) is about 4.5. Freely soluble in water and in alcohol; soluble in chloroform; very slightly soluble in ether.

Pravastatin Sodium: White to yellowish white, hygroscopic powder. Freely soluble in water and in methanol; soluble in dehydrated alcohol; practically insoluble in acetonitrile and in chloroform.

Praziquantel: White or practically white, crystalline powder; odorless or having a faint characteristic odor. Freely soluble in alcohol and in chloroform; very slightly soluble in water.

Prazosin Hydrochloride: White to tan powder. Slightly soluble in water, in methanol, in dimethylformamide, and in dimethylacetamide; very slightly soluble in alcohol; practically insoluble in chloroform and in acetone.

Prednicarbate: White to almost white, crystalline powder. Freely soluble in acetone and in alcohol; sparingly soluble in propylene glycol; practically insoluble in water.

Prednisolone: White to practically white, odorless, crystalline powder. Melts at about 235°, with some decomposition (see *Melting Range or Temperature* (741)). Soluble in methanol and in dioxane; sparingly soluble in acetone and

in alcohol; slightly soluble in chloroform; very slightly soluble in water.

Prednisolone Acetate: White to practically white, odorless, crystalline powder. Melts at about 235°, with some decomposition (see *Melting Range or Temperature* (741)). Slightly soluble in acetone, in alcohol, and in chloroform; practically insoluble in water.

Prednisolone Hemisuccinate: Fine, creamy white powder with friable lumps; practically odorless. Melts at about 205°, with decomposition. Freely soluble in alcohol; soluble in acetone; very slightly soluble in water.

Prednisolone Sodium Phosphate: White or slightly yellow, friable granules or powder. Is odorless or has a slight odor. Is slightly hygroscopic. Freely soluble in water; soluble in methanol; slightly soluble in alcohol and in chloroform; very slightly soluble in acetone and in dioxane.

Prednisolone Sodium Succinate for Injection: Creamy white powder with friable lumps, having a slight odor.

Prednisolone Tebutate: White to slightly yellow, free-flowing powder, which may show some soft lumps. Is odorless or has not more than a moderate, characteristic odor. Is hygroscopic. Freely soluble in chloroform and in dioxane; soluble in acetone; sparingly soluble in alcohol and in methanol; very slightly soluble in water.

Prednisone: White to practically white, odorless, crystalline powder. Melts at about 230°, with some decomposition (see *Melting Range or Temperature* (741)). Slightly soluble in alcohol, in chloroform, in dioxane, and in methanol; very slightly soluble in water.

Prilocaine: White or almost white powder or crystal aggregates. Very soluble in alcohol and in acetone; slightly soluble in water.

Prilocaine Hydrochloride: White, odorless, crystalline powder, having a bitter taste. Freely soluble in water and in alcohol; slightly soluble in chloroform; very slightly soluble in acetone; practically insoluble in ether.

Primaquine Phosphate: Orange-red, crystalline powder. Is odorless and has a bitter taste. Its solutions are acid to litmus. Melts at about 200°. Soluble in water; insoluble in chloroform and in ether.

Primidone: White, crystalline powder. Is odorless and has a slightly bitter taste. Slightly soluble in alcohol; very slightly soluble in water and in most organic solvents.

Probucol: White to off-white, crystalline powder. Freely soluble in chloroform and in *n*-propyl alcohol; soluble in alcohol and in solvent hexane; insoluble in water.

Probenecid: White or practically white, fine, crystalline powder. Is practically odorless. Soluble in dilute alkali, in chloroform, in alcohol, and in acetone; practically insoluble in water and in dilute acids.

Procainamide Hydrochloride: White to tan, crystalline powder. Is odorless. Its solution (1 in 10) has a pH between 5 and 6.5. Very soluble in water; soluble in alcohol; slightly soluble in chloroform; very slightly soluble in benzene and in ether.

Procainamide Hydrochloride Injection: Colorless, or having not more than a slight yellow color.

Procaine Hydrochloride: Small, white crystals or white, crystalline powder. Is odorless. Exhibits local anesthetic properties when placed on the tongue. Freely soluble in water; soluble in alcohol; slightly soluble in chloroform; practically insoluble in ether.

Procaine Hydrochloride Injection: Clear, colorless liquid.

Prochlorperazine: Clear, pale yellow, viscous liquid. Is sensitive to light. Freely soluble in alcohol, in chloroform, and in ether; very slightly soluble in water.

Prochlorperazine Edisylate: White to very light yellow, odorless, crystalline powder. Its solutions are acid to litmus. Freely soluble in water; very slightly soluble in alcohol; insoluble in ether and in chloroform.

Prochlorperazine Maleate: White or pale yellow, practically odorless, crystalline powder. Its saturated solution is acid to litmus. Slightly soluble in warm chloroform; practically insoluble in water and in alcohol.

Procyclidine Hydrochloride: White, crystalline powder, having a moderate, characteristic odor. Melts at about 225°, with decomposition. Soluble in water and in alcohol; insoluble in ether and in acetone.

Progesterone: White or creamy white, odorless, crystalline powder. Is stable in air. Soluble in alcohol, in acetone, and in dioxane; sparingly soluble in vegetable oils; practically insoluble in water.

Proguanil Hydrochloride: White, crystalline powder. Sparingly soluble in alcohol; slightly soluble in water; practically insoluble in methylene chloride.

Proline: White, odorless crystals, having a slightly sweet taste. Freely soluble in water and in absolute alcohol; insoluble in ether, in butanol, and in isopropanol.

Promazine Hydrochloride: White to slightly yellow, practically odorless, crystalline powder. It oxidizes upon prolonged exposure to air and acquires a blue or pink color. Freely soluble in water and in chloroform.

Promethazine Hydrochloride: White to faint yellow, practically odorless, crystalline powder. Slowly oxidizes, and acquires a blue color, on prolonged exposure to air. Freely soluble in water, in hot dehydrated alcohol, and in chloroform; practically insoluble in ether, in acetone, and in ethyl acetate.

Propafenone Hydrochloride: White powder. Soluble in methanol and in hot water; slightly soluble in alcohol and in chloroform; very slightly soluble in acetone; insoluble in diethyl ether and in toluene.

Propane: Colorless, flammable gas (boiling temperature is about -42°). One hundred volumes of water dissolves 6.5 volumes at 17.8° and 753 mm pressure; 100 volumes of anhydrous alcohol dissolves 790 volumes at 16.6° and 754 mm pressure; 100 volumes of ether dissolves 926 volumes at 16.6° and 757 mm pressure; 100 volumes of chloroform dissolves 1299 volumes at 21.6° and 757 mm pressure. Vapor pressure at 21° is about 10290 mm of mercury (108 psig). *NF category:* Aerosol propellant.

Propantheline Bromide: White or practically white crystals. Is odorless and has a bitter taste. Melts at about 160°, with decomposition. Very soluble in water, in alcohol, and in chloroform; practically insoluble in ether and in benzene.

Proparacaine Hydrochloride: White to off-white, or faintly buff-colored, odorless, crystalline powder. Its solutions are neutral to litmus. Soluble in water, in warm alcohol, and in methanol; insoluble in ether and in benzene.

Proparacaine Hydrochloride Ophthalmic Solution: Colorless or faint yellow solution.

Propionic Acid: Oily liquid having a slight pungent, rancid odor. Miscible with water and with alcohol and various other organic solvents. *NF category:* Acidifying agent.

Propofol: Clear, colorless to slightly yellowish liquid. Very soluble in methanol and in ethanol; slightly soluble in cyclohexane and in isopropyl alcohol; very slightly soluble in water.

Propoxycaïne Hydrochloride: White, odorless, crystalline solid, which discolors on prolonged exposure to light and air. The pH of a solution (1 in 50) is about 5.4. Freely soluble in water; soluble in alcohol; sparingly soluble in ether; practically insoluble in acetone and in chloroform.

Propoxyphene Hydrochloride: White, crystalline powder. Is odorless, and has a bitter taste. Freely soluble in water; soluble in alcohol, in chloroform, and in acetone; practically insoluble in benzene and in ether.

Propoxyphene Napsylate: White powder, having essentially no odor, but having a bitter taste. Soluble in meth-

anol, in alcohol, in chloroform, and in acetone; very slightly soluble in water.

Propranolol Hydrochloride: White to off-white, crystalline powder. Is odorless and has a bitter taste. Melts at about 164°. Soluble in water and in alcohol; slightly soluble in chloroform; practically insoluble in ether.

Propyl Gallate: White, crystalline powder having a very slight, characteristic odor. Freely soluble in alcohol; slightly soluble in water. *NF category:* Antioxidant.

Propylene Glycol: Clear, colorless, viscous liquid having a slight, characteristic taste. Is practically odorless. Absorbs moisture when exposed to moist air. Miscible with water, with acetone, and with chloroform. Soluble in ether and will dissolve many essential oils, but is immiscible with fixed oils. *NF category:* Humectant; plasticizer; solvent.

Propylene Glycol Alginate: White to yellowish fibrous or granular powder. Practically odorless and tasteless. Soluble in water, in solutions of dilute organic acids, and, depending on the degree of esterification, in hydroalcoholic mixture containing up to 60% by weight of alcohol to form stable, viscous colloidal solutions at a pH of 3. *NF category:* Suspending and/or viscosity-increasing agent.

Propylene Glycol Dicaprylate/Dicaprate: Clear, colorless or slightly yellow oily liquid at 20°. Soluble in fatty oils and in light petroleum; slightly soluble in dehydrated alcohol; practically insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; vehicle.

Propylene Glycol Dilaurate: Clear, oily liquid at 20°. Colorless or slightly yellow. Very soluble in alcohol, in methanol, and in methylene chloride; practically insoluble in water.

Propylene Glycol Monocaprylate: Clear, colorless, or slightly yellow, oily liquid at 20°. Very soluble in alcohol, in chloroform, and in methylene chloride; practically insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule diluent; vehicle.

Propylene Glycol Monolaurate: Clear, oily liquid at 20°. Colorless or slightly yellow. Very soluble in alcohol, in methanol, and in methylene chloride; practically insoluble in water.

Propylene Glycol Monostearate: White, wax-like solid or as white, wax-like beads or flakes. Has a slight, agreeable, fatty odor and taste. Soluble in organic solvents such as alcohol, mineral or fixed oils, benzene, ether, and acetone; insoluble in water, but may be dispersed in hot water with the aid of a small amount of soap or other suitable surface-active agent. *NF category:* Emulsifying and/or solubilizing agent.

Propylhexedrine: Clear, colorless liquid, having a characteristic, amine-like odor. Volatilizes slowly at room temperature. Absorbs carbon dioxide from the air, and its solutions are alkaline to litmus. Boils at about 205°. Very slightly soluble in water. Miscible with alcohol, with chloroform, and with ether.

Propylidone: White or almost white, crystalline powder. Is odorless or has a faint odor. Soluble in acetone, in alcohol, and in ether; practically insoluble in water.

Propylparaben: Small, colorless crystals or white powder. Freely soluble in alcohol and in ether; slightly soluble in boiling water; very slightly soluble in water. *NF category:* Antimicrobial preservative.

Propylparaben Sodium: White powder. Is odorless and hygroscopic. Freely soluble in water; sparingly soluble in alcohol; insoluble in fixed oils. *NF category:* Antimicrobial preservative.

Propylthiouracil: White, powdery, crystalline substance. Is starch-like in appearance and to the touch, and has a bitter taste. Soluble in ammonium hydroxide and in alkali hydroxides; sparingly soluble in alcohol; slightly soluble in water, in chloroform, and in ether.

Protamine Sulfate Injection: Colorless solution, which may have the odor of a preservative.

Protamine Sulfate for Injection: White, odorless powder, having the characteristic appearance of solids dried from the frozen state.

Protein Hydrolysate Injection: Yellowish to reddish-amber, transparent liquid.

Protriptyline Hydrochloride: White to yellowish powder. Is odorless, or has not more than a slight odor. Melts at about 168°. Freely soluble in water, in alcohol, and in chloroform; practically insoluble in ether.

Pseudoephedrine Hydrochloride: Fine, white to off-white crystals or powder, having a faint characteristic odor. Very soluble in water; freely soluble in alcohol; slightly soluble in chloroform.

Pseudoephedrine Sulfate: White crystals or crystalline powder. Is odorless. Freely soluble in alcohol.

Pullulan: White powder. Freely soluble in water; practically insoluble in dehydrated alcohol. *NF category:* Bulking agent for freeze-drying; coating agent; plasticizer; polymer membrane; sequestering agent; suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant; wetting and/or solubilizing agent.

Pumice: Very light, hard, rough, porous, grayish masses or gritty, grayish powder. Is odorless and tasteless, and is stable in air. Practically insoluble in water; is not attacked by acids.

Pyrantel Pamoate: Yellow to tan solid. Soluble in dimethyl sulfoxide; slightly soluble in dimethylformamide; practically insoluble in water and in methanol.

Pyrazinamide: White to practically white, odorless or practically odorless, crystalline powder. Sparingly soluble in water; slightly soluble in alcohol, in ether, and in chloroform.

Pyrethrum Extract: Pale yellow liquid having a bland, flowery odor. Soluble in mineral oil and in most organic solvents; insoluble in water. *Pyrethrins I* denotes the group containing pyrethrin 1, cinerin 1, and jasmolin 1; *Pyrethrins II* denotes the group containing pyrethrin 2, cinerin 2, and jasmolin 2.

Pyridostigmine Bromide: White or practically white, crystalline powder, having an agreeable, characteristic odor. Is hygroscopic. Freely soluble in water, in alcohol, and in chloroform; slightly soluble in solvent hexane; practically insoluble in ether.

Pyridoxine Hydrochloride: White to practically white crystals or crystalline powder. Is stable in air, and is slowly affected by sunlight. Its solutions have a pH of about 3. Freely soluble in water; slightly soluble in alcohol; insoluble in ether.

Pyrilamine Maleate: White, crystalline powder, usually having a faint odor. Its solutions are acid to litmus. Very soluble in water; freely soluble in alcohol and in chloroform; slightly soluble in ether and in benzene.

Pyrimethamine: White, odorless, crystalline powder. Slightly soluble in acetone, in alcohol, and in chloroform; practically insoluble in water.

Pyrvinium Pamoate: Bright orange or orange-red to practically black, crystalline powder. Freely soluble in glacial acetic acid; slightly soluble in chloroform and in methoxyethanol; very slightly soluble in methanol; practically insoluble in water and in ether.

Pyrvinium Pamoate Oral Suspension: Dark red, opaque suspension of essentially very fine, amorphous particles or aggregates, usually less than 10 µm in size. Larger particles, some of which may be crystals, up to 100 µm in size also may be present.

Quazepam: Off-white to yellowish powder.

Quinapril Hydrochloride: White to off-white powder, with a pink cast at times. Freely soluble in aqueous solvents.

Quinidine Gluconate: White powder. Is odorless and has a very bitter taste. Freely soluble in water; slightly soluble in alcohol.

Quinidine Sulfate: Fine, needle-like, white crystals, frequently cohering in masses, or fine, white powder. Is odorless, and darkens on exposure to light. Its solutions are neutral or alkaline to litmus. Soluble in alcohol; sparingly soluble in chloroform; slightly soluble in water; insoluble in ether.

Quinine Sulfate: White, fine, needle-like crystals, usually lusterless, making a light and readily compressible mass. Is odorless. It darkens on exposure to light. Its saturated solution is neutral or alkaline to litmus. Freely soluble in alcohol at 80°, and in a mixture of 2 volumes of chloroform and 1 volume of dehydrated alcohol; sparingly soluble in water at 100°; slightly soluble in water, in alcohol, and in chloroform; very slightly soluble in ether.

Rabies Immune Globulin: Transparent or slightly opalescent liquid, practically colorless and practically odorless. May develop a slight, granular deposit during storage.

Rabies Vaccine: White to straw-colored, amorphous pellet, which may or may not become fragmented when shaken.

Racemethionine: Almost white, crystalline powder or small flakes. Sparingly soluble in water; very slightly soluble in alcohol. It dissolves in dilute acids and in dilute solutions of alkali hydroxides. It melts at about 270°. *NF category:* Antioxidant; buffering agent; flavors and perfumes.

Racpinephrine: White to nearly white, crystalline, odorless powder, gradually darkening on exposure to light and air. With acids, it forms salts that are readily soluble in water, and the base may be recovered by the addition of ammonium hydroxide. Very slightly soluble in water and in alcohol; insoluble in ether, in chloroform, and in fixed and volatile oils.

Racpinephrine Hydrochloride: Fine, white, odorless powder. Darkens on exposure to light and air. Its solutions are acid to litmus. Melts at about 157°. Freely soluble in water; sparingly soluble in alcohol.

Raloxifene Hydrochloride: Almost white to pale yellow powder. Freely soluble in dimethylsulfoxide; sparingly soluble in methanol; slightly soluble in alcohol; very slightly soluble in water, in isopropyl alcohol, and in octanol; practically insoluble in ether and in ethyl acetate.

Ramipril: White to almost white crystalline powder. Freely soluble in methanol; sparingly soluble in water.

Ranitidine Hydrochloride: White to pale yellow, crystalline, practically odorless powder. Is sensitive to light and moisture. Melts at about 140°, with decomposition. Very soluble in water; sparingly soluble in alcohol.

Fully Hydrogenated Rapeseed Oil: White, waxy solid. Insoluble in water and in alcohol. *NF category:* Coating agent; stiffening agent.

Superglycerinated Fully Hydrogenated Rapeseed Oil: White solid. Insoluble in water and in alcohol. *NF category:* Coating agent; emulsifying and/or solubilizing agent; stiffening agent.

Purified Rayon: White, lustrous or dull, fine, soft, filamentous fibers, appearing under the microscope as round, oval, or slightly flattened translucent rods, straight or crimped, striate and with serrate cross-sectional edges. Is practically odorless and practically tasteless. Very soluble in ammoniated cupric oxide TS and in dilute sulfuric acid (3 in 5); insoluble in ordinary solvents.

Repaglinide: White to off-white solid. Melts at about 132° to 136°. Soluble in methanol.

Reserpine: White or pale buff to slightly yellowish, odorless, crystalline powder. Darkens slowly on exposure to light, but more rapidly when in solution. Freely soluble in acetic acid and in chloroform; slightly soluble in benzene;

very slightly soluble in alcohol and in ether; insoluble in water.

Resorcinol: White, or practically white, needle-shaped crystals or powder. Has a faint, characteristic odor and a sweetish, followed by a bitter, taste. Acquires a pink tint on exposure to light and air. Its solution (1 in 20) is neutral or acid to litmus. Freely soluble in water, in alcohol, in glycerin, and in ether; slightly soluble in chloroform.

Ribavirin: White, crystalline powder. Freely soluble in water; slightly soluble in dehydrated alcohol.

Riboflavin: Yellow to orange-yellow, crystalline powder having a slight odor. Melts at about 280°. Its saturated solution is neutral to litmus. When dry, it is not appreciably affected by diffused light, but when in solution, light induces quite rapid deterioration, especially in the presence of alkalies. Soluble in dilute solutions of alkalies; very slightly soluble in water, in alcohol, and in isotonic sodium chloride solution; insoluble in ether and in chloroform.

Riboflavin 5'-Phosphate Sodium: Fine, orange-yellow, crystalline powder, having a slight odor. Sparingly soluble in water. When dry, it is not affected by diffused light, but when in solution, light induces deterioration rapidly. Is hygroscopic.

Rifabutin: Amorphous red-violet powder. Soluble in chloroform and in methanol; sparingly soluble in alcohol; very slightly soluble in water.

Rifampin: Red-brown, crystalline powder. Freely soluble in chloroform; soluble in ethyl acetate and in methanol; very slightly soluble in water.

Riluzole: White to slightly yellow powder or crystalline powder. Freely soluble in acetonitrile, in alcohol, and in methylene chloride; slightly soluble in hexane; very slightly soluble in water.

Rimexolone: White to off-white powder. Freely soluble in chloroform; sparingly soluble in methanol.

Risedronate Sodium: White to off-white powder. Soluble in water and in aqueous solutions; insoluble in common organic solvents.

Risperidone: White or almost white powder. Soluble in methylene chloride; sparingly soluble in alcohol; practically insoluble in water.

Ritodrine Hydrochloride: White to nearly white, odorless or practically odorless, crystalline powder. Melts at about 200°. Freely soluble in water and in alcohol; soluble in *n*-propyl alcohol; practically insoluble in ether.

Ritonavir: White to light tan powder. Freely soluble in methanol and in methylene chloride; very slightly soluble in acetonitrile; practically insoluble in water.

Rivastigmine Tartrate: White to off-white powder. Very soluble in water and in methanol; very slightly soluble in ethyl acetate.

Rizatriptan Benzoate: White to almost white crystalline powder. Soluble in water; sparingly soluble in alcohol; slightly soluble in methylene chloride.

Rocuronium Bromide: Almost white or pale yellow. Slightly hygroscopic powder. Freely soluble in water and in dehydrated alcohol.

Ropinirole Hydrochloride: Pale cream to yellow powder. Soluble in water.

Ropivacaine Hydrochloride: White, crystalline powder. Soluble in water.

Rose Oil: Colorless or yellow liquid, having the characteristic odor and taste of rose. At 25° is a viscous liquid. Upon gradual cooling, changes to a translucent, crystalline mass, easily liquefied by warming. *NF category:* Flavors and perfumes.

Rose Water Ointment: *NF category:* Ointment base.

Stronger Rose Water: Practically colorless and clear, having the pleasant odor and taste of fresh rose blossoms. Is

free from empyreuma, mustiness, and fungal growths. *NF category:* Flavors and perfumes.

Change to read:

Rosiglitazone Maleate: White to off-white solid.
 ▲ USP36 Sparingly soluble in alcohol; slightly soluble in methylene chloride; practically insoluble to very slightly soluble in water.

Roxarsone: Pale yellow, crystalline powder. Freely soluble in acetic acid, in acetone, in alkalis, in methanol, and in dehydrated alcohol; soluble in boiling water; sparingly soluble in dilute mineral acids; slightly soluble in cold water; insoluble in ether and in ethyl acetate. Puffs up and deflates on heating.

Rubella Virus Vaccine Live: Solid having the characteristic appearance of substances dried from the frozen state. Undergoes loss of potency on exposure to sunlight. The Vaccine is to be constituted with a suitable diluent just prior to use.

Add the following:

▲ **Rufinamide:** White, crystalline neutral powder. Slightly soluble in tetrahydrofuran and in methanol; very slightly soluble in alcohol and in acetonitrile; practically insoluble in water. ▲ USP36

Saccharin: White crystals or white, crystalline powder. Is odorless or has a faint, aromatic odor. In dilute solution, it is intensely sweet. Its solutions are acid to litmus. Soluble in boiling water; sparingly soluble in alcohol; slightly soluble in water, in chloroform, and in ether. Is readily dissolved by dilute solutions of ammonia, by solutions of alkali hydroxides, and by solutions of alkali carbonates with the evolution of carbon dioxide. *NF category:* Sweetening agent.

Saccharin Calcium: White crystals or white, crystalline powder. Is odorless, or has a faint, aromatic odor, and has an intensely sweet taste even in dilute solutions. Its dilute solution is about 300 times as sweet as sucrose. Freely soluble in water. *NF category:* Sweetening agent.

Saccharin Sodium: White crystals or white, crystalline powder. Is odorless, or has a faint, aromatic odor, and has an intensely sweet taste even in dilute solutions. Its dilute solution is about 300 times as sweet as sucrose. When in powdered form, it usually contains about one-third the theoretical amount of water of hydration as a result of efflorescence. Freely soluble in water; sparingly soluble in alcohol. *NF category:* Sweetening agent.

Saccharin Sodium Oral Solution: Clear, colorless, odorless liquid, having a sweet taste.

Safflower Oil: Light yellow oil. Thickens and becomes rancid on prolonged exposure to air. Insoluble in water. Miscible with ether and with chloroform. *NF category:* Vehicle (oleaginous).

Salicylamide: White, practically odorless, crystalline powder. Freely soluble in ether and in solutions of alkalis; soluble in alcohol and in propylene glycol; slightly soluble in water and in chloroform.

Salicylic Acid: White crystals, usually in fine needles, or fluffy, white, crystalline powder. Has a sweetish, followed by an acid, taste and is stable in air. The synthetic form is white and odorless. When prepared from natural methyl salicylate, it may have a slightly yellow or pink tint, and a faint, mint-like odor. Freely soluble in alcohol and in ether; soluble in boiling water; sparingly soluble in chloroform; slightly soluble in water and in benzene.

Salmeterol Xinafoate: White to off-white powder. Soluble in methanol; slightly soluble in alcohol, in isopropanol, and in chloroform; practically insoluble in water (pH 8), and in saline solution (0.9% w/w).

Scopolamine Hydrobromide: Colorless or white crystals or white, granular powder. Melts at about 197°, with decomposition. Is odorless, and slightly efflorescent in dry air. Freely soluble in water; soluble in alcohol; slightly soluble in chloroform; insoluble in ether.

Secobarbital: White, amorphous or crystalline, odorless powder, having a slightly bitter taste. Its saturated solution has a pH of about 5.6. Freely soluble in alcohol, in ether, and in solutions of fixed alkali hydroxides and carbonates; soluble in chloroform; very slightly soluble in water.

Secobarbital Sodium: White powder. Is odorless, has a bitter taste, and is hygroscopic. Its solutions decompose on standing, heat accelerating the decomposition. Very soluble in water; soluble in alcohol; practically insoluble in ether.

Selegiline Hydrochloride: White, odorless, crystalline powder. Freely soluble in water, in chloroform, and in methanol.

Selenium Sulfide: Reddish-brown to bright orange powder, having not more than a faint odor. Practically insoluble in water and in organic solvents.

Sennosides: Brownish powder.

Serine: White, odorless crystals, having a sweet taste. Soluble in water; practically insoluble in absolute alcohol and in ether.

Sertraline Hydrochloride: White or off-white crystalline powder. Sparingly soluble in absolute alcohol; slightly soluble in water, in acetone, and in isopropanol.

Sesame Oil: Pale yellow, oily liquid. Is practically odorless, and has a bland taste. Slightly soluble in alcohol. Miscible with ether, with chloroform, with solvent hexane, and with carbon disulfide. *NF category:* Solvent, vehicle (oleaginous).

Sevoflurane: Clear, colorless, volatile, nonflammable liquid. Slightly soluble in water. Miscible with alcohol, with chloroform, and with ether.

Shellac: *Orange Shellac*—Thin, hard, brittle, transparent, pale lemon-yellow to brownish orange flakes, having little or no odor; *Bleached Shellac*—Opaque, amorphous cream to yellow granules or coarse powder, having little or no odor. Soluble (very slowly) in alcohol, 85% to 95% (w/w), in ether, 13% to 15%, in benzene, 10% to 20%, in petroleum ether, 2% to 6%; soluble in aqueous solutions of ethanalamines, alkalis, and borax; sparingly soluble in oil of turpentine; insoluble in water. *NF category:* Coating agent.

Sibutramine Hydrochloride Monohydrate: White to cream crystalline powder. Slightly soluble in pH 5.2 water.

Sildenafil Citrate: White or almost white slightly hygroscopic crystalline powder. Slightly soluble in water and in methanol; practically insoluble in hexane.

Dental-Type Silica: Fine, white, hygroscopic, odorless, amorphous powder, in which the diameter of the average particles ranges between 0.5 and 40 µm. Soluble in hot solutions of alkali hydroxides; insoluble in water, in alcohol, and in acid (except hydrofluoric acid). *NF category:* Glidant and/or anticaking agent; suspending and/or viscosity-increasing agent.

Hydrophobic Colloidal Silica: Light, fine, white or almost white, amorphous powder, not wettable by water. Disolves slowly in hot solutions of alkali hydroxides. Practically insoluble in water and in mineral acids, except hydrofluoric acid. *NF category:* Glidant and/or anticaking agent; suspending and/or viscosity-increasing agent.

Purified Siliceous Earth: Very fine, white, light gray, or pale buff mixture of amorphous powder and lesser amounts of crystalline polymorphs, including quartz and cristobalite. Is gritty, readily absorbs moisture, and retains about four times its weight of water without becoming fluid. Insoluble in water, in acids, and in dilute solutions of the alkali hydroxides. *NF category:* Filtering aid; sorbent.

Silicon Dioxide: Fine, white, hygroscopic, odorless, amorphous powder, in which the diameter of the average

particles ranges between 2 and 10 μm . Soluble in hot solutions of alkali hydroxides; insoluble in water, in alcohol, and in other organic solvents. *NF category*: Desiccant; suspending and/or viscosity-increasing agent.

Colloidal Silicon Dioxide: Light, white, nongritty powder of extremely fine particle size (about 15 nm). Soluble in hot solutions of alkali hydroxides; insoluble in water and in acid (except hydrofluoric). *NF category*: Glidant and/or anti-caking agent; suspending and/or viscosity-increasing agent.

Silver Nitrate: Colorless or white crystals. The pH of its solutions is about 5.5. On exposure to light in the presence of organic matter, it becomes gray or grayish black. Very soluble in water and even more so in boiling water; freely soluble in boiling alcohol; sparingly soluble in alcohol; slightly soluble in ether.

Toughened Silver Nitrate: White, crystalline masses generally molded as pencils or cones. It breaks with a fibrous fracture. Its solutions are neutral to litmus. It becomes gray or grayish black upon exposure to light. Soluble in water to the extent of its nitrate content (there is always a residue of silver chloride); partially soluble in alcohol; slightly soluble in ether.

Simethicone: Translucent, gray, viscous fluid. The liquid phase is soluble in chloroform, in ether, and in benzene, but silicon dioxide remains as a residue in these solvents. Insoluble in water and in alcohol. *NF category*: Antifoaming agent; water repelling agent.

Simvastatin: White to off-white powder. Freely soluble in chloroform, in methanol, and in alcohol; sparingly soluble in propylene glycol; very slightly soluble in hexane; practically insoluble in water.

Smallpox Vaccine: Liquid Vaccine is a turbid, whitish to greenish suspension, which may have a slight odor due to the antimicrobial agent. Dried Vaccine is a yellow to grayish pellet, which may or may not become fragmented when shaken.

Soda Lime: White or grayish-white granules. May have a color if an indicator has been added. *NF category*: Sorbent, carbon dioxide.

Sodium Acetate: Colorless, transparent crystals, or white, granular crystalline powder, or white flakes. Is odorless or has a faint acetous odor, and has a slightly bitter, saline taste. Is efflorescent in warm, dry air. Very soluble in water; soluble in alcohol. *NF category*: Buffering agent.

Sodium Alginate: Practically odorless and tasteless, coarse or fine powder, yellowish white in color. Soluble in water, forming a viscous, colloidal solution; insoluble in alcohol and in hydroalcoholic solutions in which the alcohol content is greater than about 30% by weight, in chloroform, in ether, and in acids when the pH of the resulting solution becomes lower than about 3. *NF category*: Suspending and/or viscosity-increasing agent.

Sodium Ascorbate: White or very faintly yellow crystals or crystalline powder. Is odorless or practically odorless. Is relatively stable in air. On exposure to light it gradually darkens. Freely soluble in water; very slightly soluble in alcohol; insoluble in chloroform and in ether.

Sodium Benzoate: White, odorless or practically odorless, granular or crystalline powder. Is stable in air. Freely soluble in water; soluble in 90% alcohol; sparingly soluble in alcohol. *NF category*: Antimicrobial preservative.

Sodium Bicarbonate: White, crystalline powder. Is stable in dry air, but slowly decomposes in moist air. Its solutions, when freshly prepared with cold water, without shaking, are alkaline to litmus. The alkalinity increases as the solutions stand, as they are agitated, or as they are heated. Soluble in water; insoluble in alcohol. *NF category*: Alkalizing agent.

Sodium Bisulfite: White, crystalline powder. Freely soluble in cold water and in hot water; sparingly soluble in alcohol. *NF category*: Antioxidant.

Sodium Borate: Colorless, transparent crystals or white, crystalline powder. Is odorless. Its solutions are alkaline to phenolphthalein TS. As it effloresces in warm, dry air, the crystals are often coated with white powder. Freely soluble in boiling water and in glycerin; soluble in water; insoluble in alcohol. *NF category*: Alkalizing agent.

Sodium Bromide: White, crystalline powder or colorless, cubical crystals. Freely soluble in water; soluble in alcohol.

Sodium Butyrate: Clear, colorless, hygroscopic powder. Soluble in water and in methanol. Melting range is about 250° to 253°.

Sodium Caprylate: A white, crystalline powder. Very soluble or freely soluble in water; freely soluble in acetic acid; sparingly soluble in alcohol; practically insoluble in acetone.

Sodium Carbonate: Colorless crystals, or white, crystalline powder or granules. Is stable in air under ordinary conditions. When exposed to dry air above 50°, the hydrous salt effloresces and, at 100°, becomes anhydrous. Very soluble in boiling water; freely soluble in water. *NF category*: Alkalizing agent.

Sodium Cetostearyl Sulfate: A white or pale yellow, amorphous or crystalline powder. Soluble in hot water giving an opalescent solution; slightly soluble in alcohol; practically insoluble in cold water.

Sodium Chloride: Colorless, cubic crystals or white crystalline powder. Has a saline taste. Freely soluble in water; soluble in glycerin; slightly soluble in alcohol. *NF category*: Tonicity agent.

Sodium Chloride Inhalation Solution: Clear, colorless solution.

Bacteriostatic Sodium Chloride Injection: Clear, colorless solution, odorless or having the odor of the bacteriostatic substance. *NF category*: Vehicle (sterile).

Sodium Chloride Irrigation: Clear, colorless solution.

Sodium Citrate: Colorless crystals, or white, crystalline powder. Hydrous form very soluble in boiling water; freely soluble in water; insoluble in alcohol. *NF category*: Buffering agent.

Sodium Citrate and Citric Acid Oral Solution: Clear solution having the color of any added preservative or flavoring agents.

Sodium Dehydroacetate: White or practically white, odorless powder, having a slight characteristic taste. Freely soluble in water, in propylene glycol, and in glycerin. *NF category*: Antimicrobial preservative.

Sodium Fluoride: White, odorless powder. Soluble in water; insoluble in alcohol.

Sodium Formaldehyde Sulfoxylate: White crystals or hard, white masses, having the characteristic odor of garlic. Freely soluble in water; slightly soluble in alcohol, in ether, in chloroform, and in benzene. *NF category*: Antioxidant.

Sodium Hydroxide: White, or practically white, fused masses, in small pellets, in flakes, or sticks, and in other forms. Is hard and brittle and shows a crystalline fracture. Exposed to the air, it rapidly absorbs carbon dioxide and moisture. Freely soluble in water and in alcohol. *NF category*: Alkalizing agent.

Sodium Hypochlorite Solution: Clear, pale greenish-yellow liquid, having the odor of chlorine. Is affected by light.

Sodium Iodide: Colorless, odorless crystals, or white, crystalline powder. Is deliquescent in moist air, and develops a brown tint upon decomposition. Very soluble in water; freely soluble in alcohol and in glycerin.

Sodium Lactate Solution: Clear, colorless or practically colorless, slightly viscous liquid, odorless or having a slight, not unpleasant odor. Miscible with water. *NF category*: Buffering agent.

Sodium Lauryl Sulfate: Small, white or light yellow crystals having a slight, characteristic odor. Freely soluble in water, forming an opalescent solution. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sodium Metabisulfite: White crystals or white to yellowish, crystalline powder, having the odor of sulfur dioxide. Freely soluble in water and in glycerin; slightly soluble in alcohol. *NF category:* Antioxidant.

Sodium Monofluorophosphate: White to slightly gray, odorless powder. Freely soluble in water.

Sodium Nitrite: White to slightly yellow, granular powder, or white or practically white, opaque, fused masses or sticks. Has a mild, saline taste and is deliquescent in air. Its solutions are alkaline to litmus. Freely soluble in water; sparingly soluble in alcohol.

Sodium Nitrite Injection: Clear, colorless liquid.

Sodium Nitroprusside: Reddish-brown, practically odorless, crystals or powder. Freely soluble in water; slightly soluble in alcohol; very slightly soluble in chloroform; insoluble in benzene.

Dibasic Sodium Phosphate (dried): White powder that readily absorbs moisture. Freely soluble in water; insoluble in alcohol. *NF category:* Buffering agent.

Dibasic Sodium Phosphate (heptahydrate): Colorless or white, granular or caked salt. Effloresces in warm, dry air. Its solutions are alkaline to phenolphthalein TS, a 0.1 M solution having a pH of about 9. Freely soluble in water; very slightly soluble in alcohol. *NF category:* Buffering agent.

Monobasic Sodium Phosphate: Colorless crystals or white, crystalline powder. Is odorless and is slightly deliquescent. Its solutions are acid to litmus and effervesce with sodium carbonate. Freely soluble in water; practically insoluble in alcohol. *NF category:* Buffering agent.

Tribasic Sodium Phosphate: The formula for a crystalline material is approximately $4(\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O})\text{NaOH}$. It occurs as white, odorless crystals or granules or as a crystalline powder. Freely soluble in water; insoluble in alcohol. The pH of a 1 in 100 solution is between 11.5 and 12.0.

Sodium Polystyrene Sulfonate: Golden brown, fine powder. Is odorless and has a characteristic taste. Insoluble in water.

Sodium Propionate: Colorless, transparent crystals or granular, crystalline powder. Is odorless, or has a faint acetic-butyric odor and is deliquescent in moist air. Very soluble in water; soluble in alcohol. *NF category:* Antimicrobial preservative.

Sodium Salicylate: Amorphous or microcrystalline powder or scales. Is colorless, or has not more than a faint, pink tinge. Is odorless, or has a faint, characteristic odor, and is affected by light. A freshly made solution (1 in 10) is neutral or acid to litmus. Very soluble in boiling water and in boiling alcohol; freely (and slowly) soluble in water and in glycerin; slowly soluble in alcohol.

Sodium Starch Glycolate: White, tasteless, odorless, relatively free-flowing powder; available in several different viscosity grades. A 2% (w/v) dispersion in cold water settles, on standing, in the form of a highly hydrated layer. *NF category:* Tablet disintegrant.

Sodium Stearate: Fine, white powder, soapy to the touch, usually having a slight, tallow-like odor. Is affected by light. Its solutions are alkaline to phenolphthalein TS. Slowly soluble in cold water and in cold alcohol; readily soluble in hot water and in hot alcohol. *NF category:* Emulsifying and/or solubilizing agent.

Sodium Stearyl Fumarate: Fine, white powder. Slightly soluble in methanol; practically insoluble in water. *NF category:* Tablet and/or capsule lubricant.

Sodium Sulfate: Large, colorless, odorless, transparent crystals, or a granular powder. Effloresces rapidly in air, liquefies in its water of hydration at about 33°, and loses all of

its water of hydration at about 100°. Freely soluble in water; soluble in glycerin; insoluble in alcohol.

Sodium Sulfite: Colorless crystals. Freely soluble in water; very slightly soluble in alcohol. *NF category:* Antioxidant.

Sodium Tartrate: Transparent, colorless, odorless crystals. Freely soluble in water; insoluble in alcohol. *NF category:* Sequestering agent.

Sodium Thiosulfate: Large, colorless crystals or coarse, crystalline powder. Is deliquescent in moist air and effloresces in dry air at temperatures exceeding 33°. Its solutions are neutral or faintly alkaline to litmus. Very soluble in water; insoluble in alcohol. *NF category:* Antioxidant.

Sorbic Acid: Free-flowing, white, crystalline powder, having a characteristic odor. Soluble in alcohol and in ether; slightly soluble in water. *NF category:* Antimicrobial preservative.

Sorbitan Monolaurate: Yellow to amber-colored, oily liquid, having a bland, characteristic odor. Soluble in mineral oil; slightly soluble in cottonseed oil and in ethyl acetate; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sorbitan Monooleate: Viscous, yellow to amber-colored, oily liquid, having a bland, characteristic odor. Insoluble in water and in propylene glycol. Miscible with mineral and vegetable oils. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sorbitan Monopalmitate: Cream-colored, waxy solid having a faint fatty odor. Soluble in warm absolute alcohol; soluble, with haze, in warm peanut oil and in warm mineral oil; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sorbitan Monostearate: Cream-colored to tan, hard, waxy solid, having a bland odor and taste. Soluble, with haze, above 50° in mineral oil and in ethyl acetate; insoluble in cold water and in acetone. Dispersible in warm water. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sorbitan Sesquioleate: Viscous, yellow to amber-colored, oily liquid. Soluble in alcohol, in isopropyl alcohol, in cottonseed oil, and in mineral oil; insoluble in water and in propylene glycol. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sorbitan Trioleate: Yellow to amber-colored, oily liquid. Soluble in methyl alcohol, in alcohol, in isopropyl alcohol, in corn oil, in cottonseed oil, and in mineral oil; insoluble in water, in ethylene glycol, and in propylene glycol. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant; wetting and/or solubilizing agent.

Sorbitol: D-Sorbitol occurs as white granules, powder, or crystalline masses. Is odorless, and has a sweet taste with a cold sensation. Very soluble in water; sparingly soluble in alcohol; and practically insoluble in ethyl ether. Is hygroscopic. *NF category:* Humectant; sweetening agent; tablet and/or capsule diluent.

Sorbitol Solution: Clear, colorless, syrupy liquid. Is odorless and has a sweet taste. It sometimes separates into crystalline masses. Miscible with water, with alcohol, with glycerin, and with propylene glycol. Is neutral to litmus. *NF category:* Sweetening agent; vehicle (flavored and/or sweetened).

Sorbitol Sorbitan Solution: A clear, colorless to pale yellow, syrupy liquid. Is odorless and has a sweet taste. Insoluble in mineral oil and in vegetable oil. Miscible with water, with alcohol, with glycerin, and with propylene glycol. *NF category:* Humectant; plasticizer.

Sotalol Hydrochloride: White to off-white powder. Freely soluble in water; soluble in alcohol; very slightly soluble in chloroform.

Soybean Oil: Clear, pale yellow, oily liquid having a characteristic odor and taste. Insoluble in water. Miscible with ether and with chloroform. *Specific gravity* (841): between 0.916 and 0.922. *Refractive index* (831): between 1.465 and 1.475. *NF category:* Vehicle (oleaginous).

Hydrogenated Soybean Oil: A white mass or powder that melts to a clear, pale yellow liquid when heated. Freely soluble in methylene chloride, in hexane after heating, and in toluene; very slightly soluble in alcohol; practically insoluble in water. *NF category:* Emollient.

Spectinomycin Hydrochloride: White to pale-buff crystalline powder. Freely soluble in water; practically insoluble in alcohol, in chloroform, and in ether.

Spironolactone: Light cream-colored to light tan, crystalline powder. Has a faint to mild mercaptan-like odor; is stable in air. Freely soluble in benzene and in chloroform; soluble in ethyl acetate and in alcohol; slightly soluble in methanol and in fixed oils; practically insoluble in water.

Squalane: Colorless, practically odorless transparent oil. Slightly soluble in acetone; very slightly soluble in absolute alcohol; insoluble in water. Miscible with ether and with chloroform. *NF category:* Ointment base; vehicle (oleaginous).

Stannous Chloride: White, crystalline powder or colorless crystals, efflorescent in air. Freely soluble in water (the solution becomes cloudy after standing or on dilution) and in alcohol. Dissolves in dilute hydrochloric acid. *NF category:* Emulsifying agent; antioxidant.

Stannous Fluoride: White, crystalline powder, having a bitter, salty taste. Melts at about 213°. Freely soluble in water; practically insoluble in alcohol, in ether, and in chloroform.

Stanozolol: Odorless, crystalline powder, occurring in two forms: as needles, melting at about 155°, and as prisms, melting at about 235°. Soluble in dimethylformamide; sparingly soluble in alcohol and in chloroform; slightly soluble in ethyl acetate and in acetone; very slightly soluble in benzene; insoluble in water.

Starch: Irregular, angular, white masses or fine powder. Is odorless, and has a slight, characteristic taste. Insoluble in cold water and in alcohol. *NF category:* Tablet and/or capsule diluent; tablet disintegrant; tablet and/or capsule lubricant.

Corn Starch: Irregular, angular, white masses or fine powder. Is odorless, and has a slight, characteristic taste. Insoluble in cold water and in alcohol. *NF category:* Tablet and/or capsule diluent; tablet disintegrant; tablet binder; suspending and/or viscosity-increasing agent.

Hydroxypropyl Corn Starch: White or slightly yellowish powder. Practically insoluble in cold water and in alcohol. *NF category:* Tablet binder; tablet and/or capsule diluent; tablet disintegrant; suspending and/or viscosity-increasing agent.

Pregelatinized Hydroxypropyl Corn Starch: White or slightly yellowish powder. It swells in water and produces a clear or translucent, viscous, colloidal mixture. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Pea Starch: White or almost white, very fine powder. Practically insoluble in cold water and in alcohol. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Hydroxypropyl Pea Starch: White or slightly yellowish powder. Practically insoluble in cold water and in alcohol. *NF category:* Tablet binder; tablet and/or capsule diluent; tablet disintegrant; suspending and/or viscosity-increasing agent.

Pregelatinized Hydroxypropyl Pea Starch: White or slightly yellowish powder. It swells in water and produces a clear or translucent, viscous, colloidal mixture. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Potato Starch: Irregular, angular, white masses or fine powder. Is odorless, and has a slight, characteristic taste. Insoluble in cold water and in alcohol. *NF category:* Tablet and/or capsule diluent; tablet disintegrant; tablet binder; suspending and/or viscosity-increasing agent.

Hydroxypropyl Potato Starch: White or slightly yellowish powder. Practically insoluble in cold water and in alcohol. *NF category:* Tablet binder; tablet and/or capsule diluent; tablet disintegrant; suspending and/or viscosity-increasing agent.

Pregelatinized Hydroxypropyl Potato Starch: White or slightly yellowish powder. It swells in water and produces a clear or translucent, viscous, colloidal mixture. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Pregelatinized Starch: Moderately coarse to fine, white to off-white powder. Is odorless and has a slight, characteristic taste. Slightly soluble to soluble in cold water; insoluble in alcohol. *NF category:* Tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Pregelatinized Modified Starch: Moderately coarse to fine, white to off-white powder. Is odorless and has a slight, characteristic taste. Soluble to slightly soluble in cold water; insoluble in alcohol. *NF category:* Tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Tapioca Starch: Irregular, angular, white to pale yellow masses or fine powder. Insoluble in cold water and in alcohol. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant.

Wheat Starch: Irregular, angular, white masses or fine powder. Is odorless and has a slight, characteristic taste. Insoluble in cold water and in alcohol. *NF category:* Tablet and/or capsule diluent; tablet disintegrant; tablet binder; suspending and/or viscosity-increasing agent.

Hydrogenated Starch Hydrolysate: Concentrated, aqueous solution or spray-dried or dried powder. Very soluble in water; insoluble in alcohol. *NF category:* Sweetening agent; humectant; tablet binder; tablet and/or capsule diluent.

Stavudine: White to off-white, crystalline powder. Soluble in water, in dimethylacetamide, and in dimethyl sulfoxide; sparingly soluble in methanol, in alcohol, and in acetonitrile; slightly soluble in dichloromethane; insoluble in hexane.

Stearic Acid: Hard, white or faintly yellowish, somewhat glossy and crystalline solid, or white or yellowish-white powder. Its odor and taste are slight, suggesting tallow. Freely soluble in chloroform and in ether; soluble in alcohol; practically insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; tablet and/or capsule lubricant.

Purified Stearic Acid: Hard, white or faintly yellowish, somewhat glossy and crystalline solid, or white or yellowish-white powder. Its odor and taste are slight, suggesting tallow. Freely soluble in chloroform and in ether; soluble in alcohol; practically insoluble in water. *NF category:* Tablet and/or capsule lubricant.

Stearoyl Polyoxylglycerides: Pale yellow, waxy solids. Dispersible in warm water and in warm paraffin. Freely soluble in methylene chloride; soluble in warm methanol. *NF category:* Ointment base; solvent.

Stearyl Alcohol: Unctuous, white flakes or granules. Has a faint, characteristic odor and a bland, mild taste. Soluble in alcohol and in ether; insoluble in water. *NF category:* Stiffening agent.

Storax: Semiliquid, grayish to grayish-brown, sticky, opaque mass depositing on standing a heavy dark brown

layer (Levant Storax); or semisolid, sometimes a solid mass, softened by gently warming (American Storax). Is transparent in thin layers, has a characteristic odor and taste, and is more dense than water. Soluble, usually incompletely, in an equal weight of warm alcohol, in acetone, in carbon disulfide, and in ether, some insoluble residue usually remaining; insoluble in water.

Streptomycin Sulfate: White or practically white powder. Is odorless or has not more than a faint odor. Is hygroscopic, but is stable in air and on exposure to light. Its solutions are acid to practically neutral to litmus. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in chloroform.

Streptomycin Sulfate Injection: Clear, colorless to yellow, viscous liquid. Is odorless or has a slight odor.

Strontium Chloride: Colorless, odorless crystals or white granules. Effloresces in air; deliquesces in moist air. Very soluble in water; soluble in alcohol.

Succinic Acid: White, odorless crystals. Freely soluble in boiling water; soluble in water, in alcohol, and in glycerin. *NF category:* Buffering agent.

Succinylcholine Chloride: White, odorless, crystalline powder. Its solutions have a pH of about 4. The dihydrate form melts at about 160°; the anhydrous form melts at about 190°, and is hygroscopic. Freely soluble in water; slightly soluble in alcohol and in chloroform; practically insoluble in ether.

Sucralose: White to off-white, crystalline powder. Freely soluble in water, in methanol, and in alcohol; slightly soluble in ethyl acetate. *NF category:* Sweetening agent.

Sucrose: White, crystalline powder or lustrous, dry, colorless or white crystals. Very soluble in water; slightly soluble in alcohol; practically insoluble in dehydrated alcohol. *NF category:* Coating agent; sweetening agent; tablet and/or capsule diluent.

Sucrose Palmitate: White or almost white, unctuous powder. Sparingly soluble in ethanol (96%); very slightly soluble in water. *NF category:* Suspending and/or viscosity-increasing agent.

Sucrose Octaacetate: White, practically odorless powder, having an intensely bitter taste. Is hygroscopic. Very soluble in methanol and in chloroform; soluble in alcohol and in ether; very slightly soluble in water. *NF category:* Alcohol denaturant.

Sucrose Stearate: White or almost white, unctuous powder. Sparingly soluble in ethanol (96%); very slightly soluble in water. *NF category:* Tablet and/or capsule lubricant; emulsifying and/or solubilizing agent.

Sufentanil Citrate: White powder. Freely soluble in methanol; soluble in water; sparingly soluble in acetone, in alcohol, and in chloroform. Melts between 133° and 140°.

Compressible Sugar: Practically white, crystalline, odorless powder, having a sweet taste. Is stable in air. The sucrose portion of Compressible Sugar is very soluble in water. *NF category:* Sweetening agent; tablet and/or capsule diluent.

Confectioner's Sugar: Fine, white, odorless powder, having a sweet taste. Is stable in air. The sucrose portion of Confectioner's Sugar is soluble in cold water. Confectioner's Sugar is freely soluble in boiling water. *NF category:* Sweetening agent; tablet and/or capsule diluent.

Sugar Spheres: Hard, brittle, free-flowing, spherical masses ranging generally in size from 10- to 60-mesh. Usually white, but may be colored. Solubility in water varies according to the sugar-to-starch ratio. *NF category:* Vehicle (solid carrier).

Sulbactam Sodium: White to off-white, crystalline powder. Freely soluble in water and in dilute acid; sparingly soluble in acetone, in ethyl acetate, and in chloroform.

Sulconazole Nitrate: White to off-white, crystalline powder. Melts at about 130°, with decomposition. Freely

soluble in pyridine; sparingly soluble in methanol; slightly soluble in alcohol, in chloroform, in acetone, and in methylene chloride; very slightly soluble in water, in toluene, and in dioxane.

Sulfabenzamide: Fine, white, practically odorless powder. Soluble in alcohol, in acetone, and in sodium hydroxide TS; insoluble in water and in ether.

Sulfacetamide: White, crystalline powder, odorless and having a characteristic sour taste. Its aqueous solutions are sensitive to light, and are unstable when acidic or strongly alkaline. Freely soluble in dilute mineral acids and in solutions of potassium and sodium hydroxides; soluble in alcohol; slightly soluble in water and in ether; very slightly soluble in chloroform; practically insoluble in benzene.

Sulfacetamide Sodium: White, crystalline powder. Is odorless and has a bitter taste. Freely soluble in water; sparingly soluble in alcohol; practically insoluble in chloroform and in ether.

Sulfadiazine: White or slightly yellow powder. Is odorless or nearly odorless and is stable in air, but slowly darkens on exposure to light. Freely soluble in dilute mineral acids, in solutions of potassium and sodium hydroxides, and in ammonia TS; sparingly soluble in alcohol and in acetone; slightly soluble in human serum at 37°; practically insoluble in water.

Silver Sulfadiazine: White to creamy-white, crystalline powder, odorless to having a slight odor. Is stable in air, but turns yellow on exposure to light. Freely soluble in 30% ammonium solution; slightly soluble in acetone; practically insoluble in alcohol, in chloroform, and in ether. Decomposes in moderately strong mineral acids.

Sulfadiazine Sodium: White powder. On prolonged exposure to humid air it absorbs carbon dioxide with the liberation of sulfadiazine and becomes incompletely soluble in water. Its solutions are alkaline to phenolphthalein. Is affected by light. Freely soluble in water; slightly soluble in alcohol.

Sulfadimethoxine: Practically white, crystalline powder. Soluble in 2 N sodium hydroxide; sparingly soluble in 2 N hydrochloric acid; slightly soluble in alcohol, in ether, in chloroform, and in hexane; practically insoluble in water.

Sulfamethazine: White to yellowish-white powder, which may darken on exposure to light. Has a slightly bitter taste and is practically odorless. Soluble in acetone; slightly soluble in alcohol; very slightly soluble in water and in ether.

Sulfamethizole: White crystals or powder, having a slightly bitter taste. Is practically odorless, and has no odor of hydrogen sulfide. Freely soluble in solutions of ammonium, potassium, and sodium hydroxides; soluble in dilute mineral acids and in acetone; sparingly soluble in alcohol; very slightly soluble in water, in chloroform, and in ether; practically insoluble in benzene.

Sulfamethoxazole: White to off-white, practically odorless, crystalline powder. Freely soluble in acetone and in dilute solutions of sodium hydroxide; sparingly soluble in alcohol; practically insoluble in water, in ether, and in chloroform.

Sulfapyridine: White or faintly yellowish-white crystals, granules, or powder. Is odorless or practically odorless, and is stable in air, but slowly darkens on exposure to light. Freely soluble in dilute mineral acids and in solutions of potassium and sodium hydroxides; sparingly soluble in acetone; slightly soluble in alcohol; very slightly soluble in water.

Sulfasalazine: Bright yellow or brownish-yellow, odorless, fine powder. Melts at about 255°, with decomposition. Soluble in aqueous solutions of alkali hydroxides; very slightly soluble in alcohol; practically insoluble in water, in ether, in chloroform, and in benzene.

Sulfathiazole: Fine, white or faintly yellowish-white, practically odorless powder. Soluble in acetone, in dilute

mineral acids, in solutions of alkali hydroxides, and in 6 N ammonium hydroxide; slightly soluble in alcohol; very slightly soluble in water.

Sulfinpyrazone: White to off-white powder. Soluble in alcohol and in acetone; sparingly soluble in dilute alkali; practically insoluble in water and in solvent hexane.

Sulfisoxazole: White to slightly yellowish, odorless, crystalline powder. Soluble in boiling alcohol and in 3 N hydrochloric acid; very slightly soluble in water.

Sulfisoxazole Acetyl: White or slightly yellow, crystalline powder. Sparingly soluble in chloroform; slightly soluble in alcohol; practically insoluble in water.

Precipitated Sulfur: Very fine, pale yellow, amorphous or microcrystalline powder. Is odorless and tasteless. Very soluble in carbon disulfide; slightly soluble in olive oil; very slightly soluble in alcohol; practically insoluble in water.

Sublimed Sulfur: Fine, yellow, crystalline powder, having a faint odor and taste. Sparingly soluble in olive oil; practically insoluble in water and in alcohol.

Sulfur Dioxide: Colorless, nonflammable gas, possessing a strong, suffocating odor characteristic of burning sulfur. Under pressure, it condenses readily to a colorless liquid that boils at -10° and has a density of approximately 1.5. At 20° and at standard pressure, approximately 36 volumes dissolve in 1 volume of water and approximately 114 volumes dissolve in 1 volume of alcohol. Soluble also in ether and in chloroform. *NF category:* Antioxidant.

Sulfuric Acid: Clear, colorless, oily liquid. Miscible with water and with alcohol with the generation of much heat. Is very caustic and corrosive. Specific gravity is about 1.84. *NF category:* Acidifying agent.

Sulindac: Yellow, crystalline powder, which is odorless or practically so. Slightly soluble in methanol, in alcohol, in acetone, and in chloroform; very slightly soluble in isopropanol and in ethyl acetate; practically insoluble in hexane and in water.

Sulisobenzone: Light tan powder, with a melting point of about 145° . Freely soluble in methanol, in alcohol, and in water; sparingly soluble in ethyl acetate.

Sumatriptan: White to pale yellow powder. Very slightly soluble in water.

Sumatriptan Succinate: White or almost white powder. Freely soluble in water; sparingly soluble in methanol; practically insoluble in methylene chloride.

Suprofen: White to off-white powder, odorless to having a slight odor. Sparingly soluble in water.

Syrup: *NF category:* Sweetening agent; tablet binder; vehicle (flavored and/or sweetened).

Tacrine Hydrochloride: White powder. Freely soluble in water, in 0.1 N hydrochloric acid, in pH 4.0 acetate buffer, in phosphate buffer (pH between 7.0 and 7.4), in methanol, in dimethylsulfoxide, in alcohol, and in propylene glycol; sparingly soluble in linoleic acid and in polyethylene glycol 400.

Add the following:

▲ **Tadalafil:** White or almost white powder. Freely soluble in dimethyl sulfoxide; slightly soluble in methylene chloride; practically insoluble in water. ▲ *USP36*

Tagatose: White or almost white crystals, having a sweet taste. Very soluble in water; very slightly soluble in alcohol. *NF category:* Sweetening agent; humectant.

Talc: Very fine, white or grayish-white, crystalline powder. Is unctuous, adheres readily to the skin, and is free from grittiness. *NF category:* Glidant and/or anticaking agent; tablet and/or capsule lubricant.

Tamoxifen Citrate: White, fine, crystalline powder. Soluble in methanol; very slightly soluble in water, in acetone,

in chloroform, and in alcohol. Melts at about 142° , with decomposition.

Tamsulosin Hydrochloride: White or almost white crystalline powder. Melts with decomposition at approximately 230° . Freely soluble in formic acid; sparingly soluble in methanol; slightly soluble in water and in dehydrated alcohol; practically insoluble in ether.

Tannic Acid: Amorphous powder, glistening scales, or spongy masses, varying in color from yellowish-white to light brown. Is odorless or has a faint, characteristic odor, and has a strongly astringent taste. Very soluble in water, in acetone, and in alcohol; freely soluble in diluted alcohol; slightly soluble in dehydrated alcohol; practically insoluble in benzene, in chloroform, in ether, and in solvent hexane; 1 g dissolves in about 1 mL of warm glycerin.

Tartaric Acid: Colorless or translucent crystals or white, fine to granular, crystalline powder. Is odorless, has an acid taste, and is stable in air. Very soluble in water; freely soluble in alcohol. *NF category:* Acidifying agent.

Taurine: White crystals or crystalline powder. Soluble in water.

Tazobactam: White to pale yellow, nonhygroscopic, crystalline powder. Soluble in dimethylformamide; slightly soluble in water, in methanol, in acetone, and in alcohol; very slightly soluble in ethyl acetate, in ethyl ether, and in chloroform; insoluble in hexane.

Technetium Tc 99m Aggregated Albumin Injection: Milky suspension, from which particles settle upon standing.

Technetium Tc 99m Pentetate Injection: Clear, colorless solution.

Sodium Pertechnetate Tc 99m Injection: Clear, colorless solution.

Technetium Tc 99m (Pyro- and trimeta-) Phosphates Injection: Clear solution.

Technetium Tc 99m Sulfur Colloid Injection: Colloidal dispersion. Slightly opalescent, colorless to light tan liquid.

Telmisartan: White or slightly yellowish, crystalline powder. Sparingly soluble in methylene chloride; slightly soluble in methanol; practically insoluble in water. It dissolves in 1 M sodium hydroxide.

Temazepam: White or nearly white, crystalline powder. Sparingly soluble in alcohol; very slightly soluble in water. Melts between 157° and 163° , within a 3° range.

Temozolomide: White to light pink/light tan powder. Soluble in dimethyl sulfoxide; sparingly soluble in water; practically insoluble in toluene.

Terazosin Hydrochloride: White to pale yellow, crystalline powder. Freely soluble in isotonic saline solution; soluble in methanol and in water; slightly soluble in alcohol and in 0.1 N hydrochloric acid; very slightly soluble in chloroform; practically insoluble in acetone and in hexanes.

Terbinafine Hydrochloride: White or off-white powder. Freely soluble in dehydrated alcohol and in methanol; slightly soluble in acetone; very slightly or slightly soluble in water.

Terbutaline Sulfate: White to gray-white, crystalline powder. Is odorless or has a faint odor of acetic acid. Soluble in water and in 0.1 N hydrochloric acid; slightly soluble in methanol; insoluble in chloroform.

Terconazole: White to off-white powder. Freely soluble in methylene chloride; soluble in acetone; sparingly soluble in alcohol; practically insoluble in water. It exhibits polymorphism.

Terpin Hydrate: Colorless, lustrous crystals or white powder. Has a slight odor, and effloresces in dry air. A hot solution (1 in 100) is neutral to litmus. When dried in vacuum at 60° for 2 hours, it melts at about 103° . Very soluble in boiling alcohol; soluble in alcohol; sparingly soluble in boiling water; slightly soluble in water, in chloroform, and in ether.

Testolactone: White to off-white, practically odorless, crystalline powder. Melts at about 218°. Soluble in alcohol and in chloroform; slightly soluble in water and in benzyl alcohol; insoluble in ether and in solvent hexane.

Testosterone: White or slightly creamy white crystals or crystalline powder. Is odorless, and is stable in air. Freely soluble in dehydrated alcohol and in chloroform; soluble in dioxane and in vegetable oils; slightly soluble in ether; practically insoluble in water.

Testosterone Cypionate: White or creamy white, crystalline powder. Is odorless or has a slight odor, and is stable in air. Freely soluble in alcohol, in chloroform, in dioxane, and in ether; soluble in vegetable oils; insoluble in water.

Testosterone Enanthate: White or creamy white, crystalline powder. Is odorless or has a faint odor characteristic of heptanoic acid. Very soluble in ether; soluble in vegetable oils; insoluble in water.

Testosterone Propionate: White or creamy white crystals or crystalline powder. Is odorless and is stable in air. Freely soluble in alcohol, in dioxane, in ether, and in other organic solvents; soluble in vegetable oils; insoluble in water.

Tetanus Immune Globulin: Transparent or slightly opalescent liquid, practically colorless and practically odorless. May develop a slight granular deposit during storage.

Tetanus Toxoid: Clear, colorless to brownish-yellow, or slightly turbid liquid, free from evident clumps or particles, having a characteristic odor or an odor of formaldehyde.

Tetanus Toxoid Adsorbed: Turbid, white, slightly gray, or slightly pink suspension, free from evident clumps after shaking.

Tetanus and Diphtheria Toxoids Adsorbed for Adult Use: Turbid, white, slightly gray, or cream-colored suspension, free from evident clumps after shaking.

Tetracaine: White or light yellow, waxy solid. Soluble in alcohol, in ether, in benzene, and in chloroform; very slightly soluble in water.

Tetracaine Hydrochloride: Fine, white, crystalline, odorless powder. Has a slightly bitter taste followed by a sense of numbness. Its solutions are neutral to litmus. Melts at about 148°, or may occur in either of two other polymorphic modifications that melt at about 134° and 139°, respectively. Mixtures of the forms may melt within the range of 134° to 147°. Is hygroscopic. Very soluble in water; soluble in alcohol; insoluble in ether and in benzene.

Tetracycline: Yellow, odorless, crystalline powder. Is stable in air, but exposure to strong sunlight causes it to darken. It loses potency in solutions of pH below 2, and is rapidly destroyed by alkali hydroxide solutions. Freely soluble in dilute acid and in alkali hydroxide solutions; sparingly soluble in alcohol; very slightly soluble in water; practically insoluble in chloroform and in ether.

Tetracycline Hydrochloride: Yellow, odorless, crystalline powder. Is moderately hygroscopic. Is stable in air, but exposure to strong sunlight in moist air causes it to darken. It loses potency in solution at a pH below 2, and is rapidly destroyed by alkali hydroxide solutions. Soluble in water and in solutions of alkali hydroxides and carbonates; slightly soluble in alcohol; practically insoluble in chloroform and in ether.

Tetrahydrozoline Hydrochloride: White, odorless solid. Melts at about 256°, with decomposition. Freely soluble in water and in alcohol; very slightly soluble in chloroform; practically insoluble in ether.

Thalidomide: White to off-white powder. Very soluble in dimethylformamide, in dioxane, and in pyridine; sparingly soluble in acetone, in butyl acetate, in ethanol, in ethyl acetate, in glacial acetic acid, in methanol, and in water; practically insoluble in benzene, in chloroform, and in ether.

Theophylline: White, odorless, crystalline powder, having a bitter taste. Is stable in air. Freely soluble in solutions of alkali hydroxides and in ammonia; sparingly soluble in alcohol, in chloroform, and in ether; slightly soluble in water, but more soluble in hot water.

Theophylline Sodium Glycinate: White, crystalline powder having a slight ammoniacal odor and a bitter taste. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in chloroform.

Thiabendazole: White to practically white, odorless or practically odorless powder. Slightly soluble in acetone and in alcohol; very slightly soluble in chloroform and in ether; practically insoluble in water.

Thiacetarsamide: White to yellowish, crystalline powder. Soluble in warm dehydrated alcohol and in warm methanol; sparingly soluble in cold dehydrated alcohol, in cold methanol, and in cold water; more soluble in water above 90°; insoluble in warm isopropyl alcohol. pK_a is 4.

Thiamine Hydrochloride: White crystals or crystalline powder, usually having a slight, characteristic odor. When exposed to air, the anhydrous product rapidly absorbs about 4% of water. Melts at about 248°, with some decomposition. Freely soluble in water; soluble in glycerin; slightly soluble in alcohol; insoluble in ether and in benzene.

Thiamine Mononitrate: White crystals or crystalline powder, usually having a slight, characteristic odor. Slightly soluble in water; slightly soluble in alcohol; very slightly soluble in chloroform.

Thiethylperazine Maleate: Yellowish, granular powder. Is odorless or has not more than a slight odor. Melts at about 183°, with decomposition. Slightly soluble in methanol; practically insoluble in water and in chloroform.

Thimerosal: Light cream-colored, crystalline powder, having a slight characteristic odor. Is affected by light. The pH of a solution (1 in 100) is about 6.7. Freely soluble in water; soluble in alcohol; practically insoluble in ether. *NF* category: Antimicrobial preservative.

Thimerosal Topical Solution: Clear liquid, having a slight characteristic odor. Is affected by light.

Thimerosal Tincture: Transparent, mobile liquid, having the characteristic odor of alcohol and acetone. Is affected by light.

Thioguanine: Pale yellow, odorless or practically odorless, crystalline powder. Freely soluble in dilute solutions of alkali hydroxides; insoluble in water, in alcohol, and in chloroform.

Thiopental Sodium: White to off-white, crystalline powder, or yellowish-white to pale greenish-yellow, hygroscopic powder. May have a disagreeable odor. Its solutions are alkaline to litmus. Its solutions decompose on standing, and on boiling precipitation occurs. Soluble in water and in alcohol; insoluble in benzene, in absolute ether, and in solvent hexane.

Thiopental Sodium for Injection: White to off-white, crystalline powder, or yellowish-white to pale greenish-yellow, hygroscopic powder. May have a disagreeable odor. Its solutions are alkaline to litmus. Its solutions decompose on standing, and on boiling precipitation occurs.

Thioridazine: White to slightly yellow, crystalline or micronized powder, odorless or having a faint odor. Very soluble in chloroform; freely soluble in dehydrated alcohol and in ether; practically insoluble in water.

Thioridazine Hydrochloride: White to slightly yellow, granular powder, having a faint odor and a very bitter taste. Freely soluble in water, in methanol, and in chloroform; insoluble in ether.

Thiostrepton: White to off-white, crystalline solid. Soluble in glacial acetic acid, in chloroform, in dimethylformamide, in dimethyl sulfoxide, in dioxane, and in pyridine; practically insoluble in water, in the lower alcohols, in

nonpolar organic solvents, and in dilute aqueous acids or alkali.

Thiotepa: Fine, white, crystalline flakes, having a faint odor. Freely soluble in water, in alcohol, in chloroform, and in ether.

Thiotepa for Injection: White powder.

Thiothixene: White to tan, practically odorless crystals. Is affected by light. Very soluble in chloroform; slightly soluble in methanol and in acetone; practically insoluble in water.

Thiothixene Hydrochloride: White, or practically white, crystalline powder, having a slight odor. Is affected by light. Soluble in water; slightly soluble in chloroform; practically insoluble in benzene, in acetone, and in ether.

Threonine: White, odorless crystals, having a slightly sweet taste. Freely soluble in water; insoluble in absolute alcohol, in ether, and in chloroform.

Thrombin: White to grayish, amorphous substance dried from the frozen state.

Thymol: Colorless, often large, crystals, or white, crystalline powder, having an aromatic, thyme-like odor and a pungent taste. Is affected by light. Its alcohol solution is neutral to litmus. Freely soluble in alcohol, in chloroform, in ether, and in olive oil; soluble in glacial acetic acid and in fixed and volatile oils; very slightly soluble in water. *NF category:* Antimicrobial preservative; flavors and perfumes.

Thyroid: Yellowish to buff-colored, amorphous powder, having a slight, characteristic, meat-like odor and a saline taste.

Tiagabine Hydrochloride: White to off-white powder. Freely soluble in methanol and in alcohol; soluble in isopropanol; very slightly soluble in chloroform; sparingly soluble in water; practically insoluble in *n*-heptane.

Tiamulin: A sticky, translucent yellowish mass, slightly hygroscopic. Very soluble in dichloromethane; freely soluble in dehydrated alcohol; practically insoluble in water.

Ticarcillin Disodium: White to pale yellow powder, or white to pale yellow solid. Freely soluble in water.

Ticlopidine: White or almost white crystalline powder. Sparingly soluble in water and in alcohol; very slightly soluble in ethyl acetate.

Tiletamine Hydrochloride: White to off-white, crystalline powder. Freely soluble in water and in 0.1 N hydrochloric acid; soluble in methanol; slightly soluble in chloroform; practically insoluble in ether.

Tilmicosin: White to off-white, amorphous solid. Slightly soluble in water and in *n*-hexane.

Timolol Maleate: White to practically white, odorless or practically odorless powder. Soluble in water, in alcohol, and in methanol; sparingly soluble in chloroform and in propylene glycol; insoluble in ether and in cyclohexane.

Tinidazole: Almost white or pale yellow, crystalline powder. Soluble in acetone and in methylene chloride; sparingly soluble in methanol; practically insoluble in water.

Titanium Dioxide: White, odorless, tasteless powder. Its 1 in 10 suspension in water is neutral to litmus. Insoluble in water, in hydrochloric acid, in nitric acid, and in 2 N sulfuric acid. Dissolves in hydrofluoric acid and in hot sulfuric acid. Is rendered soluble by fusion with potassium bisulfate or with alkali carbonates or hydroxides. *NF category:* Coating agent.

Tizanidine Hydrochloride: Almost white to slightly yellow, crystalline powder. Slightly soluble in water and in methanol.

Tobramycin: White to off-white, hygroscopic powder. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in chloroform and in ether.

Tobramycin Sulfate Injection: Clear, colorless solution.

Tocainide Hydrochloride: Fine, white, odorless powder. Freely soluble in water and in alcohol; practically insoluble in chloroform and in ether.

Tocopherol: Clear, colorless to yellow, yellowish-brown, or greenish-yellow, viscous oil. Is odorless. Soluble in oils, in fats, in acetone, in alcohol, in chloroform, in ether, and in alcohol; insoluble in water. *NF category:* Antioxidant.

Tocopherols Excipient: Brownish-red to red, clear, viscous oil, having a mild, characteristic odor and taste. May show a slight separation of waxlike constituents in microcrystalline form. Oxidizes and darkens slowly in air and on exposure to light, particularly in alkaline media. Soluble in alcohol; insoluble in water. Miscible with acetone, with chloroform, with ether, and with vegetable oils. *NF category:* Antioxidant.

Tolazamide: White to off-white, crystalline powder, odorless or having a slight odor. Melts with decomposition in the approximate range of 161° to 173°. Freely soluble in chloroform; soluble in acetone; slightly soluble in alcohol; very slightly soluble in water.

Tolazoline Hydrochloride: White to off-white, crystalline powder. Its solutions are slightly acid to litmus. Freely soluble in water and in alcohol.

Tolbutamide: White, or practically white, crystalline powder. Is slightly bitter and practically odorless. Soluble in alcohol and in chloroform; practically insoluble in water.

Tolbutamide Sodium: White to off-white, practically odorless, crystalline powder, having a slightly bitter taste. Freely soluble in water; soluble in alcohol and in chloroform; very slightly soluble in ether.

Tolcapone: Yellow, fine powder or fine powder with lumps. Freely soluble in acetone and in tetrahydrofuran; soluble in methanol and in ethyl acetate; sparingly soluble in chloroform and in dichloromethane; insoluble in water and in *n*-hexane.

Tolmetin Sodium: Light yellow to light orange, crystalline powder. Freely soluble in water and in methanol; slightly soluble in alcohol; very slightly soluble in chloroform.

Tolnaftate: White to creamy white, fine powder, having a slight odor. Freely soluble in acetone and in chloroform; sparingly soluble in ether; slightly soluble in alcohol; practically insoluble in water.

Tolu Balsam: Brown or yellowish-brown, plastic solid, transparent in thin layers and brittle when old, dried, or exposed to cold temperatures. Has a pleasant, aromatic odor resembling that of vanilla, and a mild, aromatic taste. Soluble in alcohol, in chloroform, and in ether, sometimes with slight residue or turbidity; practically insoluble in water and in solvent hexane. *NF category:* Flavors and perfumes.

Topiramate: White to off-white powder. Freely soluble in dichloromethane.

Torsemide: White to off-white, crystalline powder. Slightly soluble in 0.1 N sodium hydroxide, in 0.1 N hydrochloric acid, in alcohol, and in methanol; very slightly soluble in acetone and in chloroform; practically insoluble in water and in ether.

Tragacanth: Is odorless, and has an insipid, mucilaginous taste. *NF category:* Suspending and/or viscosity-increasing agent.

Tramadol Hydrochloride: White, crystalline powder. Freely soluble in water and in methanol; very slightly soluble in acetone.

Trandolopril: White or almost white powder. Freely soluble in methylene chloride; sparingly soluble in absolute alcohol; practically insoluble in water.

Tranexamic Acid: White, crystalline powder. Freely soluble in water and in glacial acetic acid; practically insoluble in acetone and in alcohol.

Tranlycypromine Sulfate: White or almost white crystalline powder. Freely soluble in water; very slightly soluble in alcohol and in ether; practically insoluble in chloroform.

Travoprost: Clear, colorless, viscous oil. Insoluble in water.

Trazodone Hydrochloride: White to off-white, crystalline powder. Sparingly soluble in chloroform and in water. Melts between 231° and 234° when the melting point determination is carried out in an evacuated capillary tube; otherwise melts with decomposition over a broad range below 230°.

Trehalose: White, odorless, nonhygroscopic crystalline powder. Soluble in water, solubility increases with temperature; practically insoluble in dehydrated alcohol. Trehalose is typically used in the dihydrate form. *NF category:* Bulking agent for freeze drying; sweetening agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant; vehicle (flavored and/or sweetened).

Tretinoin: Yellow to light-orange, crystalline powder. Slightly soluble in alcohol, in chloroform, and in methanol; insoluble in water.

Triacetin: Colorless, somewhat oily liquid having a slight, fatty odor and a bitter taste. Soluble in water; slightly soluble in carbon disulfide. Miscible with alcohol, with ether, and with chloroform. *NF category:* Plasticizer.

Triamcinolone: White or practically white, odorless, crystalline powder. Slightly soluble in alcohol and in methanol; very slightly soluble in water, in chloroform, and in ether.

Triamcinolone Acetonide: White to cream-colored, crystalline powder, having not more than a slight odor. Sparingly soluble in dehydrated alcohol, in chloroform, and in methanol; practically insoluble in water.

Triamcinolone Diacetate: Fine, white to off-white, crystalline powder, having not more than a slight odor. Soluble in chloroform; sparingly soluble in alcohol and in methanol; slightly soluble in ether; practically insoluble in water.

Triamcinolone Hexacetonide: White to cream-colored powder. Soluble in chloroform; slightly soluble in methanol; practically insoluble in water.

Triamterene: Yellow, odorless, crystalline powder. Soluble in formic acid; sparingly soluble in methoxyethanol; very slightly soluble in acetic acid, in alcohol, and in dilute mineral acids; practically insoluble in water, in benzene, in chloroform, in ether, and in dilute alkali hydroxides.

Triazolam: White to off-white, practically odorless, crystalline powder. Soluble in chloroform; slightly soluble in alcohol; practically insoluble in ether and in water.

Tributyl Citrate: Clear, practically colorless, oily liquid. Freely soluble in alcohol, in isopropyl alcohol, in acetone, and in toluene; insoluble in water. *NF category:* Plasticizer.

Trichlorfon: White crystalline powder. Very soluble in methylene chloride; freely soluble in acetone, in alcohol, in benzene, in chloroform, in ether, and in water; very slightly soluble in hexane and in pentane. Decomposed by alkali. Melts at about 78° with decomposition.

Trichlormethiazide: White or practically white, crystalline powder. Is odorless, or has a slight characteristic odor. Melts at about 274°, with decomposition. Freely soluble in acetone; soluble in methanol; sparingly soluble in alcohol; very slightly soluble in water, in ether, and in chloroform.

Trichloromonofluoromethane: Clear, colorless gas, having a faint, ethereal odor. Its vapor pressure at 25° is about 796 mm of mercury (1 psig). *NF category:* Aerosol propellant.

Triclosan: Fine, whitish, crystalline powder. Melts at about 57°. Soluble in methanol, in alcohol, and in acetone; slightly soluble in hexane; practically insoluble in water.

Trientine Hydrochloride: White to pale yellow, crystalline powder. Melts at about 117°. Freely soluble in water;

soluble in methanol; slightly soluble in alcohol; insoluble in chloroform and in ether.

Triethyl Citrate: Practically colorless, oily liquid. Soluble in water. Miscible with alcohol and with ether. *NF category:* Plasticizer.

Trifluoperazine Hydrochloride: White to pale yellow, crystalline powder. Is practically odorless, and has a bitter taste. Melts at about 242°, with decomposition. Freely soluble in water; soluble in alcohol; sparingly soluble in chloroform; insoluble in ether and in benzene.

Triflupromazine: Viscous, light amber-colored, oily liquid, which crystallizes on prolonged standing into large, irregular crystals. Practically insoluble in water.

Triflupromazine Hydrochloride: White to pale tan, crystalline powder, having a slight, characteristic odor. Melts between 170° and 178°. Soluble in water, in alcohol, and in acetone; insoluble in ether.

Trifluridine: Odorless, white powder appearing under the microscope as rodlike crystals; melts at 175°, with sublimation.

Medium-Chain Triglycerides: Colorless or slightly yellowish, oily liquid. Practically insoluble in water. Miscible with alcohol, with methylene chloride, with hexane, and with fatty oils.

Trihexyphenidyl Hydrochloride: White or slightly off-white, crystalline powder, having not more than a very faint odor. Melts at about 250°. Soluble in alcohol and in chloroform; slightly soluble in water.

Timeprazine Tartrate: White to off-white, odorless, crystalline powder. Freely soluble in water and in chloroform; soluble in alcohol; very slightly soluble in ether and in benzene.

Trimethobenzamide Hydrochloride: White, crystalline powder having a slight phenolic odor. Soluble in water and in warm alcohol; insoluble in ether and in benzene.

Trimethoprim: White to cream-colored, odorless crystals, or crystalline powder. Soluble in benzyl alcohol; sparingly soluble in chloroform and in methanol; slightly soluble in alcohol and in acetone; very slightly soluble in water; practically insoluble in ether and in carbon tetrachloride.

Trimethoprim Sulfate: White to off-white, crystalline powder. Soluble in water, in alcohol, in dilute mineral acids, and in fixed alkalies.

Trimipramine Maleate: White to almost white crystalline powder. Slightly soluble in water and in alcohol.

Trioxsalen: White to off-white or grayish, odorless, crystalline solid. Melts at about 230°. Sparingly soluble in chloroform; slightly soluble in alcohol; practically insoluble in water.

Tripelennamine Hydrochloride: White, crystalline powder. Slowly darkens on exposure to light. Its solutions are practically neutral to litmus. Freely soluble in water, in alcohol, and in chloroform; slightly soluble in acetone; insoluble in benzene, in ether, and in ethyl acetate.

Tripolidine Hydrochloride: White, crystalline powder, having no more than a slight, but unpleasant, odor. Its solutions are alkaline to litmus, and it melts at about 115°. Soluble in water, in alcohol, and in chloroform; insoluble in ether.

Trolamine: Colorless to pale yellow, viscous, hygroscopic liquid having a slight, ammoniacal odor. Soluble in chloroform. Miscible with water and with alcohol. *NF category:* Alkalinizing agent; emulsifying and/or solubilizing agent.

Troleandomycin: White, odorless, crystalline powder. Freely soluble in alcohol; soluble in chloroform; slightly soluble in ether and in water.

Tromethamine: White, crystalline powder, having a slight, characteristic odor. Freely soluble in water.

Tropicamide: White or practically white, crystalline powder, odorless or having not more than a slight odor.

Freely soluble in chloroform and in solutions of strong acids; slightly soluble in water.

Tropium Chloride: Colorless or white to slightly yellow crystalline powder. Very soluble in water; freely soluble in methanol.

Crystallized Trypsin: White to yellowish white, odorless, crystalline or amorphous powder.

Tryptophan: White to slightly yellowish-white crystals or crystalline powder, having a slightly bitter taste. Soluble in hot alcohol and in dilute hydrochloric acid.

Tuberculin: Old Tuberculin is a clear, brownish liquid, which is readily miscible with water and has a characteristic odor. Purified Protein Derivative (PPD) of Tuberculin is a very slightly opalescent, colorless solution. Old Tuberculin and PPD concentrates contain 50% of glycerin for use with various application devices. Old Tuberculin and PPD are also dried on the tines of multiple-puncture devices.

Tubocurarine Chloride: White or yellowish-white to grayish-white, crystalline powder. Melts at about 270°, with decomposition. Soluble in water; sparingly soluble in alcohol.

Tylosin: White to buff-colored powder. Freely soluble in methanol; soluble in alcohol, in amyl acetate, in chloroform, and in dilute mineral acids; slightly soluble in water.

Tylosin Tartrate: Almost white or slightly yellow, hygroscopic powder. Freely soluble in water and in dichloromethane; slightly soluble in alcohol. It dissolves in dilute solutions of mineral acids.

Tyloxapol: Viscous, amber liquid, having a slight, aromatic odor. May exhibit a slight turbidity. Slowly but freely miscible with water. Soluble in glacial acetic acid, in benzene, in toluene, in carbon tetrachloride, in chloroform, and in carbon disulfide. *NF category:* Wetting and/or solubilizing agent.

Tyrosine: White, odorless, tasteless crystals or crystalline powder. Very slightly soluble in water; insoluble in alcohol and in ether.

Ubidecarenone: Yellow to orange, crystalline powder. Melts at about 48°. Soluble in ether; very slightly soluble in dehydrated alcohol; practically insoluble in water.

Undecylenic Acid: Clear, colorless to pale yellow liquid having a characteristic odor. Practically insoluble in water. Miscible with alcohol, with chloroform, with ether, with benzene, and with fixed and volatile oils.

Urea: Colorless to white, prismatic crystals, or white, crystalline powder, or small white pellets. Is practically odorless, but may gradually develop a slight odor of ammonia upon long standing. Its solutions are neutral to litmus. Freely soluble in water and in boiling alcohol; practically insoluble in chloroform and in ether.

Urea C 13: See *Urea*.

Ursodiol: White or almost white, crystalline powder. Freely soluble in alcohol and in glacial acetic acid; sparingly soluble in chloroform; slightly soluble in ether; practically insoluble in water.

Vaccinia Immune Globulin: Transparent or slightly opalescent liquid. Is practically colorless and practically odorless. May develop a slight, granular deposit during storage.

Valacyclovir Hydrochloride: White to off-white powder. Soluble in water; insoluble in dichloromethane.

Powdered Valerian Extract: Brown, hygroscopic, powdery or easily pulverizable mass. Soluble in water to form a slightly cloudy solution; sparingly soluble in 70 percent alcohol; practically insoluble in alcohol.

Valganciclovir Hydrochloride: White to off-white powder. Very slightly soluble in alcohol; practically insoluble in 2-propanol, in hexane, in acetone, and in ethyl acetate.

Valine: White, odorless, tasteless crystals. Soluble in water; practically insoluble in ether, in alcohol, and in acetone.

Valproic Acid: Colorless to pale yellow, slightly viscous, clear liquid, having a characteristic odor. Refractive index: about 1.423 at 20°. Freely soluble in 1 N sodium hydroxide, in methanol, in alcohol, in acetone, in chloroform, in benzene, in ether, and in *n*-heptane; slightly soluble in water and in 0.1 N hydrochloric acid.

Valrubicin: Orange to orange-red, crystalline powder. Soluble in methylene chloride, in dehydrated alcohol, in methanol, and in acetone; very slightly soluble in water, in hexane, and in petroleum ether.

Valsartan: White or almost white, hygroscopic powder. Freely soluble in anhydrous ethanol; sparingly soluble in methylene chloride; practically insoluble in water.

Vancomycin Hydrochloride: White, almost white, or tan to brown, free-flowing powder, odorless, and having a bitter taste. Freely soluble in water; insoluble in ether and in chloroform.

Vanillin: Fine, white to slightly yellow crystals, usually needle-like, having an odor and taste suggestive of vanilla. Is affected by light. Its solutions are acid to litmus. Freely soluble in alcohol, in chloroform, in ether, and in solutions of the fixed alkali hydroxides; soluble in glycerin and in hot water; slightly soluble in water. *NF category:* Flavors and perfumes.

Vasopressin Injection: Clear, colorless or practically colorless liquid, having a faint, characteristic odor.

Vecuronium Bromide: White or creamy white crystals, or a crystalline powder. Sparingly soluble in alcohol; slightly soluble in water and in acetone.

Hydrogenated Vegetable Oil: Type I Hydrogenated Vegetable Oil—Fine, white powder, beads, or small flakes. Type II Hydrogenated Vegetable Oil—Plastic (semi-solid) or flakes having a softer consistency than Type I. Soluble in hot isopropyl alcohol, in hexane, and in chloroform; insoluble in water. *NF category:* Type I Hydrogenated Vegetable Oil—Tablet and/or capsule lubricant; Type II Hydrogenated Vegetable Oil—Ointment base.

Venlafaxine Hydrochloride: Off-white to white crystalline powder. Soluble in methanol and in water.

Verapamil Hydrochloride: White or practically white, crystalline powder. Is practically odorless and has a bitter taste. Freely soluble in chloroform; soluble in water; sparingly soluble in alcohol; practically insoluble in ether.

Vidarabine: White to off-white powder. Slightly soluble in dimethylformamide; very slightly soluble in water.

Vinblastine Sulfate: White or slightly yellow, odorless, amorphous or crystalline powder. Is hygroscopic. Freely soluble in water.

Vincristine Sulfate: White to slightly yellow, odorless, amorphous or crystalline powder. Is hygroscopic. Freely soluble in water; soluble in methanol; slightly soluble in alcohol.

Vincristine Sulfate for Injection: Yellowish-white solid, having the characteristic appearance of products prepared by freeze-drying.

Vinorelbine Tartrate: White to yellow or light brown, amorphous powder. Freely soluble in water.

Vitamin A: In liquid form, a light-yellow to red oil that may solidify upon refrigeration. In solid form, has the appearance of any diluent that has been added. May be practically odorless or may have a mild fishy odor, but has no rancid odor or taste. Is unstable to air and light. In liquid form, very soluble in chloroform and in ether; soluble in absolute alcohol and in vegetable oils; insoluble in water and in glycerin. In solid form, may be dispersible in water.

Vitamin E: Practically odorless and tasteless. The alpha tocopherols and alpha tocopheryl acetates occur as clear, yellow, or greenish yellow, viscous oils. *d*-Alpha tocopheryl

acetate may solidify in the cold. Alpha tocopheryl acid succinate occurs as a white powder; the *d*-isomer melts at about 75°, and the *dl*-form melts at about 70°. The alpha tocopherols are unstable to air and light, particularly when in alkaline media. The esters are stable to air and light, but are unstable to alkali; the acid succinate is also unstable when held molten. Alpha tocopheryl acid succinate is very soluble in chloroform; soluble in alcohol, in ether, in acetone, and in vegetable oils; slightly soluble in alkaline solutions; insoluble in water. The other forms of Vitamin E are insoluble in water; soluble in alcohol; miscible with ether, with acetone, with vegetable oils, and with chloroform.

Vitamin E Preparation: The liquid forms are clear, yellow to brownish red, viscous oils. The solid forms are white to tan-white granular powders. The liquid forms are soluble in alcohol; insoluble in water. Miscible with ether, with acetone, with vegetable oils, and with chloroform. The solid forms disperse in water to give cloudy suspensions.

Voriconazole: White to almost white powder. Freely soluble in acetone and in methylene chloride; very slightly soluble in water.

Warfarin Sodium: White, odorless, amorphous or crystalline powder, having a slightly bitter taste. Is discolored by light. Very soluble in water; freely soluble in alcohol; very slightly soluble in chloroform and in ether.

Water for Injection: Clear, colorless, odorless liquid. *NF category:* Solvent.

Bacteriostatic Water for Injection: Clear, colorless liquid, odorless or having the odor of the antimicrobial substance. *NF category:* Vehicle (sterile).

Sterile Water for Inhalation: Clear, colorless solution.

Sterile Water for Injection: Clear, colorless, odorless liquid. *NF category:* Solvent.

Sterile Water for Irrigation: Clear, colorless, odorless liquid. *NF category:* Solvent.

Purified Water: Clear, colorless, odorless liquid. *NF category:* Solvent.

Carnauba Wax: Light brown to pale yellow, moderately coarse powder or flakes, possessing a characteristic bland odor, and free from rancidity. Specific gravity is about 0.99. Freely soluble in warm benzene; soluble in warm chloroform and in warm toluene; slightly soluble in boiling alcohol; insoluble in water. *NF category:* Coating agent.

Emulsifying Wax: Creamy white, wax-like solid, having a mild, characteristic odor. Freely soluble in ether, in chloroform, in most hydrocarbon solvents, and in aerosol propellants; soluble in alcohol; insoluble in water. *NF category:* Emulsifying and/or solubilizing agent; stiffening agent.

Microcrystalline Wax: White or cream-colored, odorless, waxy solid. Soluble in chloroform, in ether, in volatile oils, and in most warm fixed oils; sparingly soluble in dehydrated alcohol; insoluble in water. *NF category:* Coating agent.

White Wax: Yellowish-white solid, somewhat translucent in thin layers. Has a faint, characteristic odor, and is free from rancidity. Specific gravity is about 0.95. Sparingly soluble in cold alcohol; insoluble in water. Boiling alcohol dissolves the cerotic acid and a portion of the myricin, which are constituents of White Wax. Completely soluble in chloroform, in ether, and in fixed and volatile oils. Partly soluble in cold benzene and in cold carbon disulfide; completely soluble in these liquids at about 30°. *NF category:* Stiffening agent.

Yellow Wax: Solid varying in color from yellow to grayish brown. Has an agreeable, honey-like odor. Is somewhat brittle when cold, and presents a dull, granular, noncrystalline fracture when broken. It becomes pliable from the heat of the hand. Specific gravity is about 0.95. Sparingly soluble in cold alcohol; insoluble in water. Boiling alcohol dissolves the cerotic acid and a portion of the myricin, that are constituents of Yellow Wax. Soluble in chloroform, in ether, in fixed oils, and in volatile oils; sparingly soluble in cold ben-

zene and in cold carbon disulfide; soluble in these liquids at about 30°. *NF category:* Stiffening agent.

Wheat Bran: Light tan powder having a characteristic aroma. Practically insoluble in cold water and in alcohol. Available in a variety of particle sizes depending upon the degree of milling to which it is subjected. Color and flavor development variable, depending on the extent to which it is heat-stabilized.

Xanthan Gum: Cream-colored powder. Its solutions in water are neutral to litmus. Soluble in hot or cold water. *NF category:* Suspending and/or viscosity-increasing agent.

Xenon Xe 127: Clear, colorless gas.

Xenon Xe 133 Injection: Clear, colorless solution.

Xylazine: Colorless to white crystals. Sparingly soluble in dilute acid, in acetone, and in chloroform; insoluble in dilute alkali.

Xylazine Hydrochloride: Colorless to white crystals. Sparingly soluble in dilute acid, in acetone, and in methanol; insoluble in dilute alkali.

Xylitol: White crystals or crystalline powder. It has a sweet taste and produces a cooling sensation in the mouth. One g dissolves in about 0.65 mL of water. Sparingly soluble in alcohol. Crystalline xylitol has a melting range between 92° and 96°.

Xylometazoline Hydrochloride: White to off-white, odorless, crystalline powder. Melts above 300°, with decomposition. Freely soluble in alcohol; soluble in water; sparingly soluble in chloroform; practically insoluble in benzene and in ether.

Xylose: Colorless needles or white, crystalline powder. Is odorless, and has a slightly sweet taste. Very soluble in water; slightly soluble in alcohol.

Yellow Fever Vaccine: Slightly dull, light-orange colored, flaky or crustlike, desiccated mass.

Yohimbine Hydrochloride: White to yellow powder. Melts at about 295°, with decomposition. Soluble in boiling water; slightly soluble in water and in alcohol.

Yttrium Chloride: Colorless, deliquescent crystals. Soluble in water and in alcohol.

Zalcitabine: White to off-white, crystalline powder. Soluble in water and in methanol; sparingly soluble in alcohol, in acetonitrile, in chloroform, and in methylene chloride; slightly soluble in cyclohexane.

Zaleplon: White to off-white powder. Sparingly soluble in alcohol; slightly soluble in propylene glycol; practically insoluble in water.

Zein: White to yellow powder. Soluble in aqueous alcohols, in glycols, in ethylene glycol ethyl ether, in furfuryl alcohol, in tetrahydrofurfuryl alcohol, in aqueous alkaline solutions of pH 11.5 or greater, and in acetone-water mixtures between the limits of 60% and 80% of acetone by volume; insoluble in water, in acetone, and in all anhydrous alcohols except methanol. *NF category:* Coating agent.

Zidovudine: White to yellowish powder. Melts at about 124°. Exhibits polymorphism. Soluble in alcohol; sparingly soluble in water.

Zileuton: White to off-white powder.

Zinc Acetate: White crystals or granules, having a slight acetous odor and an astringent taste. Is slightly efflorescent. Freely soluble in water and in boiling alcohol; slightly soluble in alcohol.

Zinc Chloride: White or practically white, odorless, crystalline powder, or white or practically white crystalline granules. May also be in porcelain-like masses or molded into cylinders. Is very deliquescent. A solution (1 in 10) is acid to litmus. Very soluble in water; freely soluble in alcohol and in glycerin. Its solution in water or in alcohol is usually slightly turbid, but the turbidity disappears when a small quantity of hydrochloric acid is added.

Zinc Gluconate: White or practically white powder or granules. Soluble in water; very slightly soluble in alcohol.

Zinc Oxide: Very fine, odorless, amorphous, white or yellowish white powder, free from gritty particles. It gradually absorbs carbon dioxide from air. Soluble in dilute acids; insoluble in water and in alcohol.

Zinc Stearate: Fine, white, bulky powder, free from grittiness. Has a faint, characteristic odor. Is neutral to moistened litmus paper. Insoluble in water, in alcohol, and in ether. *NF category:* Tablet and/or capsule lubricant.

Zinc Sulfate: Colorless, transparent prisms, or small needles. May occur as a white, granular, crystalline powder. Is odorless and is efflorescent in dry air. Its solutions are acid to litmus. Very soluble in water (heptahydrate); freely soluble in water (monohydrate) and in glycerin (heptahydrate); practically insoluble in alcohol (monohydrate); insoluble in alcohol (heptahydrate).

Zinc Undecylenate: Fine, white powder. Practically insoluble in water and in alcohol.

Ziprasidone Hydrochloride: White to slightly pink powder. Very soluble in methanol; slightly soluble in isopropyl alcohol, and in hot tetrahydrofuran; practically insoluble in water.

Zolazepam Hydrochloride: White to off-white, crystalline powder. Freely soluble in water and in 0.1 N hydrochloric acid; soluble in methanol; slightly soluble in chloroform; practically insoluble in ether.

Zolpidem Tartrate: White to off-white powder, hygroscopic. Sparingly soluble in methanol; slightly soluble in water; practically insoluble in methylene chloride.

Zonisamide: White to off-white powder. Freely soluble in dimethylformamide; soluble in methanol.

SOLUBILITIES

Approximate Solubilities of USP and NF Articles

Solute (1 g)	Name and Volume, in mL, of Solvent

ATOMIC WEIGHTS

Standard Atomic Weights of the Elements, Recommended by the Commission on Atomic Weights and Isotopic Abundances of the International Union of Pure and Applied Chemistry (2007) (©2008 IUPAC)

Standard atomic weights 2007 [In alphabetical order: scaled to $A_r(12\text{C}) = 12$, where ^{12}C is a neutral atom in its nuclear and electronic ground state.]

The atomic weights of many elements are not invariant but depend on the origin and treatment of the material. The standard values of $A_r(\text{E})$ and the uncertainties (in parentheses, following the last significant figure to which they are attributed) apply to elements of natural terrestrial origin. The footnotes to this Table elaborate the types of variation which may occur for individual elements and which may be larger than the listed uncertainties of values of $A_r(\text{E})$. Names of elements with atomic numbers 112, 113, 114, 115, 116, and 118 are temporary.

Name	Atomic Symbol	Atomic Number	Atomic Weight	Footnotes

Hafnium	Hf	72	178.49(2)	

*Element has no stable nuclides. One or more well-known isotopes are given in the accompanying table with the appropriate relative atomic mass and half-life. However, three such elements (Th, Pa, and U) do have a characteristic terrestrial isotopic composition, and for these an atomic weight is tabulated.

†Commercially available Li materials have atomic weights that are known to range between 6.939 and 6.996; if a more accurate value is required, it must be determined for the specific material.

‡Geological specimens are known in which the element has an isotopic composition outside the limits for normal material. The difference between the atomic weight of the element in such specimens and that given in the Table may exceed the stated uncertainty.

§Modified isotopic compositions may be found in commercially available material because it has been subjected to an undisclosed or inadvertent isotopic fractionation. Substantial deviations in atomic weight of the element from that given in the Table can occur.

¶Range in isotopic composition of normal terrestrial material prevents a more precise $A_r(\text{E})$ being given; the tabulated $A_r(\text{E})$ value should be applicable to any normal material.

*Element has no stable nuclides. One or more well-known isotopes are given in the accompanying table with the appropriate relative atomic mass and half-life. However, three such elements (Th, Pa, and U) do have a characteristic terrestrial isotopic composition, and for these an atomic weight is tabulated.

[†]Commercially available Li materials have atomic weights that are known to range between 6.939 and 6.996; if a more accurate value is required, it must be determined for the specific material.

[‡]Geological specimens are known in which the element has an isotopic composition outside the limits for normal material. The difference between the atomic weight of the element in such specimens and that given in the *Table* may exceed the stated uncertainty.

[§]Modified isotopic compositions may be found in commercially available material because it has been subjected to an undisclosed or inadvertent isotopic fractionation. Substantial deviations in atomic weight of the element from that given in the *Table* can occur.

^{||}Range in isotopic composition of normal terrestrial material prevents a more precise Ar(E) being given; the tabulated Ar(E) value should be applicable to any normal material.

N-Acetyltyrosine

$C_{11}H_{13}NO_4$ 223.2
N-Acetyl-L-tyrosine;
 (2*S*)-2-(Acetylamino)-3-(4-hydroxyphenyl)propanoic acid
 [537-55-3].

DEFINITION

N-Acetyltyrosine contains NLT 98.5% and NMT 101.0% of $C_{11}H_{13}NO_4$, as *N*-acetyl-L-tyrosine, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. OPTICAL ROTATION**, *Specific Rotation* (781S)
Sample solution: 10 mg/mL
Acceptance criteria: NLT +46.0° and NMT +49.0°, determined at 20°
- **C.** The R_f value of the principal spot of the *Sample solution* in the test for *Organic Impurities* corresponds to that of *Standard solution 1*.

ASSAY

PROCEDURE

Sample solution: Dissolve about 180 mg of *N*-Acetyltyrosine, weighed, in 50 mL of carbon dioxide-free water.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Equivalency: Each mL of 0.1 N sodium hydroxide VS is equivalent to 22.32 mg of $C_{11}H_{13}NO_4$.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **CHLORIDE AND SULFATE**, *Chloride* (221): NMT 200 ppm. A 0.7-g portion shows no more chloride than corresponds to 0.40 mL of 0.01 N hydrochloric acid.
- **CHLORIDE AND SULFATE**, *Sulfate* (221): NMT 200 ppm. A 1.2-g portion shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid.
- **IRON** (241): NMT 20 ppm
- **HEAVY METALS**, *Method 1* (231): NMT 10 ppm

Organic Impurities

PROCEDURE

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Standard stock solution 1: 8 mg/mL of USP *N*-Acetyl-L-tyrosine RS in a mixture of water, glacial acetic acid, and alcohol (3:3:94)

Standard solution 1: Dilute *Standard stock solution 1* with alcohol to obtain a solution having a known concentration of about 0.4 mg/mL.

Standard solution 2: 0.8 mg/mL of USP L-Tyrosine RS dissolved in a mixture of glacial acetic acid and water (1:1), and diluted with alcohol

Sample solution: Transfer 0.8 g of *N*-Acetyltyrosine to a 10-mL volumetric flask, dissolve in 6 mL of a mixture of glacial acetic acid and water (1:1), and dilute with alcohol to volume.

Application volume: 5 μ L

Developing solvent system: A mixture of ammonia and 2-propanol (3:7)

Spray reagent: Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butanol and 2 N acetic acid (95:5).

Analysis: Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*. After air-drying the plate, repeat the development process. After air-drying a second time, spray with *Spray reagent*, and heat between 100° and 105° for about 15 min.

Acceptance criteria: Any secondary spot from the *Sample solution* is not larger or more intense than the principal spot from *Standard solution 1*, except for the spot corresponding to tyrosine, which is not larger or more intense than the principal spot from *Standard solution 2*.

Individual impurities: NMT 0.5%

Limit of tyrosine: NMT 1.0%

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.1% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
 USP *N*-Acetyl-L-tyrosine RS
 USP L-Tyrosine RS

Alpha Lipoic Acid—see *Alpha Lipoic Acid under L*.

Alanine—see *Alanine General Monographs*

American Ginseng

DEFINITION

American Ginseng consists of the dried roots of *Panax quinquefolius* L. (Fam. Araliaceae). It contains NLT 4.0% of total ginsenosides, calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 20 mg/mL of USP Powdered American Ginseng Extract RS in methanol

Standard solution B: 20 mg/mL of USP Powdered Asian Ginseng Extract RS in methanol

Sample solution: Transfer about 1.0 g of finely powdered American Ginseng to a 25-mL flask fitted with a reflux condenser. Add 10.0 mL of a mixture of methanol and water (7:13), and heat under reflux for 15 min. Cool, filter, and dilute the filtrate with methanol to 10.0 mL.

Adsorbent: 0.25-mm layer of silica gel, typically 20 cm long (TLC plates)

Application volume: 20 μ L

Developing solvent system A: Chloroform, methanol, and water (13:7:2). Use the lower phase.

Developing solvent system B: Butyl alcohol, ethyl acetate, and water (4:1:5). Use the upper phase.

Spray reagent: Dissolve 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid, add 85 mL of methanol, mix, and carefully add 5 mL of sulfuric acid.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop in a chamber containing *Developing solvent system A* until the solvent front has moved 10.5 cm from the origin. Remove the plates, and allow to dry. Turn the plates 90°, and develop in a chamber containing *Developing solvent system B* until the solvent front has moved 10.5 cm from the origin. Remove the plates, and allow to dry. Spray with *Spray reagent*. Heat the plates at 105°–110° for 10 min, and examine.

Suitability requirements: The order, from top to bottom, of ginsenosides on the chromatographic plates is: Rg₂ (on left) and Rg₁ (on right), Rf, Re, Rd, Rc, Rb₂ (on left) and Rb₁ (on right), and Ro. Ginsenosides Rg₂, Rg₁, Rf, Re, and Rd are found on the upper half of the plates; the remaining ginsenosides are found on the lower half after chromatographing with *Developing solvent system B*. *Standard solution A* does not exhibit a spot for ginsenoside Rf. *Standard solution B* exhibits a spot for ginsenoside Rf.

Acceptance criteria: The spots from the *Sample solution* correspond to those from *Standard solution A*.

- **B.** The retention times of the peaks for ginsenosides Rg₁, Re, Rb₁, Rb₂, Rc₂, and Rd of the *Sample solution* correspond to those of *Standard solution A*, as obtained in the test for *Content of Ginsenosides*. The ratio of the peak responses for ginsenosides Rb₂ to Rb₁ is less than 0.4, and the ratio of the peak responses for ginsenosides Rg₁ to Rb₁ is less than 0.3. The chromatogram shows no significant peak at the retention time corresponding to that for ginsenoside Rf of *Standard solution B*, as obtained in the test for *Content of Ginsenosides*.

COMPOSITION

• CONTENT OF GINSENOSES

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	76	24
12	76	24
28	65	35
51.5	56.5	43.5
52.5	0	100
64.5	76	24
77	76	24

Diluent: Alcohol and water (4:6)

Standard solution A: Transfer a quantity of USP Powdered American Ginseng Extract RS, equivalent to about 2 mg of ginsenoside Rb₁, to a suitable container, and dissolve in 10.0 mL of *Diluent*.

Standard solution B: Transfer a quantity of USP Powdered Asian Ginseng Extract RS, equivalent to about 2 mg of ginsenoside Rg₁, to a suitable container, and dissolve in 10.0 mL of *Diluent*.

Sample solution: Reduce 100 g of American Ginseng to a powder, and transfer about 1.0 g of the powder, accurately weighed, to a 100-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of *Diluent* and a few grains of pumice, boil on a water bath under reflux for 1 h, cool, and filter. Wash the flask and the residue with 20 mL of *Diluent*, and pass through the same filter. Combine the filtrates, and evaporate in a rotary evaporator at 50° to dryness. Dissolve the residue in 10.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Analytical column: 4.6-mm \times 15-cm; 3- μ m packing L1

Guard column: 4.6-mm \times 2.0-cm; packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the 6 major ginsenosides, in replicate injections

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd in the *Standard solutions* and the *Sample solution* by comparing the chromatograms with the Reference Chromatogram provided with USP Powdered American Ginseng Extract RS, and measure the peak responses.

Calculate the percentages of individual ginsenosides in the portion of American Ginseng taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response of ginsenoside Rg₁, Re, Rb₁, Rc, Rb₂, or Rd from the *Sample solution*

- r_s = peak response of ginsenoside Rg₁, Re, Rb₁, Rc, Rb₂, or Rd from the appropriate *Standard solution*
- C_s = concentration of ginsenoside Rg₁, Re, Rb₁, Rc, Rb₂, or Rd in the appropriate *Standard solution* (mg/mL)
- V = volume of the *Sample solution* (mL)
- W = weight of American Ginseng taken to prepare the *Sample solution* (mg)

Calculate the percentage of total ginsenosides in the portion of American Ginseng taken by adding the individual percentages.

Acceptance criteria: NLT 4.0% of total ginsenosides on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 100 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Fusiform or cylindrical roots, sometimes branched, typically 1–10 cm, sometimes up to 20 cm, in length and up to 2.5 cm in diameter at the crown, with one or more stem scars. Externally pale yellow to golden, rough-textured, with prominent horizontal rings and fine longitudinal ridges as a result of drying. Root scars or fine rootlets are present. If stem base is present, scales are thin and perishing (differs from *P. ginseng*, in which scales at base of stem are fleshy and persistent). Fracture is short; fractured surface is white to ivory, with distinct aromatic odor and rings of secretory canals present in secondary phloem.

Histology

Transverse section of root: Multiple layers of thin-walled cork cells are present. Secondary phloem is characterized by conspicuous air lacunae; abundant, starch-containing storage parenchyma; few sieve elements, found in small groupings; and rings of schizogenous secretory canals. Each secretory canal is lined with 6–8 epithelial cells that lack starch. Xylem is characterized by abundant starch-containing storage parenchyma and a few tracheary elements, composed of nonlignified tracheids and slightly lignified spiral or reticulated vessels lacking secretory canals and found in isolation or in small groupings. Druse crystals are sometimes present within vascular parenchyma cells. Diarch or triarch primary xylem is in center of root.

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 2.0%
- **LOSS ON DRYING** (731): Dry 1 g of it, finely powdered, at 105° for 2 h: it loses NMT 10.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 8%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store protected from heat.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

• USP REFERENCE STANDARDS (11)

USP Powdered American Ginseng Extract RS
USP Powdered Asian Ginseng Extract RS

Powdered American Ginseng

DEFINITION

Powdered American Ginseng is American Ginseng reduced to a fine or a very fine powder. It contains NLT 4.0% of total ginsenosides, calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 20 mg/mL of USP Powdered American Ginseng Extract RS in methanol

Standard solution B: 20 mg/mL of USP Powdered Asian Ginseng Extract RS in methanol

Sample solution: Transfer about 1.0 g of Powdered American Ginseng to a 25-mL flask fitted with a reflux condenser. Add 10.0 mL of a mixture of methanol and water (7:13), and heat under reflux for 15 min. Cool, filter, and dilute the filtrate with methanol to 10.0 mL.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 20 µL

Developing solvent system A: Chloroform, methanol, and water (13:7:2). Use the lower phase.

Developing solvent system B: Butyl alcohol, ethyl acetate, and water (4:1:5). Use the upper phase.

Spray reagent: Dissolve 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid, add 85 mL of methanol, mix, and carefully add 5 mL of sulfuric acid.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop in a chamber containing *Developing solvent system A* until the solvent front has moved 10.5 cm from the origin. Remove the plates, and allow to dry. Turn the plates 90°, and develop in a chamber containing *Developing solvent system B* until the solvent front has moved 10.5 cm from the origin. Remove the plates, and allow to dry. Spray with *Spray reagent*. Heat the plates at 105°–110° for 10 min, and examine.

Suitability requirements: The order, from top to bottom, of ginsenosides on the chromatographic plates is: Rg₂ (on left) and Rg₁ (on right), Rf, Re, Rd, Rc, Rb₂ (on left) and Rb₁ (on right), and Ro. Ginsenosides Rg₂, Rg₁, Rf, Re, and Rd are found on the upper half of the plates; the remaining ginsenosides are found on the lower half after chromatographing with *Developing solvent system B*. *Standard solution A* does not exhibit a spot for ginsenoside Rf. *Standard solution B* exhibits a spot for ginsenoside Rf.

Acceptance criteria: The spots from the *Sample solution* correspond to those from *Standard solution A*.

- **B.** The retention times of the peaks for ginsenosides Rg₁, Re, Rb₁, Rb₂, Rc₂, and Rd of the *Sample solution* correspond to those of *Standard solution A*, as obtained in the test for *Content of Ginsenosides*. The ratio of the peak responses for ginsenosides Rb₂ to Rb₁ is less than 0.4, and the ratio of the peak responses for ginsenosides Rg₁ to Rb₁ is less than 0.3. The chromatogram shows no significant peak at the retention time corresponding to that for ginsenoside Rf of *Standard solution B*, as obtained in the test for *Content of Ginsenosides*.

Diluent: Alcohol and water (4:6)

Standard solution A: Transfer a quantity of USP Powdered American Ginseng Extract RS, equivalent to about 2 mg of ginsenoside Rb₁, to a suitable container, and dissolve in 10.0 mL of *Diluent*.

Standard solution B: Transfer a quantity of USP Powdered Asian Ginseng Extract RS, equivalent to about 2 mg of ginsenoside Rg₁, to a suitable container, and dissolve in 10.0 mL of *Diluent*.

Sample solution: Transfer a quantity of Powdered American Ginseng Extract, equivalent to about 5 mg of ginsenosides, to a suitable container. Dissolve in 10.0 mL of *Diluent*, sonicating for 10 min, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Analytical column: 4.6-mm × 15-cm; 3-μm packing L1

Guard column: 4.6-mm × 2.0-cm; packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the 6 major ginsenosides, in replicate injections

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd in the *Standard solutions* and the *Sample solution* by comparing the chromatograms with the Reference Chromatogram provided with USP Powdered American Ginseng Extract RS, and measure the peak responses.

Calculate the percentages of individual ginsenosides in the portion of Powdered American Ginseng Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, or Rd from the *Sample solution*

r_S = peak response of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, or Rd from the appropriate *Standard solution*

C_S = concentration of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, or Rd in the appropriate *Standard solution* (mg/mL)

C_U = concentration of Powdered American Ginseng Extract in the *Sample solution* (mg/mL)

P = labeled amount, in percentage, of each relevant ginsenoside in USP Powdered American Ginseng Extract RS

Calculate the percentage of total ginsenosides in the portion of Powdered American Ginseng Extract taken by adding the individual percentages.

Acceptance criteria: NLT 10.0% of total ginsenosides on the anhydrous basis

CONTAMINANTS

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 10³ cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* <921>: NMT 7.0%
- **BOTANICAL EXTRACTS**, *Residue on Evaporation* (565): Meets the requirements
- **ALCOHOL DETERMINATION**, *Method II* <611>: NMT 0.25%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. Label it to indicate the content of total ginsenosides, the extracting solvent used for preparation, and the ratio of the starting crude plant material to the Powdered Extract. It meets the labeling requirements under *Botanical Extracts* (565).

American Ginseng Capsules

DEFINITION

American Ginseng Capsules contain Powdered American Ginseng Extract. Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of Extract, calculated as the sum of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Sample solution

Soft-shell gelatin Capsules: Transfer a portion of the contents of the Capsules, equivalent to 100 mg of Powdered Extract, to a separatory funnel containing 30 mL of a mixture of hexanes, methanol, and water (20:15:10), dissolve in this mixture, and collect the lower layer. Wash the upper layer with three 15-mL portions of a mixture of methanol and water (15:10), and combine the washings with the lower layer. Evaporate to dryness under vacuum at 45°–50°. Dissolve the residue in 5 mL of methanol.

Hard-shell gelatin Capsules: Transfer a portion of the contents of the Capsules, equivalent to 100 mg of Powdered Extract, to a conical flask. Extract at 55° with three 20-mL portions of a mixture of methanol and water (2:8). Evaporate the combined extracts to dryness under vacuum at 45°–50°. Dissolve the residue in 5 mL of methanol.

Standard solution A: 20 mg/mL of USP Powdered American Ginseng Extract RS in methanol

Standard solution B: 20 mg/mL of USP Powdered Asian Ginseng Extract RS in methanol

Application volume: 20 µL

Developing solvent system A: The lower phase of a mixture of chloroform, methanol, and water (13:7:2)

Developing solvent system B: The upper phase of a mixture of butyl alcohol, ethyl acetate, and water (4:1:5)

Spray reagent: Dissolve 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid, add 85 mL of methanol, mix, carefully add 5 mL of sulfuric acid, and mix.

Analysis

Samples: *Sample solution*, *Standard solution A*, and *Standard solution B*

Develop the chromatograms in a chamber containing *Developing solvent system A* until the solvent front has moved 10.5 cm from the origin. Remove the plate from the chamber, and allow to dry. Turn the plate 90°, and develop in a chamber containing *Developing solvent system B* until the solvent front has moved 10.5 cm from the origin. Remove the plate from the chamber, and allow to dry. Spray with *Spray reagent*. Heat the plate at 105°–110° for 10 min, and examine. The order, from top to bottom, of ginsenosides on the plates is Rg₂ (on left) and Rg₁ (on right), Rf, Re, Rd, Rc, Rb₂ (on left) and Rb₁ (on right), and Ro.

Ginsenosides Rg₂, Rg₁, Rf, Re, and Rd are found on the upper half of the plates; the remaining ginsenosides are found on the lower half after chromatographing with *Developing solvent system B*.

Acceptance criteria: *Standard solution A* does not exhibit a spot for ginsenoside Rf. *Standard solution B* exhibits a spot for ginsenoside Rf. The spots from the *Sample solution* correspond to those from *Standard solution A*.

- **B.** The retention times of the peaks for ginsenosides Rg₁, Re, Rb₁, Rb₂, Rc, and Rd in the chromatogram of the

Sample solution correspond to those from the *Standard solution*, as obtained in the test for *Content of Ginsenosides*. The ratio of the peak response for Rb₂ to the peak response for Rb₁ is less than 0.4; and the ratio of the peak response for Rg₁ to the peak response for Rb₁ is less than 0.3. There is no significant peak at the retention time corresponding to that of ginsenoside Rf in the *System suitability solution*, as obtained in the test for *Content of Ginsenosides*.

STRENGTH

- **CONTENT OF GINSENOSES**

Method 1

Diluent: Water and alcohol (3:2)

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	76	24
12	76	24
28	65	35
51.5	56.5	43.5
52.5	0	100
64.5	76	24
77	76	24

Standard solution: A solution of USP Powdered American Ginseng Extract RS in *Diluent* containing the equivalent of 0.2 mg/mL of ginsenoside Rb₁

Sample solution (soft-gelatin Capsules): Open NLT 20 Capsules, transfer the contents to a suitable container, and mix to homogenize. Transfer a portion, expected to contain an amount of Extract equivalent to 12 mg of ginsenosides, to a suitable flask with a stopper. Add 5.0 mL of tetrahydrofuran, and sonicate for 5 min. Add 25.0 mL of a mixture of methanol and water (4:6), and shake for 50 min in an automatic shaker. Transfer 15.0 mL of the obtained emulsion to a centrifuge tube with a stopper, add 800 mg of sodium chloride, shake for 30 s, and centrifuge to obtain a clear upper phase. Dilute 1.0 mL of the upper phase with 4 mL of water in a suitable tube, and transfer the solution to a column containing 360 mg of packing L2 that has been previously treated with 3.0 mL of methanol followed by 8.0 mL of water. [NOTE—Elute slowly, not faster than 1 drop/s, in all elution steps. Do not use vacuum.] Rinse the tube with 5 mL of water, transfer to the column taking the precaution of slow elution, and discard the eluate. Repeat the elution with 5 mL of a mixture of methanol and water (4:6), and discard the eluate. Elute the ginsenosides with 5.0 mL of methanol. Evaporate the solution under a stream of nitrogen at 40° (50 min), and dissolve the residue with 1.0 mL of a solution of acetonitrile and water (1:4).

System suitability solution: 24 mg/mL of USP Powdered Asian Ginseng Extract RS in *Diluent*. Filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column

Guard column: 4.6-mm × 2.0-cm; packing L1

Analytical column: 4.6-mm × 15-cm; 3-µm packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution* (inject 20 µL)

Suitability requirements

Chromatogram similarity: The *System suitability solution* chromatogram is similar to the Reference Chro-

matogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the six major ginsenosides, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Identify ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd in the *Standard solution* and the *Sample solution* by comparing the chromatograms with the Reference Chromatogram provided with USP Powdered American Ginseng Extract RS being used, and measure the peak responses.

Calculate the quantity, in mg, of each relevant ginsenoside (Rg₁, Re, Rb₁, Rc, Rb₂, and Rd) in the portion of Capsule contents taken:

$$\text{Result} = 0.3 \times (r_U/r_S) \times C_S \times P$$

r_U = peak area for each relevant ginsenoside from the *Sample solution*

r_S = peak area for each relevant ginsenoside from the *Standard solution*

C_S = concentration of USP Powdered American Ginseng Extract RS in the *Standard solution* (mg/mL)

P = labeled amount, in percentage, of each relevant ginsenoside in the USP Powdered American Ginseng Extract RS lot being used

Calculate the content of total ginsenosides, T, in mg, by adding the amounts of individual ginsenoside.

Calculate the percentage of Powdered Extract with respect to the label claim:

$$\text{Result} = T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

T = content of total ginsenosides in the portion of Capsule contents taken (mg)

A_{WT} = average weight of Capsule contents (mg/Capsule)

W = weight of the portion of Capsule contents taken (mg)

L_E = content of total ginsenosides, mg, in 100 mg of the Extract used to prepare the Capsules

L = amount of Extract per Capsule according to label claim (mg/Capsule)

Method 2

Diluent, Solution A, Solution B, Mobile phase, System suitability solution, Chromatographic system, and Suitability requirements: Proceed as directed under *Method 1*.

Solvent A: Upper phase of a mixture consisting of hexane, methanol, and water (4:3:2)

Solvent B: Lower phase of a mixture consisting of hexane, methanol, and water (4:3:2)

Standard solution: A solution of USP Powdered American Ginseng Extract RS in *Diluent* containing the equivalent of 1 mg/mL of ginsenoside Rb₁

Sample solution A (for soft-gelatin Capsules): Open NLT 20 Capsules and transfer the contents to a suitable container. Mix to homogenize and transfer a portion, expected to contain an amount of Extract equivalent to 15 mg of total ginsenosides, to a 50-mL flask. Add 10.0 mL of *Solvent A*, and sonicate for 3–5 min at 25°–30°. Transfer the solution to a 125-mL separatory funnel. To the residue add 10 mL of *Solvent B*, and sonicate for 3–5 min at 25°–30°. Transfer the solution to the same separatory funnel. Repeat the above procedure twice (the total volume will be about 60 mL). Shake, and then allow the phases to separate. Collect the combined lower phase in a round-bottom flask, and wash the combined upper phase twice with 10 mL of *Solvent B*. Evaporate the combined lower phase to dryness under vacuum at 45°–50°. Transfer the residue to a 10-mL volumetric flask using small

volumes of methanol, and dilute with methanol to volume.

Sample solution B (for hard-gelatin Capsules): Weigh the contents of NLT 20 Capsules, and composite the contents. Transfer a portion of the composite, expected to contain an amount of Extract equivalent to 15 mg of total ginsenosides, to a conical flask. Add 15 mL of methanol, and shake to mix. Sonicate the mixture at 25°–30° for 30 min. Cool, pass through filter paper, and return the residue to the conical flask. Add another 15 mL of methanol, sonicate the mixture at 25°–30° for 30 min, and filter. Wash the residue with three 15-mL portions of methanol. Evaporate the combined extracts and washing to dryness under vacuum at 45°–50°. Transfer the residue to a 10-mL volumetric flask using small volumes of methanol, and dilute with methanol to volume.

Analysis

Samples: *Standard solution* and *Sample solution*

Identify ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd in the *Standard solution* and the *Sample solution* by comparing the chromatograms with the Reference Chromatogram provided with USP Powdered American Ginseng Extract RS, and measure the peak responses.

Calculate the quantity, in mg, of each relevant ginsenoside (Rg₁, Re, Rb₁, Rc, Rb₂, and Rd) in the portion of Capsule contents taken:

$$\text{Result} = 0.1 \times (r_U/r_S) \times C_S \times P$$

r_U = peak area for each relevant ginsenoside from the *Sample solution*

r_S = peak area for each relevant ginsenoside from the *Standard solution*

C_S = concentration of USP Powdered American Ginseng Extract RS in the *Standard solution* (mg/mL)

P = labeled amount, in percentage, of each relevant ginsenoside in the USP Powdered American Ginseng Extract RS lot being used

Calculate the content of total ginsenosides, T, in mg, by adding the amounts of individual ginsenoside.

Calculate the percentage of Powdered Extract with respect to the label claim:

$$\text{Result} = T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

T = content of total ginsenosides in the portion of Capsule contents taken (mg)

A_{WT} = average weight of Capsule contents (mg/Capsule)

W = weight of the portion of Capsule contents taken (mg)

L_E = content of total ginsenosides, mg, in 100 mg of the Extract used to prepare the Capsules

L = amount of Extract per Capsule according to label claim (mg/Capsule)

Acceptance criteria: 90.0%–110.0% of Extract, calculated as the sum of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS

(2040): Meet the requirements for *Disintegration*

• WEIGHT VARIATION OF DIETARY SUPPLEMENTS (2091):

Meet the requirements

CONTAMINANTS

• MICROBIAL ENUMERATION TESTS (2021):

The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 10³ cfu/g.

• ABSENCE OF SPECIFIED MICROORGANISMS (2022):

Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the amount of Extract, in mg/Capsule. Label the Capsules to indicate the percentage of ginsenosides in the Extract contained in the Capsules. For soft-gelatin Capsules, state the method for *Content of Ginsenosides* with which the product complies only if *Method 1* is not used.
- **USP REFERENCE STANDARDS** (11)
 - USP Powdered American Ginseng Extract RS
 - USP Powdered Asian Ginseng Extract RS

American Ginseng Tablets

DEFINITION

American Ginseng Tablets contain Powdered American Ginseng Extract. Tablets contain NLT 90.0% and NMT 110.0% of Extract, calculated as the sum of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Standard solution A: 20 mg/mL of USP Powdered American Ginseng Extract RS in methanol

Standard solution B: 20 mg/mL of USP Powdered Asian Ginseng Extract RS in methanol

Sample solution: Transfer a quantity of finely powdered Tablets, equivalent to 100 mg of Extract, to a conical flask. Extract at 55° with three 20-mL portions of a mixture of methanol and water (2:8). Evaporate the combined extracts to dryness under vacuum at 45°–50°. Dissolve the residue in 5 mL of methanol.

Application volume: 20 µL

Developing solvent system A: The lower phase of a mixture of chloroform, methanol, and water (13:7:2)

Developing solvent system B: The upper phase of a mixture of butyl alcohol, ethyl acetate, and water (4:1:5)

Spray reagent: Dissolve 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid, add 85 mL of methanol, mix, carefully add 5 mL of sulfuric acid, and mix.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed in the chapter. Develop in a chamber containing *Developing solvent system A* until the solvent front has moved 10.5 cm from the origin. Remove the plates from the chamber, and allow to dry. Turn the plates 90°, and develop in a chamber containing *Developing solvent system B* until the solvent front has moved 10.5 cm from the origin. Remove the plates from the chamber, and allow to dry. Spray with *Spray reagent*. Heat the plates at 105°–110° for 10 min, and examine. The order, from top to bottom, of ginsenosides on the plates is Rg₂ (on left) and Rg₁ (on right), Rf, Re, Rd, Rc, Rb₂ (on left) and Rb₁ (on right), and Ro. Ginsenosides Rg₂, Rg₁, Rf, Re, and Rd are found on the upper half of the plates; the remaining ginsenosides are found on the lower half after chromatographing with *Developing solvent system B*.

Acceptance criteria: The chromatogram of *Standard solution A* does not exhibit a spot for ginsenoside Rf. *Standard solution B* exhibits a spot for ginsenoside Rf. The spots from the *Sample solution* correspond to those from *Standard solution A*.

- **B.** The retention times of the peaks for ginsenosides Rg₁, Re, Rb₁, Rb₂, Rc₂, and Rd in the chromatogram of the

Sample solution correspond to those from the *Standard solution*, as obtained in the test for *Content of Ginsenosides*. The ratio of the peak response for Rb₂ to the peak response for Rb₁ is less than 0.4; and the ratio of the peak response for Rg₁ to the peak response for Rb₁ is less than 0.3. The *Sample solution* chromatogram shows no significant peak at the retention time corresponding to that of ginsenoside Rf in the *System suitability solution*, as obtained in the test for *Content of Ginsenosides*.

STRENGTH

- **CONTENT OF GINSENOSES**

Diluent: Water and alcohol (3:2)

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	76	24
12	76	24
28	65	35
51.5	56.5	43.5
52.5	0	100
64.5	76	24
77	76	24

Standard solution: A solution of USP Powdered American Ginseng Extract RS in *Diluent* containing the equivalent of 1 mg/mL of ginsenoside Rb₁

Sample solution: Accurately weigh and finely powder NLT 20 Tablets. Transfer to a conical flask an accurately weighed portion of the powder expected to contain an amount of Extract equivalent to 15 mg of total ginsenosides, add 15 mL of methanol, and shake to mix. Sonicate the mixture at 25°–30° for 30 min. Cool, pass through filter paper, and return the residue to the conical flask. Add another 15 mL of methanol, sonicate the mixture at 25°–30° for 30 min, and filter. Wash the residue with three 15-mL portions of methanol. Evaporate the combined extracts and washings to dryness under vacuum at 45°–50°. Transfer the residue to a 10.0-mL volumetric flask, using small volumes of methanol, and dilute with methanol to volume.

System suitability solution: 24 mg/mL of USP Powdered Asian Ginseng Extract RS in *Diluent*. Filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column

Guard column: 4.6-mm × 2.0-cm; packing L1

Analytical column: 4.6-mm × 15-cm; 3-µm packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution* (inject 20 µL)

Suitability requirements

Chromatogram similarity: The *System suitability solution* chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the six major ginsenosides, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*
Identify ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd in the *Standard solution* and *Sample solution* by comparing the chromatograms with the Reference Chromatogram provided with USP Powdered American Ginseng

Extract RS lot being used, and measure the peak responses.

Calculate the quantity, in mg, of each relevant ginsenoside (Rg₁, Re, Rb₁, Rc, Rb₂, and Rd) in the portion of Tablets taken:

$$\text{Result} = 0.1 \times (r_U/r_S) \times C_S \times P$$

- r_U = peak area for each relevant ginsenoside from the *Sample solution*
 r_S = peak area for each relevant ginsenoside from the *Standard solution*
 C_S = concentration of USP Powdered American Ginseng Extract RS in the *Standard solution* (mg/mL)
 P = labeled amount, in percentage, of each relevant ginsenoside in the USP Powdered American Ginseng Extract RS lot being used
 Calculate the content of total ginsenosides, T , in mg, by adding the amounts of individual ginsenoside.
 Calculate the percentage of Powdered Extract with respect to the label claim:

$$\text{Result} = T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

- T = content of total ginsenosides in the portion of Tablets taken (mg)
 A_{WT} = average weight of Tablets (mg/Tablet)
 W = weight of the portion of Tablets taken (mg)
 L_E = content of total ginsenosides, mg, in 100 mg of the Extract used to prepare the Tablets
 L = amount of Extract per Tablet according to label claim (mg/Tablet)
Acceptance criteria: 90.0%–110.0% of Powdered Extract, calculated as the sum of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS <2040>:** Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:** Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS <2021>:** The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 10³ cfu/g. Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. The label also indicates the amount of Extract, in mg/Tablet. Label the Tablets to indicate the percentage of total ginsenosides in the Extract contained in the Tablets.
- **USP REFERENCE STANDARDS <11>**
 USP Powdered American Ginseng Extract RS
 USP Powdered Asian Ginseng Extract RS

Asian Ginseng

DEFINITION

Asian Ginseng consists of the dried roots of *Panax ginseng* C.A. Mey. (Fam. Araliaceae). It contains NLT 0.2% of ginsenoside Rg₁ and NLT 0.1% of ginsenoside Rb₁, both calculated on the dried basis.

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 5 mg/mL each of arbutin and escin, in methanol

Sample solution: 1.0 g of finely powdered Asian Ginseng in a 25-mL flask fitted with a reflux condenser. Add 10.0 mL of a mixture of methanol and water (7:3), and heat under reflux for 15 min. Cool, filter, and dilute the filtrate with methanol to 10.0 mL.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 20 µL, as bands

Developing solvent system: The upper layer of a mixture of butyl alcohol, ethyl acetate, and water (10:2.5:5) in an unsaturated chamber

Spray reagent: Dissolve 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid, add 85 mL of methanol, mix, and carefully add 5 mL of sulfuric acid, and mix.

Analysis

Samples: *Standard solution* and *Sample solution*
 Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to dry. Spray with *Spray reagent*. Heat the plate at 105°–110° for 10 min, and examine the plate.

System suitability: The *Standard solution* chromatogram shows, in the upper third, a brown zone corresponding to arbutin, and in the lower third, a gray zone corresponding to escin.

Acceptance criteria: The *Sample solution* exhibits violet-gray zones corresponding to ginsenoside Rg₁ in the upper portion and to ginsenoside Re in the middle and in between the zones corresponding to arbutin and escin in the *Standard solution*. A violet-gray zone corresponding to ginsenoside Rb₁ is located at the same R_F value as the gray zone corresponding to escin in the *Standard solution*. Other, less intense bands may be observed between the zones due to ginsenosides Rb₁ and Re, and the zone closest to the origin corresponds to ginsenoside Rc. Other spots may be visible in the lower third of the chromatogram.

- **B.** The retention times of the peaks for ginsenosides Rg₁, Re, Rf, Rb₁, Rc, and Rd in the *Sample solution* chromatogram correspond to those in the *Standard solution*, as obtained in the test for *Content of Ginsenosides Rb₁ and Rg₁*. The ratio of the peak area for ginsenoside Rb₂ to the peak area for ginsenoside Rb₁ is NLT 0.4 (differentiation from American Ginseng).

COMPOSITION

CONTENT OF GINSENOIDES Rb₁ AND Rg₁

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	76	24
12	76	24
28	65	35
51.5	56.5	43.5
52.5	0	100
64.5	76	24
77	76	24

Diluent: Alcohol and water (4:6)

Standard solution: Transfer a quantity of USP Powdered Asian Ginseng Extract RS, equivalent to 2 mg of ginsenoside Rg₁, to a suitable container, and dissolve in 10.0 mL of *Diluent*. [NOTE—The concentrations of ginsenoside Rg₁ and ginsenoside Rb₁ in this solution are not

expected to be equal and are determined on the basis of the labeled quantities present in USP Powdered Asian Ginseng Extract RS.]

Sample solution: Reduce 100 g of Asian Ginseng to a powder, and transfer about 1.0 g of the powder, accurately weighed, to a 100-mL, round-bottom flask fitted with a reflux condenser. Add 50 mL of *Diluent* and a few grains of pumice, and boil on a water bath under reflux for 1 h. Cool, and filter. Wash the flask and the residue with 20 mL of *Diluent*, and pass through the same filter. Combine the filtrates, and evaporate in a rotary evaporator at 50° to dryness. Dissolve the residue in 10.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Analytical column: 4.6-mm × 15-cm; 3-μm packing L1

Guard column: 4.6-mm × 2.0-cm; packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the 6 major ginsenosides, in replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of ginsenosides Rb₁ and Rg₁ in the portion of Asian Ginseng taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response of ginsenoside Rg₁ or ginsenoside Rb₁ from the *Sample solution*

r_S = peak response of ginsenoside Rg₁ or ginsenoside Rb₁ from the *Standard solution*

C_S = concentration of ginsenoside Rg₁ or ginsenoside Rb₁ in the *Standard solution* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Asian Ginseng taken to prepare the *Sample solution* (mg)

Acceptance criteria

Ginsenoside Rg₁: NLT 0.2% on the dried basis

Ginsenoside Rb₁: NLT 0.1% on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Methods for Pesticide Residues Analysis* <561>: Meets the requirements
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 100 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: Fusiform or cylindrical roots, with distinct aromatic odor, sometimes branched, typically 1–10 cm,

sometimes up to 20 cm in length and up to 2.5 cm in diameter at the crown, with one or more stem scars. Externally pale yellow to golden, rough textured in the lower part, with prominent horizontal rings and fine longitudinal ridges as a result of drying. Root scars or fine rootlets are present. Fractures are short, with the fractured surface, white to ivory, exposing a ring of secretory canals present in secondary phloem.

Histology

Transverse section of root: Multiple layers of thin-walled cork cells present. Secondary phloem characterized by conspicuous air lacunae, abundant starch-containing storage parenchyma, few sieve elements, and rings of schizogenous secretory canals. Xylem characterized by abundant starch-containing storage parenchyma, few tracheary elements, and a lack of secretory canals. Druse crystals are sometimes present with vascular parenchyma cells.

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* <561>: NMT 2.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Alcohol-Soluble Extractives*, *Method 2* <561>: NLT 14.0%
- **LOSS ON DRYING** <731>: Dry 1.0 g of finely powdered Asian Ginseng at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 8.0%, determined on 1.0 g of finely powdered Asian Ginseng

USP Powdered Asian Ginseng Extract RS

Powdered Asian Ginseng

DEFINITION

Powdered Asian Ginseng is Asian Ginseng reduced to a fine or very fine powder. It contains NLT 0.2% of ginsenoside Rg₁ and NLT 0.1% of ginsenoside Rb₁, both calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution: 5 mg/mL each of arbutin and escin, in methanol
Sample solution: 1.0 g of Powdered Asian Ginseng in a 25-mL flask fitted with a reflux condenser. Add 10.0 mL of a mixture of methanol and water (7:3), and heat under reflux for 15 min. Cool, filter, and dilute the filtrate with methanol to 10.0 mL.
Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)
Application volume: 20 μL, as bands
Developing solvent system: The upper layer of a mixture of butyl alcohol, ethyl acetate, and water (10:2.5:5) in an unsaturated chamber
Spray reagent: Dissolve 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid, and add 85 mL of methanol, mix, and carefully add 5 mL of sulfuric acid to this mixture.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to dry. Spray with *Spray reagent*. Heat the plate at 105°–110° for 10 min, and examine the plate.

System suitability: The *Standard solution* chromatogram shows, in the upper third, a brown zone corresponding to arbutin, and in the lower third, a gray zone corresponding to escin.

Acceptance criteria: The *Sample solution* exhibits violet-gray zones corresponding to ginsenoside Rg₁ in the upper portion and to ginsenoside Re in the middle and in between the zones corresponding to arbutin and escin in the *Standard solution*. A violet-gray zone corresponding to ginsenoside Rb₁ is located at the same R_F value as the gray zone corresponding to escin in the *Standard solution*. Other, less intense bands may be observed between the zones due to ginsenosides Rb₁ and Re, and the zone closest to the origin corresponds to ginsenoside Rc. Other spots may be visible in the lower third of the chromatogram.

- **B.** The retention times of the peaks for ginsenosides Rg₁, Re, Rf, Rb₁, Rc, and Rd in the *Sample solution* chromatogram correspond to those in the *Standard solution*, as obtained in the test for *Content of Ginsenosides Rb₁ and Rg₁*. The ratio of the peak area for ginsenoside Rb₂ to the peak area for ginsenoside Rb₁ is NLT 0.4 (differentiation from American Ginseng).

COMPOSITION

- **CONTENT OF GINSENOSES RB₁ AND RG₁**

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See *Table 1*.

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the 6 major ginsenosides, in replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of ginsenosides Rb₁ and Rg₁ in the portion of Powdered Asian Ginseng taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response of ginsenoside Rg₁ or ginsenoside Rb₁ from the *Sample solution*

r_S = peak response of ginsenoside Rg₁ or ginsenoside Rb₁ from the *Standard solution*

C_S = concentration of ginsenoside Rg₁ or ginsenoside Rb₁ in the *Standard solution* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Powdered Asian Ginseng used to prepare the *Sample solution* (mg)

Acceptance criteria

Ginsenoside Rg₁: NLT 0.2% on the dried basis

Ginsenoside Rb₁: NLT 0.1% on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method III <231>:** NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis <561>:** Meets the requirements
- **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 10² cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Pale yellowish-brown powder with a slightly aromatic odor. When examined under a microscope, the powder shows the following: traces of cork composed of thin-walled polygonal cells but mainly with phelloderm on the outside; wide cortex of parenchymatous cells with numerous secretory canals arranged in concentric zones; parenchymatous xylem with nonlignified tracheids and slightly lignified vessels with spiral and reticulate thickening, isolated or in small groups; small granules of starch 0.5–1.0 μm in diameter in all of the parenchymatous cells; and occasional cluster crystals of calcium oxalate in the cells of the central region.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store in a cool, dry place.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived.
- **USP REFERENCE STANDARDS** <11>
USP Powdered Asian Ginseng Extract RS

Powdered Asian Ginseng Extract**DEFINITION**

Powdered Asian Ginseng Extract is prepared from Asian Ginseng by maceration, percolation, or both processes performed at room temperature with suitable solvents such as alcohol, methanol, water, or mixtures of these solvents, and by concentrating the fluidextract at temperatures below 50°. The ratio of the starting crude plant material to Powdered Asian Ginseng Extract is between 3:1 and 7:1. It contains NLT 3.0% of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd combined, calculated on the anhydrous basis. It may contain other added substances.

IDENTIFICATION**A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Extraction column: Use a solid-phase extraction column that contains C18 packing with 55- to 105-μm particle size and a ratio of sorbent mass to column volume of 360 mg/0.85 mL, or equivalent. Condition the column before use by washing with 3 mL of methanol and 8 mL of water.

Standard solution: Transfer about 0.1 g of USP Powdered Asian Ginseng Extract RS to a 5-mL volumetric flask, and proceed as directed for the *Sample solution*, beginning with "Dissolve in water".

Sample solution: About 1.0 g of Powdered Asian Ginseng Extract in a 25-mL volumetric flask. Dissolve in water, sonicating if necessary. Dilute with water to volume. Transfer 4.0 mL of this solution to the *Extraction column*, wash with 10 mL of water, and discard the eluate. Elute the column with 2 mL of methanol. [NOTE—Do not use vacuum, elute manually and slowly.] Collect the eluate in a suitable vial.

Adsorbent: 0.2-mm layer of chromatographic silica gel mixture on a high-performance thin-layer plate

Application volume: 10 μL, as bands

Developing solvent system: Chloroform, methanol, and water (65:35:10). Use the lower phase.

Spray reagent: Alcohol, acetic anhydride, and sulfuric acid (18:1:1)

Analysis

Samples: *Standard solution* and *Sample solution*
Saturate the chamber with *Developing solvent system* for 2 h. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to dry. Spray with *Spray reagent*, and heat in an oven at 105° for 10 min. Immediately examine the plate in white light.

Acceptance criteria: The *Sample solution* exhibits, among other spots, eight brown-violet spots at the *R_f* values of about 0.70, 0.60, 0.50, 0.36, 0.30, 0.28, 0.20, and 0.18, corresponding in color and *R_f* values to those obtained for the *Standard solution*.

- **B.** Add 2 mL of glacial acetic acid to 0.1 g of Powdered Asian Ginseng Extract, warm for 5 min in a hot water bath, and filter. Gently add 0.5 mL of sulfuric acid to 1.0 mL of the filtrate.
Acceptance criteria: A red-brown color develops at the zone of contact.
- **C.** The retention times of the peaks for ginsenosides Rg₁, Re, Rf, Rb₁, Rb₂, Rc, and Rd in the *Sample solution* chro-

matogram correspond to those in the *Standard solution*, as obtained in the test for *Content of Ginsenosides*. The ratio of the peak area of Rb₂ to the peak area of Rb₁ is NLT 0.4 (differentiation from American Ginseng).

COMPOSITION**• CONTENT OF GINSENOSES**

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	76	24
12	76	24
28	65	35
51.5	56.5	43.5
52.5	0	100
64.5	76	24
77	76	24

Diluent: Alcohol and water (4:6)

Standard solution: 24 mg/mL of USP Powdered Asian Ginseng Extract RS in *Diluent*. Dissolve by sonicating for 10 min, mix, and filter.

Sample solution: Proceed as directed for *Standard solution*, except use Powdered Asian Ginseng Extract.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Analytical column: 4.6-mm × 15-cm; 3-μm packing L1

Guard column: 4.6-mm × 2.0-cm; packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the 6 major ginsenosides, in replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the peaks for the ginsenosides by comparison with the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used, and measure the peak areas for the 6 major ginsenosides.

Calculate the percentage of each relevant ginsenoside (Rg₁, Re, Rb₁, Rc, Rb₂, and Rd) in the portion of Powdered Asian Ginseng Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak area for each relevant ginsenoside from the *Sample solution*

r_S = peak area for each relevant ginsenoside from the *Standard solution*

C_S = concentration of USP Powdered Asian Ginseng Extract RS in the *Standard solution* (mg/mL)

C_U = concentration of Powdered Asian Ginseng Extract in the *Sample solution* (mg/mL)

P = labeled amount, in percentage, of each relevant ginsenoside in the USP Powdered Asian Ginseng Extract RS

Calculate the percentage of ginsenosides by adding the percentages of each relevant ginsenoside.

Acceptance criteria: NLT 3.0% on the anhydrous basis

CONTAMINANTS

- **HEAVY METALS** (231): NMT 30 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 300 cfu/g. The total combined molds and yeasts count does not exceed 100 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 7.0%, determined on a 0.15-g specimen
- **ALCOHOL DETERMINATION**, *Method II* (611): NMT 0.25%

- **USP REFERENCE STANDARDS** (11)
USP Powdered Asian Ginseng Extract RS

Asian Ginseng Tablets

DEFINITION

Asian Ginseng Tablets are prepared from Powdered Asian Ginseng Extract. They contain NLT 90.0% and NMT 110.0% of Powdered Extract, calculated as the sum of ginsenosides Rg₁, Re, Rb₁, Rc, Rb₂, and Rd.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)
Standard solution: 5 mg/mL each of arbutin and escin, in methanol
Sample solution: Transfer the equivalent of 100 mg of Powdered Extract from powdered Tablets to a conical flask, and extract three times, each with a 20-mL portion of a mixture of methanol and water (4:1), in a 55° bath for 30 min, stirring with a magnetic stirrer. Evaporate the combined extracts to dryness in vacuum between 45° and 50°, and dissolve the residue in 10 mL of a mixture of methanol and water (3:2).
Application volume: 20 µL, as bands
Developing solvent system: The upper layer of a mixture of butyl alcohol, ethyl acetate, and water (4:1:2) in an unsaturated chamber
Spray reagent: 0.5 mL of anisaldehyde in 10 mL of glacial acetic acid. Add 85 mL of methanol, carefully add 5 mL of sulfuric acid, and mix.
Analysis
Samples: *Standard solution* and *Sample solution*
Proceed as directed in the chapter. Remove the plate from the developing chamber, and allow it to dry.
Spray with *Spray reagent*. Heat the plate at 105°–110° for 10 min, and examine the plate.
Acceptance criteria: The chromatogram of the *Standard solution* shows, in the upper third, a brown zone corresponding to arbutin and, in the lower third, a gray zone corresponding to escin. Between these two zones, the chromatogram of the *Sample solution* exhibits violet-gray zones corresponding to ginsenoside Rg₁ in the upper portion and to ginsenoside Re in the middle. A violet-gray zone corresponding to ginsenoside Rb₁ is lo-

cated at the same R_F value as the gray zone corresponding to escin in the chromatogram of the *Standard solution*. Other, less intense bands may be observed between the zones due to ginsenosides Rb₁ and Re, and the zone closest to the origin corresponds to ginsenoside Rc. Other spots may be visible in the lower third of the chromatogram.

- **B.** The retention times of the relevant analytes of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the test for *Content of Ginsenosides*. The retention time of the peak for ginsenoside R_F of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Ginsenosides*.

STRENGTH

• CONTENT OF GINSENOSES

Diluent: Water and alcohol (3:2)

Solution A: Water

Solution B: Acetonitrile and water (4:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	76	24
12	76	24
28	65	35
51.5	56.5	43.5
52.5	0	100
64.5	76	24
77	76	24

Standard solution: 40 mg/mL of USP Powdered Asian Ginseng Extract RS in *Diluent*. Filter.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a quantity of the powder, equivalent to 200 mg of Powdered Extract to a conical flask, and extract three times, each with a 20-mL portion of a mixture of methanol and water (4:1), in a 55° bath for 30 min, stirring with a magnetic stirrer. Evaporate the combined extracts to dryness in a vacuum between 45° and 50°. Dissolve the residue in 5.0 mL of *Diluent*, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column

Guard: 4.6-mm × 2.0-cm; packing L1

Analytical: 4.6-mm × 15-cm; 3-µm packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The *Standard solution* chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used.

Relative standard deviation: NMT 2.0%, determined for the sum of the peak areas for the six major ginsenosides, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*
Record the chromatograms, identify the peaks for the ginsenosides by comparison with the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used, and measure the peak areas for the six major ginsenosides. Calculate the quantity, in mg, of each relevant ginsenoside (Rg₁, Re, Rb₁, Rc, Rb₂, and Rd) in the portion of Tablets taken:

$$\text{Result} = 0.05 \times (r_u/r_s) \times C_s \times P$$

- r_U = peak areas for each relevant ginsenoside from the *Sample solution*
 r_S = peak areas for each relevant ginsenoside from the *Standard solution*
 C_S = concentration of USP Powdered Asian Ginseng Extract RS in the *Standard solution* (mg/mL)
 P = labeled amount, in percentage, of each relevant ginsenoside in the USP Powdered Asian Ginseng Extract RS lot being used

Calculate the content of total ginsenosides, T , in mg, by adding the amounts of individual ginsenosides.
 Calculate the percentage of Powdered Extract with respect to the label claim:

$$\text{Result} = T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

- T = content of total ginsenosides in the portion of Tablets taken (mg)
 A_{WT} = average weight of Tablets (mg/Tablet)
 W = weight of the portion of Tablets taken (mg)
 L_E = content of total ginsenosides in 100 mg of the Extract used to prepare the Tablets (mg)
 L = amount of Extract per Tablet according to label claim (mg/Tablet)

Acceptance criteria: 90.0%–110.0% of Powdered Extract, calculated as the sum of ginsenosides R_{g1} , R_E , R_{b1} , R_C , R_{b2} , and R_d

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS <2040>:** Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:** Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 1000 cfu/g. Tablets meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. The label also indicates the amount of Powdered Extract, in mg/Tablet, and the content, in mg, of ginsenosides per 100 mg of Powdered Extract.
- **USP REFERENCE STANDARDS <11>**
USP Powdered Asian Ginseng Extract RS

Andrographis

DEFINITION

Andrographis consists of the dried stems and leaves of *Andrographis paniculata* (Burm. f.) Nees (Fam. Acanthaceae). It contains NLT 1.0% of diterpene lactones, calculated on the dried basis as the sum of andrographolide, neoandrographolide, 14-deoxy-11,12-didehydroandrographolide and andrograpanin.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>**
Standard solution 1: Use *Standard solution A*, prepared as directed in the test for *Content of Diterpene Lactones*.
Standard solution 2: Sonicate an amount of USP Powdered Andrographis Extract RS, equivalent to about 15 mg of diterpene lactones, for 10–15 min in 25 mL of methanol, centrifuge, and use the supernatant.

Sample solution: Use *Sample stock solution*, prepared as directed in the test for *Content of Diterpene Lactones*.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)

Application volume: 10 μL , as 5–10 mm bands

Developing solvent system: Chloroform, acetone, and toluene (2:2:1)

Spray reagent: A mixture of 1% vanillin in alcohol and 10% sulfuric acid in alcohol (1:1)

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the length of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits three main grayish blue zones with R_f values of approximately 0.4, 0.6, and 0.8 that correspond in position and color to zones in *Standard solution 2*. *Standard solution 1* exhibits a grayish blue zone due to andrographolide at an R_f of about 0.4. The *Sample solution* exhibits a zone similar in color and R_f value to that due to andrographolide in *Standard solution 1*.

- **B.** The retention time of the main peak of the *Sample solution* obtained in the test for *Content of Diterpene Lactones* corresponds to that of andrographolide in *Standard solution A*. Identify other diterpene lactone peaks in the *Sample solution* by comparison with *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Andrographis Extract RS. The *Sample solution* shows additional peaks corresponding to neoandrographolide, 14-deoxy-11,12-didehydroandrographolide, and andrograpanin.

COMPOSITION

• CONTENT OF DITERPENE LACTONES

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Use filtered and degassed acetonitrile.

Standard solution A: Dissolve a weighed quantity of USP Andrographolide RS in methanol to obtain a solution having a known concentration of about 1.0 mg/mL. Transfer 5.0 mL of this solution to a 10-mL volumetric flask, dilute with acetonitrile to volume, and mix.

Standard solution B: Transfer an amount of USP Powdered Andrographis Extract RS, equivalent to about 25 mg of diterpene lactones, to a 50-mL volumetric flask, add 25 mL of methanol, heat gently for 15–20 min, dilute with acetonitrile to volume, and mix. Before injection, pass through a membrane filter of 0.45- μm or finer pore size, discarding the first 5 mL of the filtrate.

Sample stock solution: Transfer about 2.0 g of finely powdered Andrographis to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 15 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume to 50.0 mL using methanol.

Sample solution: Transfer 25.0 mL of *Sample stock solution* to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix. Before injection, pass through a membrane filter of 0.45- μm or finer pore size, discarding the first 5 mL of the filtrate.

Mobile phase: See the gradient table below.

Macroscopic: Stem is dark green, woody, 2–6 mm in diameter, bearing numerous branches, showing slightly swollen nodes, the upper part is distinctly quadrangular with four bulges in the four corners, and the lower part is somewhat rounded; texture fragile, easily broken; branches quadrangular, often narrowly winged in the upper part. Leaves are simple, opposite, short petiolated or nearly sessile; lamina crumpled and easily broken, when whole, lanceolate or ovate-lanceolate, 2–7 cm long, 1–3 cm wide, with acuminate apex, reticulate venation and cuneate-decurrent base, margin entire or undulate; the upper surface green, the lower surface grayish green; both surfaces are glabrous. Pharmacopeial article consists of dry mixtures of crisp, dark-green broken leaves and quadrangular stems; leaves brittle; stems fracture short, fibrous.

Histology

Transverse section of stems: Epidermal layer showing cells containing round, long-elliptical or clavate calcium carbonate deposits (cystoliths), 1–4 celled nonglandular hairs and multicellular, disk-shaped glandular hairs; collenchyma below the epidermis and in the bulges; endodermis is distinct; vascular bundles surround the parenchyma of the central pith; small acicular crystals of calcium oxalate present in the cortex and pith.

Transverse section of leaves: Subsquare or rectangular upper and lower epidermal cells; lower epidermal cells are relatively smaller; both epidermal layers show cells containing cystoliths, nonglandular hairs and glandular hairs similar to those of the stem; mesophyll composed of 1–2 layers of palisade parenchyma and spongy parenchyma; loosely arranged spongy parenchyma appear across the upper part of the midrib; vascular bundles of midrib are collateral and grooved; cells containing cystoliths appear above the xylem.

- **LOSS ON DRYING** <731>: Dry 1.0 g of finely powdered Andrographis at 105° for 3 h: it loses NMT 12.0% of its weight.

- USP Andrographolide RS
- USP Powdered Andrographis Extract RS

Powdered Andrographis Extract

DEFINITION

Powdered Andrographis Extract is prepared from Andrographis by extraction with methanol or alcohol. The ratio of plant material to extract is between 15:1 and 10:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of diterpene lactones, calculated on the dried basis as the sum of andrographolide, neoandrographolide, 14-deoxy-11,12-didehydroandrographolide, and andrograpanin. The content of 14-deoxy-11,12-didehydroandrographolide is NMT 15% of the total diterpene lactones. It may contain suitable added substances as carriers.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

Standard solution 1: Use *Standard solution A*, prepared as directed in the test for *Content of Diterpene Lactones*.

Standard solution 2: Sonicate for 10–15 min a quantity of USP Powdered Andrographis Extract, equivalent to about 15 mg of diterpene lactones, in 25 mL of methanol. Centrifuge, and use the supernatant.

Sample solution: Sonicate for 10–15 min a quantity of Powdered Andrographis Extract, equivalent to about 15 mg of diterpene lactones, in 25 mL of methanol. Centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)

Application volume: 10 μL , as 5–10 mm bands

Developing solvent system: Chloroform, acetone, and toluene (2:2:1)

Suitability requirements
The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Andrographis Extract RS.

Column efficiency: NLT 5000 theoretical plates, *Standard solution A*

Tailing factor: NMT 1.5 for the andrographolide peak, *Standard solution A*

Relative standard deviation: NMT 2.0%, determined from the andrographolide peak for replicate injections, *Standard solution A*

Resolution: NLT 5 between the neoandrographolide and 14-deoxy-11,12-didehydroandrographolide peaks, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Andrographis Extract RS being used, identify the retention times of the peaks corresponding to different diterpene lactones. The approximate relative retention times of the different diterpene lactones are provided in the following table:

Analyte	Relative Retention Time
Andrographolide	1.00
Neoandrographolide	1.16

Analyte	Relative Retention Time
14-Deoxy-11,12-didehydroandrographolide	1.31
Andrograpanin	1.50

Separately calculate the percentages of andrographolide, neoandrographolide, 14-deoxy-11,12-didehydroandrographolide, and andrograpanin in the portion of Powdered Andrographis Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times 5F$$

r_U = peak response for each diterpene lactone from the *Sample solution*

r_S = peak response for andrographolide from *Standard solution A*

C_S = concentration of USP Andrographolide RS in *Standard solution A* (mg/mL)

W = weight of Powdered Andrographis Extract taken to prepare the *Sample solution* (g)

F = conversion factor for each analyte (1.00 for andrographolide, 3.90 for neoandrographolide, 1.45 for 14-deoxy-11,12-didehydroandrographolide, and 2.65 for andrograpanin)

Acceptance criteria: 90.0%–110.0%, on the dried basis, of the labeled amount of diterpene lactones calculated as the sum of the percentages of andrographolide, neoandrographolide, 14-deoxy-11,12-didehydroandrographolide, and andrograpanin

IMPURITIES

Inorganic Impurities

• **HEAVY METALS**, *Method II* ⟨231⟩: NMT 20 ppm

Organic Impurities

• **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* ⟨561⟩: Meets the requirements

SPECIFIC TESTS

• **LOSS ON DRYING** ⟨731⟩: Dry 2.0 g at 105° for 3 h: it loses NMT 5.0% of its weight.

• **MICROBIAL ENUMERATION TESTS** ⟨2021⟩: The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined yeasts and molds count does not exceed 10³ cfu/g.

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** ⟨2022⟩: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. It meets other labeling requirements under *Botanical Extracts* ⟨565⟩.

Arginine—see *Arginine General Monographs*

Arginine Hydrochloride—see *Arginine Hydrochloride General Monographs*

Arginine Capsules

DEFINITION

Arginine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of arginine or arginine hydrochloride in an amount equivalent to arginine ($C_6H_{14}N_4O_2$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 1.5 mg/mL of USP L-Arginine RS or USP Arginine Hydrochloride RS in water

Sample solution: Weigh the content of NLT 20 Capsules, mix, and transfer a portion of the content, equivalent to about 150 mg of arginine, to a 100-mL volumetric flask, add 80 mL of water, sonicate for 15 min, dilute with water to volume, mix, and filter.

Application volume: 5 μ L

Developing solvent system: Isopropyl alcohol and ammonium hydroxide (7:3)

Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

Analysis: Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*. Dry the plate at 100°–105° until the ammonia disappears completely. Spray with the *Spray reagent*, and heat at 100°–105° for about 15 min. Examine the plate under white light.

Acceptance criteria: The principal spot from the *Sample solution* corresponds in appearance and R_f value to that of the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Strength*.

STRENGTH

• PROCEDURE

Buffer: 6.9 mg/mL of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Solution A: 0.5 mg/mL of 1-octanesulfonic acid sodium salt in *Buffer*

Mobile phase: *Solution A* and acetonitrile (95:5)

Standard solution: 1.5 mg/mL of USP L-Arginine RS or USP Arginine Hydrochloride RS in *Buffer*

Sample solution: Weigh the content of NLT 20 Capsules, mix, and transfer a portion of the content, equivalent to about 150 mg of arginine, to a 100-mL volumetric flask, add 80 mL of *Buffer*, sonicate for 15 min, dilute with *Buffer* to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 25-cm; packing L7

Flow rate: 0.8 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Relative standard deviation: NMT 2.0% from the arginine peak, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of arginine in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
- r_S = peak response from the *Standard solution*
- C_S = concentration of the *Standard solution* (mg/mL)
- C_U = nominal concentration of Arginine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of arginine ($C_6H_{14}N_4O_2$)

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS

(2040): Meet the requirements for *Dissolution*

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 100 rpm

Time: 60 min

Standard solution: Proceed as directed in the *Procedure* for *Strength*.

Sample solution: Sample per *Disintegration and Dissolution of Dietary Supplements* (2040). Dilute with *Medium* to a concentration similar to that of the *Standard solution*.

Analysis: Determine the amount of arginine dissolved in the *Procedure* for *Strength*, making any necessary modifications.

Tolerances: NLT 75% of the labeled amount of arginine ($C_6H_{14}N_4O_2$) is dissolved.

- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the form of arginine that is used and the equivalent amount of arginine.
- **USP REFERENCE STANDARDS** (11)
USP L-Arginine RS
USP Arginine Hydrochloride RS

Arginine Tablets

DEFINITION

Arginine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of arginine or arginine hydrochloride in an amount equivalent to arginine ($C_6H_{14}N_4O_2$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 1.5 mg/mL of USP L-Arginine RS or USP Arginine Hydrochloride RS in water

Sample solution: Weigh and finely powder NLT 20 Tablets, mix, and transfer a portion of the powder, equivalent to about 150 mg of arginine, to a 100-mL volumetric flask, add 80 mL of water, sonicate for 15 min, dilute with water to volume, mix, and filter.

Application volume: 5 μ L

Developing solvent system: Isopropyl alcohol and ammonium hydroxide (7:3)

Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

Analysis: Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*. Dry the plate at 100°–105° until the ammonia disappears completely. Spray with the *Spray reagent*, and heat at 100°–105° for about 15 min. Examine the plate under white light.

Acceptance criteria: The principal spot from the *Sample solution* corresponds in appearance and R_f value to that from the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Strength*.

Ascorbic Acid Oral Solution—see *Ascorbic Acid Oral Solution General Monographs*

Ascorbic Acid Tablets—see *Ascorbic Acid Tablets General Monographs*

Ashwagandha Root

DEFINITION

Ashwagandha Root is the dried mature roots of *Withania somnifera* (L.) Dunal (Fam. Solanaceae). It contains NLT 0.3% of withanolides, calculated on the dried basis as the sum of withanolide aglycones, calculated as withanolide A, and withanolide glycosides, calculated as withanoside IV.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

Standard solution: About 200 mg of USP Powdered Ashwagandha Root Extract RS in 10 mL of methanol. Heat gently for 10–15 min, centrifuge, and use the supernatant. [NOTE—Save the remaining volume of the supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Transfer about 5.0 g of Ashwagandha Root, finely powdered, to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 10–15 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum to about 40 mL, and adjust the volume with methanol to 50.0 mL. [NOTE—Save the remaining volume of the *Sample solution* for use in the test for *Content of Withanolides*.]

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 25 µL

Developing solvent system: A mixture of ethyl acetate, toluene, and acetic acid (45:55:3)

Spray reagent: Mix 0.5 mL of anisaldehyde, 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of concentrated sulfuric acid in the order given.

Analysis

Samples: *Standard solution* and *Sample solution*
Apply the *Samples* as bands to a suitable plate (see *Chromatography* <621>). Use a saturated chamber. Develop until the solvent front has moved up about 90% of the length of the plate. Dry the plate, spray with *Spray reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits five main grayish-blue bands with R_f values of approximately 0.12, 0.29, 0.47, 0.67, and 0.73 that are similar in position and color to the main bands from the *Standard solution*. Other less intense bands are observed for the *Sample solution* and the *Standard solution*.

- **B.** The *Sample solution* in the test for *Content of Withanolides* shows main peaks at retention times corresponding to those of withanolide A and withanoside IV in *Standard solution A* and *Standard solution B*, respectively. Identify other withanolide peaks in the *Sample solution* by comparison with *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used. The *Sample solution* shows additional peaks corresponding to some of the following withanolides: physagulin D, 27-hydroxy-withanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanone, and withanolide B.

COMPOSITION**• CONTENT OF WITHANOLIDES**

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Solution B: Filtered and degassed acetonitrile

Standard solution A: Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution B: Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution C: Dilute 5 mL of the *Standard solution* prepared in *Identification test A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter of 0.45-μm or finer pore size.

Sample solution: Use the *Sample solution* prepared in *Identification test A*. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
30	95	5
40	95	5

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 25-cm, end-capped; packing L1

Temperature: 27 ± 1°

Flow rate: 1.5 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution C*
Using the chromatogram of *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used, identify the retention times of the peaks corresponding to the various withanolide aglycones and glycosides. The approximate relative retention times of the withanolide aglycones and glycosides are provided in the following table.

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-hydroxywithanone	0.80
Withanoside V	0.89
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

The chromatogram for *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used.

Resolution: NLT 1.0 for the withanolide A and withanone peaks, *Standard solution C*; NLT 3.0 between

the withaferin A and coeluting withanoside V and withanoside VI peaks, *Standard solution C*

Tailing factor: NMT 1.5 for the withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*

r_S = peak response of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

W = weight of Ashwagandha Root taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withanoside IV, withanoside V, and withanoside VI from the *Sample solution*

r_S = peak response of USP Withanoside IV from *Standard solution B*

C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)

W = weight of Ashwagandha Root taken to prepare the *Sample solution* (g)

Acceptance criteria: The sum of the percentages of withanolide aglycones and withanolide glycosides is NLT 0.3%, calculated on the dried basis. [NOTE—Because of inherent variations, some of the withanolides mentioned in this test may be present in minor quantities or may be totally absent. The sample will be deemed compliant if the sum of the total withanolides is NLT 0.3%.]

IMPURITIES**Inorganic Impurities**

• **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** <561>: NMT 1.0%

• **HEAVY METALS, Method II** <231>: NMT 20 ppm

Organic Impurities

• **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** <561>: NMT 2.0%

• **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis** <561>: Meets the requirements

SPECIFIC TESTS**• BOTANIC CHARACTERISTICS**

Macroscopic: Primary roots are not branched and are straight, conical, or fingerlike in shape and variable in thickness with age; some carry a crown, consisting of a number of remains of stem base; the outer surface is buff to grayish-yellow with longitudinal wrinkles; fracture is short and uneven; secondary roots are thin and fibrous.

Histology

Transverse section of roots: It shows a narrow band of yellowish crumpled cork, moderate-size cortex and a wide wood. The cork cells are rectangular, radially flattened, nonlignified, and filled with starch grains and reddish brown content; cork cambium is 2–4 diffused rows of cells; secondary cortex is formed of 20–25 rows of thin-wall parenchymatous cells, filled

with starch grains, and shows occasional microspenoidal crystals of calcium oxalate; phloem consists of sieve tubes, companion cells, and phloem parenchyma; vascular cambium consists of tangentially elongated parenchymatous cells; vessels and tracheids are in radial rows toward the periphery of the wood; medullary rays are uniseriate to 2- to 3-seriate, and are filled with starch grains; scattered vessels in groups are embedded in the parenchyma; vessels have pitted and scalariform thickening, and generally the end walls are perforated; and a few fibers with thick lignified walls are also found scattered in the wood.

- **LOSS ON DRYING** (731): Dry 1.0 g of finely powdered Ashwagandha Root at 105° for 3 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 7.0%, determined on 1.0 g of finely powdered Ashwagandha Root
- **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2** (561): NLT 10.0%
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the bile-tolerant Gram-negative bacteria count does not exceed 10³ cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*
- **ARTICLES OF BOTANICAL ORIGIN, Aflatoxins** (561): Meets the requirements

ADDITIONAL REQUIREMENTS

- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11)
USP Powdered Ashwagandha Root Extract RS
USP Withanolide A RS
USP Withanoside IV RS

Powdered Ashwagandha Root

DEFINITION

Powdered Ashwagandha Root is Ashwagandha Root reduced to a fine or very fine powder.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Standard solution: Heat gently, for 10–15 min, about 200 mg of USP Powdered Ashwagandha Root Extract RS in 10 mL of methanol, centrifuge, and use the supernatant. [NOTE—Save the remaining volume of the supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Transfer about 5.0 g of Powdered Ashwagandha Root to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 10–15 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum to about 40 mL, and adjust the volume with methanol to 50.0 mL. [NOTE—Save the remaining volume of the *Sample solution* for use in the test for *Content of Withanolides*.]

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 25 µL

Developing solvent system: A mixture of ethyl acetate, toluene, and acetic acid (45:55:3)

Spray reagent: Mix 0.5 mL of anisaldehyde, 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of concentrated sulfuric acid in the order mentioned.

Analysis

Samples: *Standard solution* and *Sample solution*
Apply the *Samples* as bands to a suitable plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits five main grayish-blue bands with R_f values of approximately 0.12, 0.29, 0.47, 0.67, and 0.73 that are similar in position and color to the main bands from the *Standard solution*. Other less intense bands are observed for the *Sample solution* and *Standard solution*.

- **B.** The *Sample solution* from the test for *Content of Withanolides* shows main peaks at retention times corresponding to those of withanolide A and withanoside IV in *Standard solution A* and *Standard solution B*, respectively. Identify other withanolide peaks in the *Sample solution* by comparison with *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS. The *Sample solution* shows additional peaks corresponding to some of the following withanolides: physagulin D, 27-hydroxywithanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanone, and withanolide B.

COMPOSITION

• CONTENT OF WITHANOLIDES

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Solution B: Filtered and degassed acetonitrile

Standard solution A: Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution B: Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution C: Dilute 5 mL of the *Standard solution* prepared in *Identification test A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter of 0.45-µm or finer pore size.

Sample solution: Use the *Sample solution* prepared in *Identification test A*. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
30	95	5
40	95	5

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 25-cm, end-capped; packing L1

Temperature: 27 ± 1°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution A* and *Standard solution C*
Using the chromatogram of *Standard solution C* and the Reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS, identify the retention times of the peaks corresponding to the different withanolide aglycones and glycosides. The approximate relative retention times of the withanolide aglycones and glycosides are provided in the following table.

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-hydroxywithanone	0.80
Withanoside V	0.89
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

The chromatogram of *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS.

Resolution: NLT 1.0 for the withanolide A and withanone peaks, and NLT 3.0 between the peak corresponding to withaferin A and the peak corresponding to the coeluting withanoside V and withanoside VI, *Standard solution C*

Tailing factor: NMT 1.5 for the withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B in the *Sample solution*

r_S = peak response of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

W = weight of Powdered Ashwagandha Root taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withanoside IV, withanoside V, and withanoside VI in the *Sample solution*

r_S = peak response of USP Withanoside IV RS from *Standard solution B*

C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)

W = weight of Powdered Ashwagandha Root taken to prepare the *Sample solution* (g)

Acceptance criteria: Add the percentages of withanolide aglycones and withanolide glycosides: NLT 0.3% is found, calculated on the dried basis. [NOTE—Due to inherent variations, some of the withanolides mentioned in the above test may be present in minor quantities or may be totally absent. The sample will be deemed compliant as long as the sum of the total withanolides is NLT 0.3%.]

IMPURITIES

Inorganic Impurities

• **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* <561>: NMT 1.0%

• **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

Organic Impurities

• **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: It is a dusty white or grey to light brown powder with a characteristic odor and a mucilagenous, bitter, acrid taste.

Histology

Microscopic examination: It shows collapsed cork cells filled with starch grains and reddish-brown content; thin-walled cortex parenchyma cells filled with starch grains and occasional microsphenoidal crystals of calcium oxalate; vessels, with pitted and scalariform thickening, and generally with end walls perforated; a few fibers with thick lignified walls and simple pits; abundant starch grains, mostly simple, sometimes compound, spherical, reniform-oval with central hilum.

• **LOSS ON DRYING** <731>: Dry 1.0 g at 105° for 3 h: it loses NMT 12.0% of its weight.

• **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 7.0%, determined on 1.0 g of Powdered Ashwagandha Root

• **ARTICLES OF BOTANICAL ORIGIN**, *Alcohol-Soluble Extractives*, *Method 2* <561>: NLT 10.0%

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the bile-tolerant Gram-negative bacteria count does not exceed 10³ cfu/g.

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

• **ARTICLES OF BOTANICAL ORIGIN**, *Aflatoxins* <561>: Meets the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

• **USP REFERENCE STANDARDS** <11>

USP Powdered Ashwagandha Root Extract RS

USP Withanolide A RS

USP Withanoside IV RS

Powdered Ashwagandha Root Extract

DEFINITION

Powdered Ashwagandha Root Extract is prepared from Ashwagandha using methanol, alcohol, water, or mixtures

of these solvents. It contains NLT 2.5% of withanolides, calculated on the dried basis as the sum of withanolide aglycones and withanolide glycosides.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

(201)

Standard solution: Heat gently for 10–15 min about 200 mg of USP Powdered Ashwagandha Extract Root RS in 10 mL of methanol, centrifuge, and use the supernatant. [NOTE—Save the remaining volume of the supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Heat gently for 10–15 min about 200 mg of Powdered Ashwagandha Root Extract in 10 mL of methanol, centrifuge, and use the supernatant.

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 25 μ L

Developing solvent system: A mixture of ethyl acetate, toluene, and acetic acid (45:55:3)

Spray reagent: Mix 0.5 mL of anisaldehyde, 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of concentrated sulfuric acid in the order mentioned.

Analysis

Samples: *Standard solution* and *Sample solution*
Apply the *Samples* as bands to a suitable plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the length of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits five main grayish-blue bands with R_f values of approximately 0.12, 0.29, 0.47, 0.67, and 0.73 that are similar in position and color to the main bands for the *Standard solution*. Other less intense bands are observed for the *Sample solution* and the *Standard solution*.

- **B.** The *Sample solution* in the test for *Content of Withanolides* shows main peaks at retention times corresponding to those of withanolide A and withanolide IV for *Standard solution A* and *Standard solution B*, respectively. Identify other withanolide peaks in the *Sample solution* by comparison with *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used. The *Sample solution* shows additional peaks corresponding to some of the following withanolides: physagulin D, 27-hydroxywithanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanone, and withanolide B.

COMPOSITION

• CONTENT OF WITHANOLIDES

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Solution B: Filtered and degassed acetonitrile

Standard solution A: Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution B: Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution C: Dilute 5 mL of the *Standard solution* prepared in *Identification test A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size.

Sample solution: Transfer about 100 mg of Powdered Ashwagandha Root Extract, weighed, to a 10-mL volumetric flask, add about 7 mL of methanol, heat gently

on a water bath for 15–20 min, dilute with methanol to volume, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
30	95	5
40	95	5

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm \times 25-cm, end-capped; packing L1

Temperature: 27 \pm 1°

Flow rate: 1.5 mL/min

Injection size: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution C*
Using the chromatogram of *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used, identify the retention times of the peaks corresponding to the various withanolide aglycones and glycosides. The approximate relative retention times of the withanolide aglycones and glycosides are provided in the following table.

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-hydroxywithanone	0.80
Withanoside V	0.89
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

The chromatogram for *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used.

Resolution: NLT 1.0 for the withanolide A and withanone peaks, and NLT 3.0 between the peak corresponding to withaferin A and the peak corresponding to coeluting withanoside V and withanoside VI, *Standard solution C*

Tailing factor: NMT 1.5 for the withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Powdered Ashwagandha Root Extract taken:

$$\text{Result} = (r_T/r_S)(C_S/W)$$

- r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*
- r_S = peak response of withanolide A from *Standard solution A*
- C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)
- W = weight of Powdered Ashwagandha Root Extract taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Powdered Ashwagandha Root Extract taken:

$$\text{Result} = (r_T/r_S)(C_S/W)$$

- r_T = sum of the peak responses for withanoside IV, withanoside V and withanoside VI from the *Sample solution*
- r_S = peak response of USP Withanoside IV from *Standard solution B*
- C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)
- W = weight of Powdered Ashwagandha Root Extract taken to prepare the *Sample solution* (g)

Acceptance criteria: The sum of the percentages of the withanolide aglycones and withanolide glycosides is NLT 2.5%, calculated on the dried basis. [NOTE—Because of inherent variations, some of the withanolides mentioned in this test may be present in minor quantities or may be totally absent. The sample will be deemed compliant if the sum of the total withanolides is NLT 2.5%.]

IMPURITIES

Inorganic Impurities

- **HEAVY METALS, Method II <231>:** NMT 20 ppm

Organic Impurities

- **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis <561>:** Meets the requirements

SPECIFIC TESTS

- **LOSS ON DRYING <731>:** Dry 2.0 g at 105° for 3 h: it loses NMT 6.0% of its weight.
- **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10³ cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

USP Withanoside IV RS

Aspartic Acid—see Aspartic Acid General Monographs

Bacopa

DEFINITION

Bacopa consists of the dried stems and leaves of *Bacopa monnieri* (L.) Pennell (Fam. Scrophulariaceae). It contains NLT 2.5% of triterpene glycosides, calculated on the dried basis as the sum of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C.

IDENTIFICATION

- **A.** Bacopa meets the requirements for *Specific Tests, Botanic Characteristics*.

- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>**

Standard solution: Transfer about 10 mg of USP Powdered Bacopa Extract RS to a 10-mL volumetric flask, and add about 8 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, mix, centrifuge, and use the supernatant.

Sample solution: Use the *Sample solution*, prepared as directed in the test for *Content of Triterpene Glycosides*.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)

Application volume: 15 μL, as 5–10 mm bands

Developing solvent system: Ethyl acetate, methanol, and water (7:2:1)

Spray reagent: 1% vanillin in alcohol and 10% sulfuric acid in alcohol (1:1)

Analysis

Samples: *Standard solution* and *Sample solution*
Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography <621>*). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at about 70°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits a main dark blue zone due to a mixture of bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C at an R_F value of approximately 0.6 and a faint pink spot due to bacopaside I at an R_F value of approximately 0.4, both of which correspond in position and color to zones in the chromatogram of the *Standard solution*. Other zones are observed for the *Sample solution* and *Standard solution*.

- **C. HPLC IDENTIFICATION TEST:** The *Sample solution* from the test for *Content of Triterpene Glycosides* shows a main peak at the retention time corresponding to that of bacoside A₃ in the chromatogram of *Standard solution A*. Identify other triterpene glycoside peaks in the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS. The *Sample solution* shows additional peaks corresponding to bacopaside I, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C.

COMPOSITION

- **CONTENT OF TRITERPENE GLYCOSIDES**

Solution A: Dissolve 0.14 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Use filtered and degassed acetonitrile.
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	70	30
25	60	40
26	70	30
30	70	30

Standard solution A: Sonicate a weighed quantity of USP Bacoside A₃ RS in methanol to obtain a solution with a concentration of about 0.5 mg/mL.

Standard solution B: Transfer about 10 mg of USP Powdered Bacopa Extract RS to a 10-mL volumetric flask, and add about 8 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, and mix. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first 5 mL of the filtrate.

Sample solution: Transfer about 2.5 g of Bacopa, finely powdered, to a 100-mL round-bottom flask fitted with a reflux condenser. Add 25 mL of methanol, reflux on a water bath for 10 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume to 100 mL using methanol. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first 5 mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 25-cm; 5-μm, endcapped, base-deactivated packing L1

Column temperature: 27 ± 1°

Flow rate: 1.5 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS being used.

Resolution: NLT 1.0 between the bacopaside II and bacoside A₃ peaks, *Standard solution B*

Tailing factor: NMT 1.5 for the bacoside A₃ peak, *Standard solution A*

Relative standard deviation: NMT 2% determined from the bacoside A₃ peak for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS, identify the retention times of the peaks corresponding to different triterpene glycosides. The approximate relative retention times of the different triterpene glycosides are provided in the following table.

Analyte	Relative Retention Time
Bacopaside I	0.73
Bacoside A ₃	1.00
Bacopaside II	1.04
The jujubogenin isomer of bacopasaponin C	1.15
Bacopasaponin C	1.22

Separately calculate the percentages of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C in the portion of Bacopa taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak response for each triterpene glycoside from the *Sample solution*

r_S = peak response for bacoside A₃ from *Standard solution A*

C_S = concentration of USP Bacoside A₃ RS in *Standard solution A* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Bacopa used to prepare the *Sample solution* (mg)

F = conversion factor for each analyte: 1.00 for bacoside A₃, 1.03 for bacopaside I, 0.81 for bacopaside II, 0.99 for the jujubogenin isomer of bacopasaponin C, and 0.75 for bacopasaponin C

Acceptance criteria: Add the percentages of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C: NLT 2.5% is found, calculated on the dried basis.

IMPURITIES

Inorganic Impurities

• **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** <561>: NMT 6.0%

• **HEAVY METALS, Method III** <231>: NMT 20 ppm

Organic Impurities

• **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matters** <561>: NMT 2.0%

• **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis** <561>: Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Stem is creeping, succulent, glabrous, soft, obtuse-angular; with long internodes, rooting at nodes; devoid of leaves toward the base; branches ascending. Leaves are simple, sessile or short petiolate, opposite, succulent, 1–2 mm thick; oblong-obovate or spatulate, margin entire or rarely dentate, apex rounded, midrib indistinct, 0.6–2.5 cm long, 3–8 mm wide; the upper surface is green, the lower surface is green and dotted. Pharmacopeial article is yellowish in color; consists of dry mixtures of broken leaves and stems, with majority of leaves detached; mild and hay-like odor, and very bitter taste.

Histology

Transverse section of stems: Epidermal layer; a wide cortex composed of thin-wall parenchyma cells and large intercellular spaces; xylem vessels radially arranged, uniseriate medullary rays; pith composed of thin-wall, round or isodiametric cells with distinct intercellular spaces. Resin canals and pericyclic sclereids are absent.

Transverse section of leaves: Shows a more or less isobilateral structure; epidermis with glandular hair and stomata; upper surface has more hairs and less stomata than the lower surface; mesophyll composed of spongy tissue, a few prisms of calcium oxalate, and vascular bundles are present.

• **LOSS ON DRYING** <731>: Dry 1.0 g of finely powdered Bacopa at 105° for 3 h: it loses NMT 12.0% of its weight.

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 18%, determined on 1.0 g of finely powdered Bacopa

• **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2** <561>: NLT 6.0%

- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.

USP Powdered Bacopa Extract RS

Powdered Bacopa

DEFINITION

Powdered Bacopa is Bacopa reduced to a powder or very fine powder. It contains NLT 2.5% of triterpene glycosides, calculated on the dried basis as the sum of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C.

IDENTIFICATION

- **A.** Powdered Bacopa meets the requirements under *Specific Tests, Botanic Characteristics*.

- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Standard solution: Transfer about 10 mg of USP Powdered Bacopa Extract RS to a 10-mL volumetric flask, and add about 8 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, mix, centrifuge, and use the supernatant.

Sample solution: Use the *Sample solution*, prepared as directed in the test for *Content of Triterpene Glycosides*.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)

Application volume: 15 μ L, as 5–10 mm bands

Developing solvent system: Ethyl acetate, methanol, and water (7:2:1)

Spray reagent: 1% vanillin in alcohol and 10% sulfuric acid in alcohol (1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at about 70°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits a main dark blue zone due to mixture of bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C at an R_F value of approximately 0.6 and a faint pink spot due to bacopaside I at an R_F value of approximately 0.4, both of which correspond in position and color to zones in the chromatogram of the *Standard solution*. Other zones are observed for the *Sample solution* and *Standard solution*.

- **C. HPLC IDENTIFICATION TEST:** The *Sample solution* from the test for *Content of Triterpene Glycosides* shows a main peak at a retention time corresponding to that of bacoside A₃ in the chromatogram of *Standard solution A*. Identify other triterpene glycoside peaks in the *Sample solution* by comparison with the chromatogram of *Standard*

solution B and the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS being used. The *Sample solution* shows additional peaks corresponding to bacopaside I, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C.

COMPOSITION

• CONTENT OF TRITERPENE GLYCOSIDES

Solution A: Dissolve 0.14 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Use filtered and degassed acetonitrile.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	70	30
25	60	40
26	70	30
30	70	30

Standard solution A: Sonicate an accurately weighed quantity of USP Bacoside A₃ RS in methanol to obtain a solution having a known concentration of about 0.5 mg/mL.

Standard solution B: Transfer about 10 mg of USP Powdered Bacopa Extract RS to a 10-mL volumetric flask, and add about 8 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first 5 mL of the filtrate.

Sample solution: Transfer about 2.5 g of Powdered Bacopa, accurately weighed, to a 100-mL round-bottom flask fitted with a reflux condenser. Add 25 mL of methanol, reflux on a water bath for 10 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume to 100 mL using methanol. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first 5 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm \times 25-cm; 5- μ m, endcapped, base-deactivated packing L1

Column temperature: 27 \pm 1°

Flow rate: 1.5 mL/min

Injection size: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS being used.

Resolution: NLT 1.0 between the bacopaside II and bacoside A₃ peaks, *Standard solution B*

Tailing factor: NMT 1.5 for the bacoside A₃ peak, *Standard solution A*

Relative standard deviation: NMT 2% determined from the bacoside A₃ peak for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS, identify the retention times of the peaks corresponding to different triterpene glycosides. The ap-

proximate relative retention times of the different triterpene glycosides are provided in the following table.

Analyte	Relative Retention Time
Bacopaside I	0.73
Bacoside A ₃	1.00
Bacopaside II	1.04
The jujubogenin isomer of bacopasaponin C	1.15
Bacopasaponin C	1.22

Separately calculate the percentages of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C in the portion of Powdered Bacopa taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

- r_U = peak response for each triterpene glycoside from the *Sample solution*
 r_S = peak response for bacoside A₃ from *Standard solution A*
 C_S = concentration of USP Bacoside A₃ RS in *Standard solution A* (mg/mL)
 V = final volume of the *Sample solution* (mL)
 W = weight of Powdered Bacopa used to prepare the *Sample solution* (mg)
 F = conversion factor for each analyte: 1.00 for bacoside A₃, 1.03 for bacopaside I, 0.81 for bacopaside II, 0.99 for the jujubogenin isomer of bacopasaponin C, and 0.75 for bacopasaponin C

Acceptance criteria: Add the percentages of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C: NLT 2.5% is found on the dried basis.

IMPURITIES

Inorganic Impurities

10³ cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10³ cfu/g.

- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11):
 USP Bacoside A₃ RS
 USP Powdered Bacopa Extract RS

Powdered Bacopa Extract

DEFINITION

Powdered Bacopa Extract is prepared from Bacopa by extraction with water, alcohol, methanol, or a mixture of these solvents. The ratio of plant material to extract is between 20:1 and 10:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of triterpene glycosides, calculated on the dried basis as the sum of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C. It may contain suitable added substances as carriers.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: Transfer about 10 mg of USP Powdered Bacopa Extract RS to a 10-mL volumetric flask, and add about 8 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, mix, centrifuge, and use the supernatant.

Sample solution: Sonicate for about 10 min an amount of Powdered Bacopa Extract equivalent to about 40 mg of triterpene glycosides in 10 mL of methanol, centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)

Application volume: 15 μL, as 5–10 mm bands

Developing solvent system: Ethyl acetate, methanol, and water (7:2:1)

Spray reagent: 1% vanillin in alcohol and 10% sulfuric acid in alcohol (1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at about 70°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits a main dark blue zone due to a mixture of bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C at an R_F value of approximately 0.6 and a faint pink spot due to bacopaside I at an R_F value of approximately 0.4, both of which correspond in position and color to zones in the chromatogram of the *Standard solution*. Other zones are observed for the *Sample solution* and *Standard solution*.

- **B. HPLC IDENTIFICATION TEST:** The *Sample solution* from the test for *Content of Triterpene Glycosides* shows a main peak at a retention time corresponding to that of bacoside A₃ in the chromatogram of *Standard solution A*. Identify other triterpene glycoside peaks in the *Sample solution* by comparison with the chromatogram of *Standard*

solution B and the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS being used. The *Sample solution* shows additional peaks corresponding to bacopaside I, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C.

COMPOSITION

• CONTENT OF TRITERPENE GLYCOSIDES

Solution A: Dissolve 0.14 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Use filtered and degassed acetonitrile.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	70	30
25	60	40
26	70	30
30	70	30

Standard solution A: Sonicate a weighed quantity of USP Bacoside A₃ RS in methanol to obtain a solution with a concentration of about 0.5 mg/mL.

Standard solution B: Transfer about 10 mg of USP Powdered Bacopa Extract RS to a 10-mL volumetric flask, and add about 8 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, and mix. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first 5 mL of the filtrate.

Sample solution: Transfer an amount of Powdered Bacopa Extract, equivalent to about 25 mg triterpene glycosides, to a 25-mL volumetric flask, and add 15 mL of methanol. Sonicate and heat gently for 15–20 min, dilute with methanol to volume, and mix. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first 5 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 25-cm; 5-μm, endcapped, base-deactivated packing L1

Column temperature: 27 ± 1°

Flow rate: 1.5 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements
Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS being used.

Resolution: NLT 1.0 between the bacopaside II and bacoside A₃ peaks, *Standard solution B*

Tailing factor: NMT 1.5 for the bacoside A₃ peak, *Standard solution A*

Relative standard deviation: NMT 2% determined from the bacoside A₃ peak for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Bacopa Extract RS being used, identify the retention times of the peaks corresponding to different triterpene glycosides. The approximate relative retention times of the different triterpene glycosides are provided in the following table.

Analyte	Relative Retention Time
Bacopaside I	0.73
Bacoside A ₃	1.00
Bacopaside II	1.04
The jujubogenin isomer of bacopasaponin C	1.15
Bacopasaponin C	1.22

Separately calculate the percentages of bacopaside I, bacoside A₃, bacopaside II, jujubogenin isomer of bacopasaponin C, and bacopasaponin C in the portion of Powdered Bacopa Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response for each triterpene glycoside from the *Sample solution*

r_S = peak response for bacoside A₃ in *Standard solution A*

C_S = concentration of USP Bacoside A₃ RS in *Standard solution A* (mg/mL)

C_U = concentration of Powdered Bacopa Extract in the *Sample solution* (mg/mL)

F = conversion factor for each analyte: 1.00 for bacoside A₃, 1.03 for bacopaside I, 0.81 for bacopaside II, 0.99 for the jujubogenin isomer of bacopasaponin C, and 0.75 for bacopasaponin C

Acceptance criteria: Add the percentages of bacopaside I, bacoside A₃, bacopaside II, the jujubogenin isomer of bacopasaponin C, and bacopasaponin C: NLT 90.0%–NMT 110.0% of the labeled amount of triterpene glycosides is found on the dried basis.

IMPURITIES

Inorganic Impurities

• **HEAVY METALS**, *Method III* (231): NMT 20 ppm

Organic Impurities

• **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS

• **LOSS ON DRYING** (731): Dry 1.0 g of Powdered Bacopa Extract at 105° for 3 h: it loses NMT 5% of its weight.

• **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined molds and yeasts count does not exceed 10³ cfu/g.

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

• **OTHER REQUIREMENTS:** It meets the requirements of the test for *Residual Solvents* under *Botanical Extracts* (565).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. It meets other labeling requirements under *Botanical Extracts* (565).

• **USP REFERENCE STANDARDS** (11)

USP Bacoside A₃ RS

USP Powdered Bacopa Extract RS

Beta Carotene—see *Beta Carotene General Monographs***Beta Carotene Capsules**—see *Beta Carotene Capsules General Monographs***Beta Carotene Preparation****DEFINITION**

Beta Carotene Preparation is a combination of beta carotene with one or more inert substances. It may be in a solid or a liquid form. It contains NLT 95.0% and NMT 130.0% of the labeled amount of total beta carotene ($C_{40}H_{56}$) on the anhydrous basis. It contains NLT 95.0% of all-*trans*-beta carotene in the total beta carotene content.

IDENTIFICATION

- **A.** **Sample solution:** Transfer 5.0 mL of *Sample stock solution A* or *Sample stock solution B* from the test for *Content of Beta Carotene* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Pass the solution through a membrane filter of 0.45- μ m pore size.
Analysis: Record the UV-Vis spectrum from 300–600 nm.
Acceptance criteria: The *Sample solution* shows a shoulder at about 427 nm, an absorption maximum at about 455 nm, and another maximum at about 483 nm. The absorbance ratio A_{455}/A_{483} is between 1.14 and 1.18.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Beta Carotene*.

COMPOSITION• **CONTENT OF BETA CAROTENE**

[NOTE—Use low-actinic glassware.]

Mobile phase: Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask, and dissolve with 20 mL of 2-propanol. Add 0.2 mL of *N*-ethyldiisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach to room temperature, and dilute with methanol to volume.

Diluent: 50 μ g/mL of butylated hydroxytoluene in alcohol

System suitability solution: Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water, 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume and sonicate for 5 min. Cool to room temperature, pass the suspension through a membrane filter of 0.45- μ m pore size, and use the clear filtrate.

Standard stock solution: 60 μ g/mL of USP Beta Carotene RS in tetrahydrofuran

Standard solution A: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of tetrahydrofuran, and dilute with *Diluent* to volume. The concentration of the all-*trans*-beta carotene in this solution will be determined by the spectrophotometric procedure using *Standard solution B* as follows.

Standard solution B: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Prepare in triplicate.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 457 nm

Cell path: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Standard solution B*

Calculate the concentration of total beta carotene (mg/mL) as all-*trans*-beta carotene ($C_{40}H_{56}$) in *Standard solution B*.

$$\text{Result} = A/F$$

A = average absorbance of the three preparations of *Standard solution B*

F = absorptivity of pure all-*trans*-beta carotene in cyclohexane, 250.5

Sample stock solution A (for solid Beta Carotene Preparations): Transfer an amount of Beta Carotene Preparation equivalent to 10 mg of beta carotene to a 250-mL volumetric flask. Add 250 mg of butylated hydroxytoluene, 0.5 mL of alkaline Protease R, and 15 mL of water. Tilt the flask gently to wet the entire contents. Sonicate the solution in an ultrasonic bath at about 50° for 30 min, and swirl at 10 min intervals. Add 100 mL of alcohol to the warm suspension and shake vigorously. Add 135 mL of methylene chloride and shake again. Let the mixture stand in the dark until it reaches room temperature (about 2 h). Dilute with methylene chloride to volume, shake vigorously, and allow solids to settle in the dark.

Sample stock solution B (for liquid Beta Carotene suspensions in oil Preparations): Transfer an amount of Beta Carotene Preparation equivalent to 20 mg of beta carotene to a 250-mL volumetric flask. Add 250 mg of butylated hydroxytoluene, 120 mL of methylene chloride, and 100 mL of alcohol. Shake the flask until the sample is completely dissolved or suspended. Let the mixture stand in the dark until it reaches room temperature (about 2 h). Add methylene chloride to volume and shake again vigorously.

Sample solution: Transfer 5.0 mL of *Sample stock solution A* or *Sample stock solution B* into a 50-mL volumetric flask, and dilute with a mixture of methylene chloride and *Diluent* (1:1) to volume. Pass through a membrane filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 448 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L68

Column temperature: 30°

Flow rate: 0.6 mL/min

Injection size: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution A*

The approximate relative retention times of the components in the *System suitability solution* are listed in *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor
All- <i>trans</i> -alpha carotene	0.93	1.1
All- <i>trans</i> -beta carotene	1.00	1
9- <i>cis</i> -Beta carotene	1.07	1
13- <i>cis</i> -Beta carotene	1.17	1.2
15- <i>cis</i> -Beta carotene	1.21	1.4

Suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the

Reference Chromatogram provided with the USP Beta Carotene System Suitability RS being used.

Resolution: NLT 1.5 between beta carotene and alpha carotene and between beta carotene and 9-*cis*-beta carotene, *System suitability solution*

Tailing factor: NMT 2.0 for the beta carotene peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the beta carotene peak from replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*

[NOTE—The relative response factors for 13-*cis*-beta carotene and 15-*cis*-beta carotene are 1.2 and 1.4, respectively.]

Record the chromatograms, and identify the peaks of the relevant analytes of the *Sample solution* by comparing with those of the *System suitability solution*. Measure the peak-area responses. Calculate the percentage total beta carotene in the portion of Preparation taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = [(peak area of all-*trans*-beta carotene) + (peak area of 9-*cis*-beta carotene) + (peak area of 13-*cis*-beta carotene \times 1.2) + (peak area of 15-*cis*-beta carotene \times 1.4) + (sum of peak area of other *cis*-isomers of beta carotene)] in the *Sample solution*

r_S = peak area of all-*trans*-beta carotene in *Standard solution A*

C_S = concentration of all-*trans*-beta carotene in *Standard solution A* as determined by spectrometric procedure (mg/mL)

C_U = nominal concentration of Preparation in the *Sample solution* (mg/mL)

Calculate the percentage of all-*trans*-beta carotene in the portion of Preparation taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of all-*trans*-beta carotene in the *Sample solution*

r_S = peak area of all-*trans*-beta carotene in *Standard solution A*

C_S = concentration of all-*trans*-beta carotene in *Standard solution A* as determined by spectrometric procedure (mg/mL)

C_U = nominal concentration of Preparation in the *Sample solution* (mg/mL)

Acceptance criteria: The Preparation contains 95.0%–130% of the labeled amount of total beta carotene, calculated as (C₄₀H₅₆) on the anhydrous basis, and NLT 95.0% of all-*trans*-beta carotene in the total beta carotene content.

• ALPHA CAROTENE AND OTHER RELATED COMPOUNDS

Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the test for *Content of Beta Carotene*.

Analysis

Sample: *Sample solution*

Injection size: 20 μ L

Calculate the percentage of alpha carotene and other individual related compounds relative to total beta carotene in the portion of Preparation taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of alpha carotene or other individual related compounds

r_T = sum of the peak areas of all the peaks

Acceptance criteria

Alpha carotene: NMT 1.0%

Any other individual related compound: NMT 1.0%

Total related compounds (including alpha carotene): NMT 5.0%

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 2.0%

• **HEAVY METALS, Method II** (231): NMT 10 ppm

SPECIFIC TESTS

• **WATER DETERMINATION, Method I** (921): NMT 8.0% for solid preparations. NMT 1.0% for liquid preparations.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tightly sealed, light- and oxygen-resistant containers. Store in a cool place.

• **LABELING:** The label states the name and content of any carriers and antioxidants added to the formulation, and the content of total carotenoids as beta carotene.

• **USP REFERENCE STANDARDS** (11)

USP Beta Carotene RS

(*all-E*)-1,1'-(3,7,12,16-Tetramethyl-1,3,5,7,9,11,13,15,17-octadecanonaene-1,18-diyl)bis[2,6,6-trimethylcyclohexene].

USP Beta Carotene System Suitability RS

Beta Glucan

DEFINITION

Beta Glucan is obtained by extraction from the cell wall of fermented and thermally processed Baker's yeast (*Saccharomyces cerevisiae*). It is comprised mainly of β -(1,3)/(1,6) branched glucan polymers. Small amounts of β -(1,6)-glucan and chitin are also expected to be present in the final product. It contains NLT 70% beta glucan, calculated as glucose after enzymatic hydrolysis, on the dried basis.

IDENTIFICATION

• **NUCLEAR MAGNETIC RESONANCE** (761)

Standard solution: Dissolve 10 mg of USP Beta Glucan RS in 0.6 mL of dimethyl sulfoxide-*d*₆, and heat at 100° for 1 h. Then add 0.1 mL of D₂O, mix the solution, and transfer to an NMR tube.

Sample solution: Dissolve 10 mg of Beta Glucan in 0.6 mL of dimethyl sulfoxide-*d*₆, and heat at 100° for 1 h. Then add 0.1 mL of D₂O, mix the solution, and transfer to an NMR tube.

Analysis: Collect ¹H NMR spectra at 80°, and compare individual resonances from the *Sample solution* to those from the *Standard solution*. The major signals associated with Beta Glucan are shown in *Table 1*.

Table 1

¹ H NMR Major Signals	USP Beta Glucan RS
H-1 (1,3)-glucan	4.52, d, J = 7.5 Hz, 1H
H-2, 4, and 5 (1,3-)	3.27–3.33, m, 3H
H-3 and 6b (1,3-)	3.45–3.48, m, 2H
H-6a (1,3-)	3.71, d, J = 11 Hz, 1H
H-1 (1,6)-glucan	4.27, d, J = 7.7 Hz, 1H

Integrate the area under the peaks five times for each sample, and average. Determine the relative percentage of (1,6) linked glucan in the portion of Beta Glucan taken:

$$\text{Result} = \{A/(A + B)\} \times 100$$

A = integration values for the signal at 4.27 ppm, corresponding to H-1 from (1,6) glucan

B = integration values for the signal at 4.52 ppm corresponding to H-1 (1,3) glucan

Acceptance criteria: The ^1H spectrum of the *Sample solution* exhibits a chemical shift pattern with signal locations and relative intensities that correspond to those of the *Standard solution*. In addition, the relative percentage of (1,6) linked glucan is 10%–18% of the total linkages.

COMPOSITION

• CONTENT OF BETA GLUCAN

Buffer A: Dissolve 11.12 g of glacial acetic acid in approximately 900 mL of water. Adjust the solution with 20% sodium hydroxide solution to a pH of 5, and dilute with water to 1000 mL.

Buffer B: Dissolve 69.6 mL of glacial acetic acid in approximately 800 mL of water. Adjust with 20% sodium hydroxide solution to a pH of 3.8, and dilute with water to 1000 mL.

Buffer C: Dissolve 12.12 g of tris(hydroxymethyl)-aminomethane (TRIS), 11.69 g sodium chloride, and 4.16 g of ethylenediaminetetraacetic acid (EDTA) tetrasodium salt dihydrate in approximately 900 mL of water. Adjust with concentrated hydrochloric acid or 20% sodium hydroxide solution to a pH of 7.5, and dilute with water to 1000 mL. [NOTE—*Buffer C* can be stored for 1 year at 2°–8°.]

Buffer D¹: Transfer 45.287 g of dibasic potassium phosphate, 30.382 g of *p*-hydroxybenzoic acid, and 4 g of sodium azide into a 1000-mL volumetric flask, and carefully add 800 mL of water. Mix with a stirring bar and mild heat until completely dissolved. Allow the solution to cool, adjust with 16.7% potassium hydroxide solution to a pH of 7.4, and dilute with water to volume. [NOTE—Store *Buffer D* in an amber bottle with an expiration date of 3 years at 4°.]

Lyticase solution: Prepare the required volume of lyticase from *Arthrobacter luteus*² at a concentration of 10 U/ μL by dissolving the quantity stated by the manufacturer (U/mg) in a solution containing 10% (v/v) *Buffer C*. [NOTE—Unused solution can be stored at NMT –15° with an expiration date of 1 year. Every time a different lot of lyticase is used, the concentration of lyticase solution required needs to be qualified.]

(1,6)-Glucanase solution: 1 U/300 μL solution of lyophilized (1,6)-glucanase³ in *Buffer A*. [NOTE—Solids may not fully dissolve; therefore, this solution should be handled as a homogeneous suspension. The solution is stable for at least 60 days at NMT –15°.]

Polishing enzyme mix: Mix 2000 U of *exo*-beta-glucanase⁴ and 400 U of beta-glucosidase⁵ in 100.0 mL of *Buffer A*. A premix of the enzymes may be used as an alternative⁶. [NOTE—Store on ice during the procedure, and for use in a same-day assay. Unused *Polishing enzyme mix* can be refrozen once at NMT –15° with an expiration date of 2 years.]

Glucose oxidase/oxidase reagent: Dissolve the contents of the Glucose Determination Reagent⁷ in 1 L of water containing 50 mL of *Buffer D*. [NOTE—Store the reagent in an amber bottle, and label with an expiration date of 3 months at a temperature between 2° and 8° or 1 year at NMT –17°. Minimize the time spent at room temperature.]

Sample solution: Transfer 15–20 mg of Beta Glucan into a 16- × 100-mm glass vial. Place the vial in an ice bath. Add a 0.4-mL aliquot of cold potassium hydroxide (1 in 6) while mixing on a vortex mixer to disperse the

powder. Return the vial to the ice bath. Continue cycling through mixing on a vortex mixer and placing the vials in the ice bath for 20 min. The mixture should turn into a homogenous, translucent dispersion.

Standard solution: Proceed as directed for the *Sample solution* except replace Beta Glucan with USP Beta Glucan RS. [NOTE—Prepare the *Sample solution* and *Standard solution* in triplicate. It is critical for the success of the assay that the sample is well dispersed.]

Lyticase digestion: Upon removal of all vials containing the *Sample solution* or the *Standard solution* from the ice bath, add 1.6 mL of *Buffer B* and 600 μL of *Lyticase solution* to each vial. Incubate the mixture at 50° for 12–18 h, and cool to room temperature.

(1,6)-Glucanase digestion: After cooling of all vials, remove a 130- μL aliquot of each vial, and digest further by adding 25 μL of 16.7% potassium hydroxide solution and 300 μL of (1,6)-*Glucanase solution*. Incubate vials at 80° for 15 min, and cool to room temperature.

Beta glucanase/glucosidase digestion: After cooling of all vials, add 390 μL of the *Polishing enzyme mix* to each vial, and incubate the vials at 40° for 1 h. Cool them to room temperature, centrifuge, and transfer 50- μL aliquots (in duplicate) to new vials.

Enzyme blank solution: Prepare enzyme blanks in triplicate by combining all the reagents used during the digestion steps except the *Sample solution* or *Standard solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 510 nm

Analysis: Dilute the 50- μL aliquots obtained after the *Beta glucanase/glucosidase digestion* with 50 μL of water, and then add 3 mL of *Glucose oxidase/oxidase reagent*. Incubate the vials for 20 min at 40°. Determine the absorbance of each vial of the *Sample solution* or *Standard solution* against the *Enzyme blank solution*. Prepare a standard curve using the absorbance of similarly treated series of glucose standards (0, 0.1, 0.25, 0.5, and 1.0 mg/mL). From the slope of the standard curve and the absorbance of the digested *Sample solution* and *Standard solutions*, determine the concentration, C , in mg/mL, of liberated glucose in the cuvette:

$$\text{Result} = (A_s - A_b) / \text{slope}$$

A_s = average absorbance of the sample or USP Beta Glucan RS

A_b = average absorbance of the *Enzyme blank solution*

Calculate the percentage of beta glucan as glucose in the portion of Beta Glucan taken:

$$\text{Result} = 100 \times C / \{[(WT_s/F1) \times (F2/F3)]/2\}$$

WT_s = original weight of the sample or USP Beta Glucan RS (mg)

$F1$ = total volume in the vial during *Lyticase digestion*, 2.6 mL

$F2$ = volume of the sample or USP Beta Glucan RS transferred to a new vial during (1,6)-*Glucanase digestion*, 0.130 mL

$F3$ = total volume during *Beta glucanase/glucosidase digestion*, 0.845 mL

Acceptance criteria: NLT 70% beta glucan, calculated as glucose after enzymatic hydrolysis, on the dried basis

• CONTENT OF PROTEIN

Sample: 1.0 g of Beta Glucan

Analysis: Proceed as directed in *Nitrogen Determination* (461), and multiply the nitrogen content by 6.25.

¹ This buffer is also available as Bottle #3 of the K-YBGL kit (Megazyme), or Bottle #1 of the GOPOD kit (Megazyme).

² Lyticase from *Arthrobacter luteus*, Sigma L4025, or equivalent.

³ Commercially available as Pustulanase, Cel136, Prokzyme, or equivalent.

⁴ E-EXBGL 200 U/mL, 200 U/bottle, Megazyme, or equivalent.

⁵ 200 U/bottle, Megazyme, or equivalent.

⁶ E-EXBGOS, Megazyme, or equivalent.

⁷ Bottle #4 of K-YBGL kit, or Bottle #2 of GOPOD kit, Megazyme, or equivalent.

Acceptance criteria: NMT 10.0%

• **CONTENT OF FAT**

Sample: 2 g of Beta Glucan, previously dried

Analysis: Transfer the *Sample* to an extraction thimble, and mix with an equivalent quantity of dry, clean sand. Place a fat-free cotton or glass wool plug on top of the thimble. Place the thimble in a continuous-extraction apparatus provided with a tared collection flask. Pour 75 mL of solvent hexane through the sample into the collection flask. Extract at a condensation rate of 5–6 drops/s for 4 h, then at a rate of 2–3 drops/s for the next 16 h. Detach the collection flask, carefully evaporate the solvent, and dry the collection flask and its contents in a drying oven at 100° for 30 min to constant weight. Calculate the percentage of the extract (crude fat) in the portion of Beta Glucan taken.

Acceptance criteria: NMT 20.0%

CONTAMINANTS

• **ELEMENTAL IMPURITIES—PROCEDURES (233)**

Acceptance criteria

Arsenic: NMT 0.5 µg/g

Cadmium: NMT 0.5 µg/g

Lead: NMT 0.5 µg/g

- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic bacterial count does not exceed 2×10^4 cfu/g, the total combined molds and yeasts count does not exceed 2.5×10^1 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10 cfu/g.

- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

• **GLYCOGEN**

Buffer B: Prepare as directed in *Content of Beta Glucan*.

Amyloglucosidase/invertase solution⁸: A mixture of 1630 U/mL of amyloglucosidase and 500 U/mL of invertase in glycerol solution (50% v/v)

Sample: 100 mg

Analysis: Transfer the *Sample* in triplicate into individual 16- × 150-mm glass screw-cap vials. Place the vials in an ice bath, and add to each vial a 2-mL aliquot of cold potassium hydroxide (1 in 6) while mixing on a vortex mixer to disperse the powder. Return the vial to the ice bath. Continue cycling through mixing on a vortex mixer and placing vials in the ice bath for 20 min. The mixture should turn into a homogenous, translucent dispersion. Add 8 mL of *Buffer B*. Mix thoroughly on a vortex mixer, and immediately add 200 µL of *Amyloglucosidase/invertase solution*, and mix again on a vortex mixer. Incubate the mixture at 40° for 30–35 min. Cool to room temperature. Mix again on a vortex mixer, transfer to a suitable centrifuge tube, and centrifuge until a clear supernatant is obtained. Transfer duplicate 50-µL aliquots of supernatant into new vials, and proceed as directed for the *Analysis* in *Content of Beta Glucan*.

Acceptance criteria: NMT 1.0%

• **MANNOSE**

Solution A: 100% purified water

Solution B: 956 mM sodium hydroxide

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	36.0	64.0
15.0	36.0	64.0

⁸ Alternatively, Bottle #2 of K-YBGL kit (Megazyme, or equivalent) could be used directly.

Table 2 (Continued)

Time (min)	Solution A (%)	Solution B (%)
35.0 (sample injection)	59.4	40.6
80.0	59.4	40.6

[NOTE—The run time typically required is 80 min.]

Internal standard solution: 0.8 mg/mL of USP Inositol RS in water

Sample solution: Weigh 2.0–4.0 mg of Beta Glucan in duplicate into vials with stir bars. Add 500 µL of pure trifluoroacetic acid (TFA), and allow the mixture to form a uniform dispersion by stirring for 1 h at room temperature. Incubate in a 80° water bath for 2 h with stirring, and then cool to room temperature. Add 100 µL of the *Internal standard solution* to each vial, and incubate with stirring in a boiling water bath for 15 min. Cool again to room temperature, then add 1.07 mL of water to each vial, and incubate with stirring in a boiling water bath for 1 h. Cool the solutions to room temperature, and dry overnight on a SpeedVac, or equivalent, at low heat with the cryopumping system off. Dissolve the dried preparation in 2.5 mL of deionized water, and pass through a PTFE syringe filter of 0.2-µm pore size. Dilute with an equal volume of water before injection.

Standard solutions: Prepare a 4-mg/mL solution of USP Dextrose RS and a 80-µg/mL solution of USP Mannose RS. Separately transfer aliquots of these solutions to individual vials (see *Table 3*). Prepare each standard in duplicate, and freeze-dry them. Treat the freeze-dried vials as directed in the *Sample solution*, beginning with “Add 500 µL of pure trifluoroacetic acid”.

Table 3

Standard Identification Number	µL/Vial of 4 mg/mL Glucose	Content of Glucose (µg)	µL/Vial of 80 µg/mL Mannose	Content of Mannose (µg)
0	0	0	0	0
1	100	400	25	2
2	200	800	50	4
3	300	1200	100	8
4	500	2000	200	16

System suitability

Sample: *Standard Identification #5*

[NOTE—The relative retention times for inositol, mannose, and glucose are 0.68, 0.95 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between mannose and glucose

Analysis

Samples: *Standard solutions* and *Sample solution*

Calculate the ratios of the peak area response of the glucose and mannose to the peak area response of the internal standard from the *Standard solutions*. Make two standard response lines by plotting the peak area response ratio versus the amount (µg) of the glucose and mannose in the *Standard solutions*. Calculate the ratio of the peak area response of the glucose and mannose to the peak area response of the internal standard from the *Sample solution*. From the calculated ratios of peak responses for glucose and mannose and their respective standard response lines, determine the content of glucose, C_G , and mannose, C_M , both in µg, in the *Sample solution*.

Calculate the percentage of mannose in the portion of Beta Glucan taken:

$$\text{Result} = C_M / (C_M + C_G) \times 100$$

C_M = content of mannose in the *Sample solution* from the mannose regression line (µg)

C_G = content of glucose in the *Sample solution* from the glucose regression line (µg)

Acceptance criteria: NMT 1.0% mannose, as a function of total hexose recovered (glucose and mannose)

• **RESIDUE ON IGNITION** (281): NMT 2.5%

• **LOSS ON DRYING** (731)

Sample: 1 g

Analysis: Dry the *Sample* at 105° for 3 h.

Acceptance criteria: NMT 8.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight and light-resistant containers.

• **USP REFERENCE STANDARDS** (11)

USP Beta Glucan RS

USP Dextrose RS

USP Inositol RS

USP Mannose RS

Powdered Bilberry Extract

DEFINITION

Powdered Bilberry Extract is prepared from the ripe fruits of *Vaccinium myrtillus* L. (Fam. Ericaceae) using suitable solvents such as alcohol, methanol, or water or mixtures of these solvents. The ratio of the starting plant material to Powdered Extract is between 153:1 and 76:1. It contains NLT 36.0% of anthocyanosides, calculated as cyanidin-3-O-glucoside chloride, and NMT 1.0% of anthocyanidins, calculated as cyanidin chloride; both are calculated on the anhydrous basis.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 4 mg/mL of USP Powdered Bilberry Extract RS in methanol. Centrifuge, and use the clear supernatant.

Sample solution: 4 mg/mL of Powdered Bilberry Extract in methanol. Centrifuge, and use the clear supernatant.

Adsorbent: Use suitable thin-layer chromatographic plates coated with a layer of cellulose.

Application volume: 10 µL

Developing solvent system A: Glacial acetic acid, hydrochloric acid, and water (15:3:82)

Developing solvent system B: Glacial acetic acid and water (6:4)

Analysis

Samples: *Standard solution* and *Sample solution*

Use a saturated chamber. Develop the chromatograms using *Developing solvent system A*, and dry the plate with the aid of a current of warm air. Develop the chromatograms in the same direction using *Developing solvent system B*. Examine the plate under visible light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits three main red bands with R_f values of approximately 0.55, 0.65, and 0.70 that are similar in position and color to the corresponding main bands in the chromatogram of the *Standard solution*.

- **B.** The retention times of the anthocyanoside peaks in the chromatogram of the *Sample solution* correspond to those in the chromatogram of *Standard solution C*, as obtained in the test for *Content of Anthocyanosides and Anthocyanidins*. The peaks due to delphinidin-3-O-galactoside chloride and delphinidin-3-O-glucoside chloride are the most intense peaks and are of similar intensity, and each is more intense than the peak due to cyanidin-3-O-glucoside chloride. The peaks due to cyanidin-3-O-galactoside chloride, delphinidin-3-O-arabinoside chloride, and cyanidin-3-O-glucoside chloride are of similar intensity. Each of the remaining anthocyanoside peaks is of lower intensity than the peak due to cyanidin-3-O-glucoside chloride.

COMPOSITION

• **CONTENT OF ANTHOCYANOSIDES AND ANTHOCYANIDINS**

Solvent: Methanol and hydrochloric acid (49:1)

Diluent: 85% phosphoric acid and water (1:9)

Solution A: Formic acid and water (1:9)

Solution B: Acetonitrile, methanol, formic acid, and water (45:45:20:80)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	93	7
35	75	25
45	35	65
46	0	100
50	0	100
51	93	7
60	93	7

Standard stock solution A: 0.4 mg/mL of USP Cyanidin-3-O-glucoside Chloride RS in *Solvent*. [NOTE—Dissolve using sonication.]

Standard solution A: 0.08 mg/mL of USP Cyanidin-3-O-glucoside Chloride RS from *Standard stock solution A* in *Diluent*. [NOTE—This solution is stable for 48 h at 4°.]

Standard stock solution B: 0.5 mg/mL of USP Cyanidin Chloride RS in *Solvent*. [NOTE—Dissolve using sonication.]

Standard solution B: 0.01 mg/mL of USP Cyanidin Chloride RS from *Standard stock solution B* in *Diluent*. [NOTE—This solution is stable for 36 h at 4°]

Standard solution C: Transfer 125 mg of USP Powdered Bilberry Extract RS to a 100-mL volumetric flask, add 25 mL of *Solvent*, sonicate to dissolve, and dilute

with *Diluent* to volume. [NOTE—This solution is stable for 48 h at 4°.]

Sample solution: Transfer 125 mg of Powdered Bilberry Extract to a 100-mL volumetric flask, add 25 mL of *Solvent*, sonicate to dissolve, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

[NOTE—Use deactivated silanized HPLC vials.]

Mode: LC

Detector: UV-Vis 535 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Temperature

Refrigerated autosampler: 4°

Column: 30 ± 1°

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution A* and *Standard solution C*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution C* is similar to the Reference Chromatogram provided with USP Powdered Bilberry Extract RS.

Resolution: NLT 0.8 between the delphinidin-3-O-arabinoside, malvidin-3-O-galactoside, and petunidin-3-O-arabinoside peaks and NLT 1.0 for other components, *Standard solution C*

Tailing factor range: 0.8–2.0 for the cyanidin-3-O-glucoside chloride peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for cyanidin-3-O-glucoside chloride peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Using the chromatogram of *Standard solution C* and the Reference Chromatogram, identify the retention times of the peaks corresponding to the different anthocyanosides and anthocyanidins. The approximate relative retention times, relative to cyanidin-3-O-glucoside chloride, are provided for the anthocyanosides in *Table 2* and for the anthocyanidins in *Table 3*.

Separately calculate the percentages of each anthocyanoside (see *Table 2*) in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each of the anthocyanosides in the *Sample solution*

r_S = peak response of cyanidin-3-O-glucoside chloride in *Standard solution A*

C_S = concentration of USP Cyanidin-3-O-glucoside Chloride RS in *Standard solution A* (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Table 2

Analyte	Relative Retention Time
Delphinidin-3-O-galactoside chloride	0.61
Delphinidin-3-O-glucoside chloride	0.73
Cyanidin-3-O-galactoside chloride	0.84
Delphinidin-3-O-arabinoside chloride	0.86
Cyanidin-3-O-glucoside chloride	1.00
Petunidin-3-O-galactoside chloride	1.08
Cyanidin-3-O-arabinoside chloride	1.11
Petunidin-3-O-glucoside chloride	1.24
Peonidin-3-O-galactoside chloride	1.36
Petunidin-3-O-arabinoside chloride	1.39

Table 2 (Continued)

Analyte	Relative Retention Time
Peonidin-3-O-glucoside chloride	1.55
Malvidin-3-O-galactoside chloride	1.58
Peonidin-3-O-arabinoside chloride	1.67
Malvidin-3-O-glucoside chloride	1.76
Malvidin-3-O-arabinoside chloride	1.91

Separately calculate the percentages of anthocyanidins (see *Table 3*) in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each of the anthocyanidins in the *Sample solution*

r_S = peak response of cyanidin chloride in *Standard solution B*

C_S = concentration of USP Cyanidin Chloride RS in *Standard solution B* (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Table 3

Analyte	Relative Retention Time
Delphinidin chloride	1.28
Cyanidin chloride	1.82
Petunidin chloride	2.08
Peonidin chloride	2.27
Malvidin chloride	2.30

Acceptance criteria

Sum of all anthocyanosides: NLT 36.0% on the anhydrous basis

Sum of all anthocyanidins: NMT 1.0% on the anhydrous basis

CONTAMINANTS

• **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

• **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements

• **MICROBIAL ENUMERATION TESTS** (2021)

Total aerobic microbial count: NMT 10⁴ cfu/g

Total combined yeasts and molds count: NMT 10³ cfu/g

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

• **ACID INSOLUBLE FRACTION**

Sample: 5 g of Powdered Extract finely ground

Analysis: Transfer about 1 g to a 500-mL flask, add 200 mL of 0.1 N hydrochloric acid, and shake vigorously for 2 h. Pass the solution through a previously tared sintered-glass filter, wash the flask with 30 mL of 0.1 N hydrochloric acid, and transfer the washings to the filter. Wash the filter with 30 mL of 0.1 N hydrochloric acid in 5-mL portions. Dry the filter for 3 h at 105°, cool in a desiccator, and weigh. Calculate the percentage of the acid insoluble fraction.

Acceptance criteria: NMT 5%

• **WATER DETERMINATION**, *Method Ia* <921>: NMT 4.5%, determined on 0.5 g

• **RESIDUE ON IGNITION** <281>: NMT 3.0%, determined on 1.0 g

• **BOTANICAL EXTRACTS**, *Residual Solvents* <565>: Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. It meets other labeling requirements under *Botanical Extracts* (565).
- **USP REFERENCE STANDARDS** (11)
 - USP Powdered Bilberry Extract RS
 - USP Cyanidin Chloride RS
 - USP Cyanidin-3-O-glucoside Chloride RS

Biotin—see *Biotin General Monographs*

Black Cohosh

DEFINITION

Black Cohosh consists of the dried rhizome and roots of *Actaea racemosa* L. [*Cimicifuga racemosa* (L.) Nutt.] (*Ranunculaceae*). It is harvested in the summer. It contains NLT 0.4% of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein¹ (C₃₇H₅₆O₁₀) on the dried basis.

IDENTIFICATION• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution A: 100 mg/mL of USP Powdered Black Cohosh Extract RS in methanol

Standard solution B: 1 mg/mL each of USP Actein RS, USP 23-*epi*-26-Deoxyactein RS, and isoferulic acid in methanol

Sample solution: Transfer 5 g of powdered Black Cohosh to a screw-capped centrifuge tube, add 10 mL of a mixture of alcohol and water (7:3), and heat on a steam bath for 10 min. Centrifuge, and use the clear supernatant.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 µm (TLC plates)

Application volume: 10 µL

Developing solvent system: Use the upper phase of a mixture of butyl alcohol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5). [NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved about 15 cm, and dry the plate with the aid of a current of air.

Acceptance criteria: Examine the plate under UV light at 365 nm. The chromatogram of the *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. In the upper third of the plate, the *Sample solution* exhibits a blue fluorescent zone at the level of the zone due to isoferulic acid of *Standard solution B*. Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight. The *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. *Standard solution B* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein. The *Sample solution* exhibits several greenish-brown spots in the lower third of the plate and several violet zones above; two of these violet zones occur at *R_f* values similar to those due to actein and 23-*epi*-26-deoxyactein of *Standard solution B*.

• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)

Standard solution A: 0.5 mL of *Standard solution A* prepared in *Identification test A*, diluted with methanol to 2 mL

Standard solution B: 1.0 mL of *Standard solution B* prepared in *Identification test A*, diluted with methanol to 5 mL

Sample solution: Transfer 0.5 g of powdered Black Cohosh to a screw-capped tube, add 5 mL of methanol, sonicate for 10 min, and filter into a 10-mL volumetric flask. Wash the residue on the filter paper four times, using 1 mL of methanol for each washing; add the washings to the volumetric flask; and dilute with methanol to volume.

Application volume: 2 µL as an 8-mm band

Developing solvent system: Toluene, ethyl formate, and formic acid (5:3:2)

Spray reagent: Proceed as directed for *Identification test A*.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved about two-thirds of the length of the plate, and dry the plate with the aid of a current of air.

Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight.

Acceptance criteria: The *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. *Standard solution B* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein at *R_f* values of about 0.5 and 0.4, respectively. The *Sample solution* exhibits zones similar in color and *R_f* values to those due to actein and 23-*epi*-26-deoxyactein of *Standard solution B*.

- **C.** The *Sample solution* exhibits peaks for cimicracemoside A, 26-deoxycimicifugoside, (26S)-actein, 23-*epi*-26-deoxyactein, cimigenol-arabinside, and cimigenol-xyloside at retention times corresponding to these compounds in the *Standard solution*, as obtained in the test for *Content of Triterpene Glycosides*. The ratio of the peak areas of cimigenol-arabinside to cimigenol-xyloside is NLT 0.4 (distinction from *Cimicifuga foetida*).

COMPOSITION• **CONTENT OF TRITERPENE GLYCOSIDES**

Standard solution: Dissolve a quantity of USP Powdered Black Cohosh Extract RS in methanol with shaking for 1 min, and dilute with methanol to obtain a solution having a known concentration of 30 mg/mL. Pass through a membrane filter of 0.45-µm or finer pore size.

23-*epi*-26-Deoxyactein standard solutions: Dissolve USP 23-*epi*-26-Deoxyactein RS in methanol with shaking for 1 min. Dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations of 500, 100, 50, 25, and 12.5 µg/mL. Pass through a membrane filter of 0.45-µm or finer pore size.

System suitability solution: 0.1 mg/mL each of USP Actein RS and USP 23-*epi*-26-Deoxyactein RS in methanol

Sample solution: Accurately weigh about 750 mg of ground plant material, and place in a 20-mL polytetrafluoroethylene capped centrifuge tube. Pipet 15 mL of methanol, sonicate for 30 min, centrifuge, and transfer the supernatant to an evaporation flask. Repeat the extraction twice. Evaporate the combined extracts under vacuum at 45°–50°. Dissolve the residue in methanol, and quantitatively transfer to a 10-mL volumetric flask. Dilute with methanol to volume, and pass through a membrane filter of 0.45-µm or finer pore size.

¹ 23-*epi*-26-Deoxyactein is sometimes referred to as 27-deoxyactein.

Solution A: 0.05% trifluoroacetic acid in water

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Water (%)	Solution A (%)	Solution B (%)
0	0	80	20
8	0	80	20
15	68	0	32
55	36	0	64
65	5	0	95
70	5	0	95
85	0	80	20

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: Evaporative light-scattering

[NOTE—The detector is set up according to the manufacturer's instruction in order to achieve a signal-to-noise ratio of NLT 10 for the 12.5-μg/mL 23-*epi*-26-Deoxyactein standard solution.]

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 35°

Flow rate: 1.6 mL/min

Injection size: 20 μL

System suitability

Samples: System suitability solution, Standard solution, and 100-μg/mL 23-*epi*-26-Deoxyactein standard solution

Suitability requirements

Chromatogram similarity: The chromatogram of the Standard solution is similar to the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS being used.

Resolution: NLT 1.0 between the (26S)-actein and the 23-*epi*-26-deoxyactein peaks, System suitability solution

Tailing factor: NMT 2.0 for the 23-*epi*-26-deoxyactein peak, 100-μg/mL 23-*epi*-26-Deoxyactein standard solution

Relative standard deviation: NMT 2.0% of the logarithm of the area response of the 23-*epi*-26-deoxyactein peak in repeated injections, 100-μg/mL 23-*epi*-26-Deoxyactein standard solution

Analysis

Samples: System suitability solution, Standard solution, 23-*epi*-26-Deoxyactein standard solutions, and Sample solution

Using the chromatogram of the Standard solution and the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS, identify the retention times of the peaks corresponding to the triterpene glycosides. The approximate relative retention times of the triterpene glycosides are provided in Table 2.

Table 2

Compound	Relative Retention Time
Cimicifugoside H-1	0.61
Cimiracemoside A	0.78
(26R)-Actein	0.94
26-Deoxycimicifugoside	0.96
(26S)-Actein	0.98
23- <i>epi</i> -26-Deoxyactein	1.00
Acetyl-shengmanol-xyloside	1.03
Cimigenol-arabinoside	1.08
Cimigenol-xyloside (cimicifugoside)	1.13

Table 2 (Continued)

Compound	Relative Retention Time
26-Deoxyactein	1.22
25-Acetyl-cimigenol-arabinoside	1.60
(24S)-25-Acetyl-cimigenol-xyloside	1.64
25-O-Methyl-cimigenol-arabinoside	1.90
25-O-Methyl-cimigenol-xyloside	1.93

Plot the logarithms of the peak area responses versus the logarithms of the concentrations, in μg/mL, of the 23-*epi*-26-Deoxyactein standard solutions, and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is NLT 0.995. From the graphs so obtained, determine the concentration, C, in μg/mL, of the relevant analyte in the Sample solution. Separately calculate the percentages of cimicifugoside H-1, cimiracemoside A, (26R)-actein, 26-deoxycimicifugoside, (26S)-actein, 23-*epi*-26-deoxyactein, acetyl-shengmanol-xyloside, cimigenol-arabinoside, cimigenol-xyloside (cimicifugoside), 26-deoxyactein, 25-acetyl-cimigenol-arabinoside, (24S)-25-acetyl-cimigenol-xyloside, 25-O-methyl-cimigenol-arabinoside, and 25-O-methyl-cimigenol-xyloside as 23-*epi*-26-deoxyactein (C₃₇H₅₆O₁₀) in the portion of Black Cohosh taken:

$$\text{Result} = (V \times C) / (F \times W) \times 100$$

V = final volume of the Sample solution (mL)

C = concentration of the relevant analyte in the Sample solution (μg/mL)

F = factor to convert mg to μg, 1000 μg/mg

W = weight of Black Cohosh taken to prepare the Sample solution (mg)

Calculate the percentage of triterpene glycosides in the portion of Black Cohosh taken by adding all of the percentages calculated for the individual analytes.

Acceptance criteria: NLT 0.4% on the dried basis

CONTAMINANTS

- **HEAVY METALS <231>:** NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis <561>:** Meets the requirements
- **MICROBIAL ENUMERATION TESTS <2021>:** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 10⁵ cfu/g; the total combined molds and yeasts count does not exceed 10³ cfu/g; and the bile-tolerant Gram-negative bacteria count does not exceed 10³ cfu/g.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: The Black Cohosh rhizome is dark brown, longitudinally grooved, rough, strongly knotty, and somewhat curled and irregular. It is 15 cm long and up to 2.5 cm thick. The upper surface is covered with numerous round scars of the earlier stalks; laterally, it is clearly curled, and the lower surface is covered with thin, longitudinally grooved, dark brown, easily breakable roots. The fracture is horny and fibrous. The transverse cut shows a thin outer bark surrounding a ring of numerous pale, narrow wedges of vascular tissue alternating with dark medullary rays and a large central pith. Black Cohosh roots are dark brown, between 1 and 3 mm in diameter, brittle, nearly cylindrical or obtusely quadrangular, and longitudinally wrinkled. The fracture is short. The transverse cut shows a distinct cambium line separating a wide outer bark from a central region composed of three to six wedges of lignified xylem tissue united by their apices and separated by broad nonlignified medullary rays.

Microscopic: In a surface view, suberous epidermal cells are tabular with moderately thickened walls. The parenchymatous cortex is filled with starch. Xylem wedges are lignified and composed of numerous small vessels with bordered pits or reticulately thickened walls, thin-walled fibers, and xylem parenchyma. The parenchyma of the pith is unlignified. Medullary rays are filled with starch granules, which are spherical or polygonal and are mostly simple or two to three compounded but can be up to six compounded. Individual starch granules are between 3 and 15 μm in diameter, each with a somewhat central slit-shaped hilum.

 - USP 23-*epi*-26-Deoxyactein RS

Black Cohosh Fluidextract

DEFINITION

Black Cohosh Fluidextract is prepared from Black Cohosh by extraction with hydroalcoholic mixtures or isopropyl-alcohol–water mixtures. Each mL contains the extracted constituents of 1 g of the plant material. It contains NLT 90.0% and NMT 110.0% of the labeled amount of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($\text{C}_{37}\text{H}_{56}\text{O}_{10}$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
 - Standard solution A:** 100 mg/mL of USP Powdered Black Cohosh Extract RS in methanol
 - Standard solution B:** 1 mg/mL each of USP Actein RS, USP 23-*epi*-26-Deoxyactein RS, and isoferulic acid in methanol
 - Sample solution:** Fluidextract
 - Adsorbent:** Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)
 - Application volume:** 10 μL
 - Developing solvent system:** Use the upper phase of a mixture of butyl alcohol, glacial acetic acid, and water (5:1:4).
 - Spray reagent:** Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5). [NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Analysis

Samples: Standard solution A, Standard solution B, and Sample solution

Develop the chromatograms until the solvent front has moved about 15 cm, and dry the plate with the aid of a current of air.

Acceptance criteria: Examine the plate under UV light at 365 nm. The Sample solution exhibits main zones similar in position and color to the main zones of Standard solution A. In the upper third of the plate, the Sample solution exhibits a blue fluorescent zone at the level of the zone due to isoferulic acid of Standard solution B. Spray the plate with Spray reagent, heat at 100° for 5 min, and examine in daylight. The Sample solution exhibits main zones similar in position and color to the main zones of Standard solution A. Standard solution B exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein. The Sample solution exhibits several greenish-brown spots in the lower third of the plate and several violet zones above; two of these violet zones occur at R_f values similar to those due to actein and 23-*epi*-26-deoxyactein of Standard solution B.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 0.5 mL of Standard solution A prepared in Identification test A, diluted with methanol to 2.0 mL

Standard solution B: 1.0 mL of Standard solution B prepared in Identification test A, diluted with methanol to 5.0 mL

Sample solution: Use the Fluidextract, diluting if necessary with a suitable solvent to obtain a concentration of 0.25 mg/mL of triterpene glycosides.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm (HPTLC plates)

Application volume: 2 μL as an 8-mm band

Developing solvent system: Toluene, ethyl formate, and formic acid (5:3:2)

Spray reagent: Proceed as directed for Identification test A.

Analysis

Samples: Standard solution A, Standard solution B, and Sample solution

Develop until the solvent front has moved two-thirds of the length of the plate, and dry the plate with the aid of a current of air. Spray the plate with Spray reagent, heat at 100° for 5 min, and examine in daylight.

Acceptance criteria: The Sample solution exhibits main zones similar in position and color to the main zones of Standard solution A. Standard solution B exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein at R_f values of about 0.5 and 0.4, respectively. The Sample solution exhibits zones similar in color and R_f values to those due to actein and 23-*epi*-26-deoxyactein of Standard solution B.

- **C.** The Sample solution exhibits peaks for cimracemoside A, 26-deoxycimicifugoside, (26S)-actein, 23-*epi*-26-deoxyactein, cimigenol-arabinoside, and cimigenol-xyloside at retention times corresponding to those compounds in the Standard solution, as obtained in the test for Content of Triterpene Glycosides. The ratio of the peak areas of cimigenol-arabinoside to cimigenol-xyloside is NLT 0.4 (distinction from *Cimicifuga foetida*).

COMPOSITION

• CONTENT OF TRITERPENE GLYCOSIDES

Standard solution: Dissolve a quantity of USP Powdered Black Cohosh Extract RS in methanol with shaking for 1 min, and dilute with methanol to obtain a solution having a known concentration of 30 mg/mL. Pass through a membrane filter of 0.45- μm or finer pore size.

23-*epi*-26-Deoxyactein standard solutions: Dissolve USP 23-*epi*-26-Deoxyactein RS in methanol with shaking for 1 min. Dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations

of 500, 100, 50, 25, and 12.5 µg/mL. Pass through a membrane filter of 0.45-µm or finer pore size.

System suitability solution: 0.1 mg/mL each of USP Actein RS and USP 23-*epi*-26-Deoxyactein RS in methanol

Sample solution: Use the Fluidextract, diluting if necessary with methanol to obtain a concentration of about 0.75 mg/mL of triterpene glycosides. Centrifuge, or pass through a filter of 0.45-µm or finer pore size.

Solution A: 0.05% trifluoroacetic acid in water

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Water (%)	Solution A (%)	Solution B (%)
0	0	80	20
8	0	80	20
15	68	0	32
55	36	0	64
65	5	0	95
70	5	0	95
85	0	80	20

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: Evaporative light-scattering

[NOTE—The detector is set up according to the manufacturer's instruction in order to achieve a signal-to-noise ratio of NLT 10 for the 12.5-µg/mL 23-*epi*-26-Deoxyactein standard solution.]

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 35°

Flow rate: 1.6 mL/min

Injection size: 20 µL

System suitability

Samples: System suitability solution, Standard solution, and 100-µg/mL 23-*epi*-26-Deoxyactein standard solution

Suitability requirements

Chromatogram similarity: The chromatogram of the Standard solution is similar to the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS being used.

Resolution: NLT 1.0 between the (26S)-actein and the 23-*epi*-26-deoxyactein peaks, System suitability solution

Tailing factor: NMT 2.0 for the 23-*epi*-26-deoxyactein peak, 100-µg/mL 23-*epi*-26-Deoxyactein standard solution

Relative standard deviation: NMT 2.0% of the logarithm of the area response of the 23-*epi*-26-deoxyactein peak in repeated injections, 100-µg/mL 23-*epi*-26-Deoxyactein standard solution

Analysis

Samples: System suitability solution, Standard solution, 23-*epi*-26-Deoxyactein standard solutions, and Sample solution

Using the chromatogram of the Standard solution and the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS, identify the retention times of the peaks corresponding to the triterpene glycosides. The approximate relative retention times of the triterpene glycosides are provided in Table 2.

Table 2

Compound	Relative Retention Time
Cimicifugoside H-1	0.61
Cimiracemoside A	0.78

Table 2 (Continued)

Compound	Relative Retention Time
(26R)-Actein	0.94
26-Deoxycimicifugoside	0.96
(26S)-Actein	0.98
23- <i>epi</i> -26-Deoxyactein	1.00
Acetyl-shengmanol-xyloside	1.03
Cimigenol-arabinoside	1.08
Cimigenol-xyloside (cimicifugoside)	1.13
26-Deoxyactein	1.22
25-Acetyl-cimigenol-arabinoside	1.60
(24S)-25-Acetyl-cimigenol-xyloside	1.64
25-O-Methyl-cimigenol-arabinoside	1.90
25-O-Methyl-cimigenol-xyloside	1.93

Plot the logarithms of the peak area responses versus the logarithms of the concentrations, in µg/mL, of the 23-*epi*-26-Deoxyactein standard solutions, and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is NLT 0.995. From the graphs so obtained, determine the concentration, *C*, in µg/mL, of the relevant analyte in the Sample solution. Separately calculate the concentrations, in µg/mL, of cimicifugoside H-1, cimiracemoside A, (26R)-actein, 26-deoxycimicifugoside, (26S)-actein, 23-*epi*-26-deoxyactein, acetyl-shengmanol-xyloside, cimigenol-arabinoside, cimigenol-xyloside (cimicifugoside), 26-deoxyactein, 25-acetyl-cimigenol-arabinoside, (24S)-25-acetyl-cimigenol-xyloside, 25-O-methyl-cimigenol-arabinoside, and 25-O-methyl-cimigenol-xyloside as 23-*epi*-26-deoxyactein (C₃₇H₅₆O₁₀) in the portion of Fluidextract taken:

$$\text{Result} = (D \times C/V)$$

D = dilution factor for the Sample solution, if applicable: final volume of Sample solution/volume of aliquot of Fluidextract taken (mL/mL)

C = concentration of the relevant analyte in the Sample solution (µg/mL)

V = volume of the Fluidextract taken to prepare the Sample solution (mL)

Calculate the percentage of the labeled amount of triterpene glycosides in the portion of Fluidextract taken:

$$\text{Result} = \Sigma C/L \times 100$$

ΣC = sum of concentrations of the individual triterpene glycosides (mg/mL)

L = labeled concentration of triterpene glycosides of the Fluidextract (mg/mL)

Acceptance criteria: 90.0%–110.0%

CONTAMINANTS

- **HEAVY METALS <231>:** NMT 10 ppm
- **MICROBIAL ENUMERATION TESTS <2021>:** The total bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10³ cfu/g.
- **OTHER REQUIREMENTS:** It meets the requirements under Botanical Extracts <565>, Residual Solvents and Pesticide Residues.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool place.
- **LABELING:** It meets the requirements for Labeling under Botanical Extracts <565>. Label it to indicate the content, in percentage, of triterpene glycosides, calculated as

23-*epi*-26-deoxyactein. Dosage forms prepared with this article should bear the following statement: Discontinue use and consult a healthcare practitioner if you have a liver disorder or develop symptoms of liver trouble, such as abdominal pain, dark urine, or jaundice.

USP 23-*epi*-26-Deoxyactein RS

Powdered Black Cohosh

DEFINITION

Powdered Black Cohosh is Black Cohosh reduced to a powder or a very fine powder. It contains NLT 0.4% of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$) on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 100 mg/mL of USP Powdered Black Cohosh Extract RS in methanol

Standard solution B: 1 mg/mL each of USP Actein RS, USP 23-*epi*-26-Deoxyactein RS, and isoferulic acid in methanol

Sample solution: Transfer 5 g of Powdered Black Cohosh to a screw-capped centrifuge tube, add 10 mL of a mixture of alcohol and water (7:3), and heat on a steam bath for 10 min. Centrifuge, and use the clear supernatant.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)

Application volume: 10 μ L

Developing solvent system: Use the upper phase of a mixture of butyl alcohol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5). [NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved about 15 cm, and dry the plate with the aid of a current of air.

Acceptance criteria: Examine the plate under UV light at 365 nm. The chromatogram of the *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. In the upper third of the plate, the *Sample solution* exhibits a blue fluorescent zone at the level of the zone due to isoferulic acid of *Standard solution B*. Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight. The *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. *Standard solution B* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein. The *Sample solution* exhibits several greenish-brown spots in the lower third of the plate and several violet zones above; two of these violet zones occur at R_f values similar to those due to actein and 23-*epi*-26-deoxyactein of *Standard solution B*.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 0.5 mL of *Standard solution A* prepared in *Identification test A*, diluted with methanol to 2 mL

Standard solution B: 1.0 mL of *Standard solution B* prepared in *Identification test A*, diluted with methanol to 5 mL

Sample solution: Transfer 0.5 g of Powdered Black Cohosh to a screw-capped tube, add 5 mL of methanol, sonicate for 10 min, and filter into a 10-mL volumetric

flask. Wash the residue on the filter paper four times, using 1 mL of methanol for each washing; add the washings to the volumetric flask; and dilute with methanol to volume.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μ m (HPTLC plates)

Application volume: 2 μ L as an 8-mm band

Developing solvent system: Toluene, ethyl formate, and formic acid (5:3:2)

Spray reagent: Proceed as directed for *Identification test A*.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved about two-thirds of the length of the plate, and dry the plate with the aid of a current of air.

Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight.

Acceptance criteria: The *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. *Standard solution B* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein at R_f values of about 0.5 and 0.4, respectively. The *Sample solution* exhibits zones similar in color and R_f values to those due to actein and 23-*epi*-26-deoxyactein of *Standard solution B*.

- **C.** The *Sample solution* exhibits peaks for cimracemoside A, 26-deoxycimicifugoside, (26*S*)-actein, 23-*epi*-26-deoxyactein, cimigenol-arabinside, and cimigenol-xyloside at retention times corresponding to those compounds in the *Standard solution*, as obtained in the test for *Content of Triterpene Glycosides*. The ratio of the peak areas of cimigenol-arabinside to cimigenol-xyloside is NLT 0.4 (distinction from *Cimicifuga foetida*).

COMPOSITION

• CONTENT OF TRITERPENE GLYCOSIDES

Standard solution: Dissolve a quantity of USP Powdered Black Cohosh Extract RS in methanol with shaking for 1 min, and dilute with methanol to obtain a solution having a known concentration of 30 mg/mL. Pass through a membrane filter of 0.45- μ m or finer pore size.

23-*epi*-26-Deoxyactein standard solutions: Dissolve USP 23-*epi*-26-Deoxyactein RS in methanol with shaking for 1 min. Dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations of 500, 100, 50, 25, and 12.5 μ g/mL. Pass through a membrane filter of 0.45- μ m or finer pore size.

System suitability solution: 0.1 mg/mL each of USP Actein RS and USP 23-*epi*-26-Deoxyactein RS in methanol

Sample solution: Accurately weigh about 750 mg of Powdered Black Cohosh, and place in a 20-mL polytetrafluoroethylene capped centrifuge tube. Pipet 15 mL of methanol, sonicate for 30 min, centrifuge, and transfer the supernatant to an evaporation flask. Repeat the extraction twice. Evaporate the combined extracts under vacuum at 45°–50°. Dissolve the residue in methanol, and quantitatively transfer to a 10-mL volumetric flask. Dilute with methanol to volume, and pass through a membrane filter of 0.45- μ m or finer pore size.

Solution A: 0.05% trifluoroacetic acid in water

Solution B: Acetonitrile

Powdered Black Cohosh Extract

DEFINITION

Powdered Black Cohosh Extract is prepared from Black Cohosh by extraction with hydroalcoholic mixtures or other suitable solvents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$) on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 100 mg/mL of USP Powdered Black Cohosh Extract RS in methanol

Standard solution B: 1 mg/mL each of USP Actein RS, USP 23-*epi*-26-Deoxyactein RS, and isoferulic acid in methanol

Sample solution: Shake a quantity of Powdered Extract, equivalent to 25 mg of triterpene glycosides, in 10 mL of methanol. Allow to stand for 15 min before use.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)

Application volume: 10 μ L

Developing solvent system: Use the upper phase of a mixture of butyl alcohol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5). [NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved about 15 cm, and dry the plate with the aid of a current of air.

Acceptance criteria: Examine the plate under UV light at 365 nm. The chromatogram of the *Sample solution* exhibits main zones similar in position and color to the main zones in the chromatogram of *Standard solution A*. In the upper third of the plate, the chromatogram of the *Sample solution* exhibits a blue fluorescent zone at the level of the zone due to isoferulic acid in the chromatogram of *Standard solution B*. Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight. The chromatogram of the *Sample solution* exhibits main zones similar in position and color to the main zones in the chromatogram of *Standard solution A*. The chromatogram of *Standard solution B* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein. The chromatogram of the *Sample solution* exhibits several greenish-brown spots in the lower third of the plate and several violet zones above; two of these violet zones occur at R_f values similar to those due to actein and 23-*epi*-26-deoxyactein in the chromatogram of *Standard solution B*.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 0.5 mL of *Standard solution A* prepared in *Identification test A*, diluted with methanol to 2 mL

Standard solution B: 1.0 mL of *Standard solution B* prepared in *Identification test A*, diluted with methanol to 5 mL

Sample solution: Dilute 1 mL of the *Sample solution* prepared in *Identification test A* with methanol to 10 mL.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μ m (HPTLC plates)

Application volume: 2 μ L as an 8-mm band

Developing solvent system: Toluene, ethyl formate, and formic acid (5:3:2)

Spray reagent: Proceed as directed for *Identification test A*.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved about two-thirds of the length of the plate, and dry the plate with the aid of a current of air.

Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits main zones similar in position and color to the main zones in the chromatogram of *Standard solution A*. The chromatogram of *Standard solution B* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein at R_f values of about 0.5 and 0.4, respectively. The chromatogram of the *Sample solution* exhibits zones similar in color and R_f values to those due to actein and 23-*epi*-26-deoxyactein in the chromatogram of *Standard solution B*.

- **C.** The chromatogram of the *Sample solution* exhibits peaks for cimicracemoside A, 26-deoxycimicifugoside, (26S) actein, 23-*epi*-26-deoxyactein, cimigenol- α -arabinoside, and cimigenol-xyloside at retention times corresponding to those compounds in the chromatogram of the *Standard solution*, as obtained in the test for *Content of Triterpene Glycosides*. The ratio of the peak areas of cimigenol- α -arabinoside to cimigenol-xyloside is NLT 0.4 (distinction from *Cimicifuga foetida*).

COMPOSITION

• CONTENT OF TRITERPENE GLYCOSIDES

Standard solution: Dissolve a quantity of USP Powdered Black Cohosh Extract RS in methanol with shaking for 1 min, and dilute with methanol to obtain a solution having a known concentration of 30 mg/mL. Pass through a membrane filter of 0.45- μ m or finer pore size.

23-*epi*-26-Deoxyactein standard solutions: Dissolve USP 23-*epi*-26-Deoxyactein RS in methanol with shaking for 1 min. Dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations of 500, 100, 50, 25, and 12.5 μ g/mL. Pass through a membrane filter of 0.45- μ m or finer pore size.

System suitability solution: 0.1 mg/mL each of USP Actein RS and USP 23-*epi*-26-Deoxyactein RS in methanol

Sample solution: Transfer a quantity of Powdered Extract, equivalent to 7.5 mg of triterpene glycosides, to a 10-mL volumetric flask, add 7 mL of methanol, and sonicate for 30 min. Dilute with methanol to volume. Centrifuge, or pass through a filter of 0.45- μ m or finer pore size.

Solution A: 0.05% trifluoroacetic acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** Evaporative light-scattering[NOTE—The detector is set up according to the manufacturer's instruction in order to achieve a signal-to-noise ratio of NLT 10 for the 12.5-μg/mL 23-*epi*-26-Deoxyactein standard solution.]**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Column temperature:** 35°**Flow rate:** 1.6 mL/min**Injection size:** 20 μL**System suitability****Samples:** *System suitability solution*, *Standard solution*, and 100-μg/mL 23-*epi*-26-Deoxyactein standard solution**Suitability requirements****Chromatogram similarity:** The chromatogram of the *Standard solution* is similar to the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS being used.**Resolution:** NLT 1.0 between the (26*S*)-actein and the 23-*epi*-26-deoxyactein peaks, *System suitability solution***Tailing factor:** NMT 2.0 for the 23-*epi*-26-deoxyactein peak, 100-μg/mL 23-*epi*-26-Deoxyactein standard solution**Relative standard deviation:** NMT 2.0% of the logarithm of the area response of the 23-*epi*-26-deoxyactein peak in repeated injections, 100-μg/mL 23-*epi*-26-Deoxyactein standard solution**Analysis****Samples:** *System suitability solution*, *Standard solution*, 23-*epi*-26-Deoxyactein standard solutions, and *Sample solution*Using the chromatogram of the *Standard solution* and the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS, identify the retention times of the peaks corresponding to the triterpene glycosides. The approximate relative retention times of the triterpene glycosides are provided in Table 2.**Table 2**

Name	Relative Retention Time
Cimicifugoside H-1	0.61
Cimiracemoside A	0.78
(26 <i>R</i>)-Actein	0.94
26-Deoxycimicifugoside	0.96
(26 <i>S</i>)-Actein	0.98
23- <i>epi</i> -26-Deoxyactein	1.00
Acetyl-shengmanol-xyloside	1.03
Cimigenol-arabinside	1.08
Cimigenol-xyloside (cimicifugoside)	1.13
26-Deoxyactein	1.22
25-Acetyl-cimigenol-arabinside	1.60
(24 <i>S</i>)-25-Acetyl-cimigenol-xyloside	1.64
25-O-Methyl-cimigenol-arabinside	1.90
25-O-Methyl-cimigenol-xyloside	1.93

Plot the logarithms of the peak area responses versus the logarithms of the concentrations, in μg/mL, of the 23-*epi*-26-Deoxyactein standard solutions, and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is NLT 0.995. From the graphs so obtained, determine the concentration, *C*, in μg/mL, of the relevant analyte in the *Sample solution*. Separately calculate the percentages of cimicifugoside H-1, cimiracemoside A, (26*R*)-actein, 26-deoxycimicifugoside, (26*S*)-actein, 23-*epi*-26-deoxyactein, acetyl-shengmanol-xyloside,

cimigenol-arabinside, cimigenol-xyloside (cimicifugoside), 26-deoxyactein, 25-acetyl-cimigenol-arabinside, (24*S*)-25-acetyl-cimigenol-xyloside, 25-O-methyl-cimigenol-arabinside, and 25-O-methyl-cimigenol-xyloside as 23-*epi*-26-deoxyactein (C₃₇H₅₆O₁₀) in the portion of Extract taken:

$$\text{Result} = (V \times C) / (F \times W) \times 100$$

V = volume of the *Sample solution* (mL)*C* = concentration of the relevant analyte in the *Sample solution* (μg/mL)*F* = factor to convert mg to μg, 1000 μg/mg*W* = weight of the Powdered Extract taken to prepare the *Sample solution* (mg)

Calculate the percentage of the labeled amount of triterpene glycosides in the portion of Extract taken by adding all of the percentages calculated for individual analytes.

Acceptance criteria: 90.0%–110.0% on the dried basis**CONTAMINANTS**

- **HEAVY METALS** <231>: NMT 10 ppm
- **MICROBIAL ENUMERATION TESTS** <2021>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10³ cfu/g.
- **OTHER REQUIREMENTS:** It meets the requirements under *Botanical Extracts* <565>, *Pesticide Residues*.

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool place.
- **LABELING:** It meets the requirements under *Botanical Extracts* <565>. Label it to indicate the content of triterpene glycosides, in percentage, calculated as 23-*epi*-26-deoxyactein. Dosage forms prepared with this article should bear the following statement: "Discontinue use and consult a healthcare practitioner if you have a liver disorder or develop symptoms of liver trouble, such as abdominal pain, dark urine, or jaundice."
- **USP REFERENCE STANDARDS** <11>
 - USP Actein RS
 - USP Powdered Black Cohosh Extract RS
 - USP 23-*epi*-26-Deoxyactein RS

Black Cohosh Tablets**DEFINITION**

Black Cohosh Tablets contain Powdered Black Cohosh Extract or Black Cohosh Fluidextract. Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of Powdered Extract or Fluidextract, represented by the content of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein (C₃₇H₅₆O₁₀).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)**Sample solution:** 10 mL of the *Sample solution* prepared for *Identification test B*. Evaporate to dryness, and redissolve in 1 mL of methanol.**Standard solution A:** 100 mg/mL of USP Powdered Black Cohosh Extract RS in methanol**Standard solution B:** 1 mg/mL each of USP Actein RS, USP 23-*epi*-26-Deoxyactein RS, and isoferulic acid in methanol

Application volume: 10 μ L

Developing solvent system: Use the upper phase of a mixture of butyl alcohol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5)

[NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop until the solvent front has moved 15 cm, and dry the plate with the aid of a current of air. Examine the plate under UV light at a wavelength of 365 nm.

Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight.

Acceptance criteria: The *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*. Examined under UV light, the *Sample solution* exhibits a blue fluorescent zone at the level of the zone due to isoferulic acid in *Standard solution B*, in the upper third of the plate. Examined after treatment with *Spray reagent*, the *Sample solution* exhibits several greenish-brown spots in the lower third of the plate and several violet zones above; two of these violet zones occur at R_f values similar to those due to actein and 23-*epi*-26-deoxyactein in *Standard solution B*.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μ m (HPTLC plates)

Sample solution: Transfer the equivalent of the labeled amount of Powdered Extract or Fluidextract, containing 25 mg of triterpene glycosides from a portion of powdered Tablets, to 25 mL of water; shake to disperse; and sonicate for 10 min. Add 75 mL of methanol, and sonicate for 10 min. Allow to stand for 15 min, and use the clear supernatant.

Standard solution A: Methanol and *Standard solution A* prepared in *Identification test A* (3:1)

Standard solution B: Methanol and *Standard solution B* prepared in *Identification test A* (4:1)

Application volume: 2 μ L as an 8-mm band

Developing solvent system: Toluene, ethyl formate, and formic acid (5:3:2)

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5)

[NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop until the solvent front has moved two-thirds of the length of the plate, and dry the plate with the aid of a current of air. Spray the plate with *Spray reagent*, heat at 100° for 5 min, and examine in daylight.

Acceptance criteria: The *Sample solution* exhibits main zones similar in position and color to the main zones of *Standard solution A*, two of which are red-violet zones at R_f values of 0.5 and 0.4, similar in color and R_f values to those due to actein and 23-*epi*-26-deoxyactein in *Standard solution B*.

- **C.** The *Sample solution* exhibits peaks for cimracemoside A, 26-deoxycimicifugoside, (26S) actein, 23-*epi*-26-deoxyactein, cimigenol-arabinoside, and cimigenol-xyloside at retention times corresponding to those compounds in the *Standard solution*, as obtained in the test for *Content of Triterpene Glycosides*. The ratio of the peak areas of cimigenol-arabinoside to cimigenol-xyloside is NLT 0.4 (distinction from *Cimicifuga foetida*).

STRENGTH

• CONTENT OF TRITERPENE GLYCOSIDES

Solution A: Filtered and degassed 0.05% trifluoroacetic acid in water

Solution B: Filtered and degassed acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Water (%)	Solution A (%)	Solution B (%)
0	0	80	20
8	0	80	20
15	68	0	32
55	36	0	64
65	5	0	95
70	5	0	95
85	0	80	20

System suitability solution: 0.1 mg/mL each of USP Actein RS and USP 23-*epi*-26-Deoxyactein RS in methanol

Standard solution: Dissolve a quantity of USP Powdered Black Cohosh Extract RS in methanol with shaking for 1 min, and dilute with methanol to obtain a solution having a known concentration of 30 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer porosity.

23-*epi*-26-Deoxyactein standard solutions: Dissolve USP 23-*epi*-26-Deoxyactein RS in methanol with shaking for 1 min. Dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations of 500, 100, 50, 25, and 12.5 μ g/mL. Pass through a membrane filter having a 0.45- μ m or finer porosity.

Sample solution: Weigh NLT 20 Tablets, and finely powder. Transfer a quantity of the powder, equivalent to 8 mg of triterpene glycosides, to a suitable polytef-capped centrifuge tube. Add 3 mL of water, shake to disperse, and sonicate for 10 min at 60°. Add 3 mL of methanol, and sonicate for 10 min. Centrifuge, and transfer the clear supernatant to a 10-mL volumetric flask. Wash the residue twice with 1.5 mL of a mixture of methanol and water (1:1), and transfer the washings to the volumetric flask. Dilute with a mixture of methanol and water (1:1) to volume, and pass through a membrane filter having a 0.45- μ m or finer porosity.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering

[NOTE—Detector is set up according to the manufacturer's instruction in order to achieve a signal-to-noise ratio of NLT 10 for the 12.5 μ g/mL 23-*epi*-26-Deoxyactein standard solution.]

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1.6 mL/min

Injection size: 20 μ L

System suitability

Samples: *System suitability solution* and 100 μ g/mL of 23-*epi*-26-Deoxyactein standard solution

Suitability requirements

Chromatographic profile: The chromatogram of the *Standard solution* is similar to the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS.

Resolution: NLT 1.0 between the (26S)-actein and the 23-*epi*-26-deoxyactein peaks, *System suitability solution*

Tailing factor: NMT 2.0 for the 23-*epi*-26-deoxyactein peak, 100 μ g/mL 23-*epi*-26-Deoxyactein standard solution

Relative standard deviation: NMT 2.0% for the logarithm of the area responses for replicate injections, 100 μ g/mL 23-*epi*-26-Deoxyactein standard solution

Analysis

Samples: *System suitability solution*, *Standard solution*, 23-*epi*-26-Deoxyactein standard solutions, and *Sample solution*

Using the chromatogram of the *Standard solution* and the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS, identify the retention times of the peaks corresponding to the triterpene glycosides. The approximate relative retention times of the triterpene glycosides are provided in the following table.

Name	Relative Retention Time
Cimicifugoside H-1	0.61
Cimiracemoside A	0.78
(26 <i>R</i>)-Actein	0.94
26-Deoxycimicifugoside	0.96
(26 <i>S</i>)-Actein	0.98
23- <i>epi</i> -26-Deoxyactein	1.00
Acetyl-shengmanol-xyloside	1.03
Cimigenol-arabinoside	1.08
Cimigenol-xyloside (cimicifugoside)	1.13
26-Deoxyactein	1.22
25-Acetyl-cimigenol-arabinoside	1.60
(24 <i>S</i>)-25-Acetyl-cimigenol-xyloside	1.64
25-O-Methyl-cimigenol-arabinoside	1.90
25-O-Methyl-cimigenol-xyloside	1.93

Plot the logarithms of the peak area responses versus the logarithms of the concentrations, in $\mu\text{g/mL}$, of the 23-*epi*-26-Deoxyactein *standard solutions*, and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is NLT 0.995. From the graphs so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of the relevant analyte in the *Sample solution*.

Calculate the quantity, in mg, of triterpene glycosides in the portion of Tablets taken:

$$\text{Result} = C_T/100$$

C_T = sum of the concentrations C , in $\mu\text{g/mL}$, of all the relevant triterpene glycosides, calculated as 23-*epi*-26-deoxyactein

Calculate the percentage of the labeled amount of Extract in the portion of Tablets taken:

$$\text{Result} = (A_{WT}/W) \times (100/L_E) \times (100/L) \times C_{TT}$$

A_{WT} = average weight of Tablets

W = weight of sample

L_E = labeled content, as percentage, of triterpenes in the Extract used to prepare the Tablets

L = labeled amount of Extract per Tablet

C_{TT} = content, in mg, of triterpenes in the sample

Acceptance criteria: 90.0%–110.0% of the labeled amount of Powdered Extract or Fluidextract, represented by the content of triterpene glycosides

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2021>: The total bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **MICROBIAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2022>: Tablets meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. The label also indicates the amount, in mg/Tablet, of Powdered Extract or Fluidextract; the solvents used to prepare the Powdered Extract or Fluidextract; and the ratio of starting crude plant material to Powdered Extract or Fluidextract. Label it to indicate the content, in percentage, of triterpene glycosides as 23-*epi*-26-deoxyactein in the Powdered Extract or Fluidextract used to prepare the Tablets. The label bears the following statement: Discontinue use and consult a healthcare practitioner if you have a liver disorder or develop symptoms of liver trouble, such as abdominal pain, dark urine, or jaundice.
- **USP REFERENCE STANDARDS** <11>
 - USP Actein RS
 - USP Powdered Black Cohosh Extract RS
 - USP 23-*epi*-26-Deoxyactein RS

Add the following:

▲ Black Pepper

DEFINITION

Black Pepper consists of the dried fully developed unripe fruits of *Piper nigrum* L. (Fam. Piperaceae). It contains NLT 2.5% of piperine, calculated on the dried basis.

IDENTIFICATION

- **A.** Black Pepper meets the requirements under *Specific Tests, Botanic Characteristics*.

• B. THIN-LAYER CHROMATOGRAPHY

Standard solution A: 0.9 mg/mL of USP Piperine RS in methanol

Standard solution B: 2.0 mg/mL of borneol in methanol

Standard solution C: 5 mg/mL of USP Powdered Black Pepper Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Sonicate for 10 min about 0.5 g of Black Pepper, finely powdered, in 5 mL of methanol, centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm (HPTLC plates)

Application volume: 15 μL of *Standard solution C*, 7 μL of the *Sample solution*, and 3 μL of the *Standard solution A* and *Standard solution B*, as bands

Developing solvent system: A mixture of hexanes and ethyl acetate (5:3)

Derivatization reagent: A mixture of 17 mL of ice-cooled methanol, 2 mL of acetic acid, 1 mL of sulfuric acid, and 0.1 mL of anisaldehyde mixed in this order.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Apply the *Samples* as bands to a suitable high performance thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber, and condition the plate to a relative humidity of about 33% using a suitable device. Develop the chromatograms until the solvent front has moved up about 7 cm from the lower edge of the plate. Remove the plate from the chamber, dry, and examine under UV light at 254 nm. Derivatize with the *Derivatization reagent*, heat for 5 min at 100°, and examine under visible light.

Acceptance criteria: Under UV 254 nm, the chromatogram of the *Sample solution* exhibits an intense quenching band at R_f of about 0.15 corresponding in R_f to the piperine band in the chromatogram of *Standard solution A*, a quenching band at R_f of about 0.02, and three quenching bands located between R_f of about 0.3 and 0.5. Under visible light and after derivatization, the chromatogram of the *Sample solution* exhibits main bands similar in position and color to the main bands in the chromatogram of *Standard solution C*. These bands include a dark green band of the same color and R_f as the piperine band in *Standard solution A* (R_f of about 0.15), a weak violet band at R_f of about 0.47 below the position of the band due to borneol in *Standard solution B*, and a greenish band in the lower part of the chromatogram at R_f of about 0.07. Other minor bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. No blue bands are detected in the chromatogram of the *Sample solution* at R_f of about 0.10 and 0.58 (distinction from Long Pepper).

• C. HPLC

Analysis: Proceed as directed in the test for *Content of Piperine*.

Acceptance criteria: The chromatogram of the *Sample solution* obtained at 343 nm exhibits a major peak at the retention time corresponding to piperine. Identify other piperamide peaks in the *Sample solution* chromatogram by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used. The *Sample solution* chromatogram shows an additional peak corresponding to piperylene. The chromatogram of the *Sample solution* obtained at 270 nm does not exhibit a peak due to (2*E*, 4*E*)-*N*-isobutyldecadienamide at a relative retention time of 1.14 to the piperine peak (distinction from Long Pepper).

COMPOSITION

• CONTENT OF PIPERINE

Solution A: Dissolve 0.14 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, and add 0.5 mL of phosphoric acid. Dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
35	55	45
40	95	5
45	95	5

[NOTE—Proceed under subdued light or using low-actinic glassware.]

Standard solution A: 0.1 mg/mL of USP Piperine RS in methanol

Standard solution B: Sonicate a portion of USP Powdered Black Pepper Extract RS in methanol to obtain a solution having a concentration of about 0.5 mg/mL. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Transfer about 2.0 g of Black Pepper, finely powdered and accurately weighed, to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for about 20 min, allow to

settle, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, concentrate under vacuum, and adjust the volume to 100 mL using methanol. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 343 nm and 270 nm

Column: 4.6-mm × 25-cm; 5-μm, 100 Å packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used.

Tailing factor: NMT 1.5 for the piperine peak, *Standard solution A*

Relative standard deviation: NMT 2.5% determined from the piperine peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 6 h at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used, identify the retention times of the peaks corresponding to piperine and piperylene in the *Sample solution* chromatogram.

Calculate the percentage of piperine in the portion of Black Pepper taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area for piperine from the *Sample solution* chromatogram at 343 nm

r_S = peak area for piperine from the *Standard solution A* chromatogram at 343 nm

C_S = concentration of piperine in *Standard solution A* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Black Pepper used to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 2.5% on the dried basis

CONTAMINANTS

• **HEAVY METALS**, *Method III* (231): NMT 20 μg/g

• **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

• **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10³ cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Fruit is an indehiscent, one-seeded berry, globose, ovoid to oblong, 3.5–6 mm in diameter, hard; surface is greyish-black to brownish-black, rough, with raised reticulate wrinkles, shows remains of sessile stigma on the tip and a basal scar showing point of attachment to the axis; characteristic aromatic odor; characteristic pungent taste; seed white and hollow.

Microscopic

Transverse cut: Circular in outline with corrugated margin; shows outer narrow brownish pericarp; a seed coat encircling the wide central whitish perisperm, hollow in center; a narrow vertically running channel connecting the hollow center of the fruit to a small endosperm adherent to the remains of the stigma; a small embryo is present in the endosperm; a conical short projection at the base showing point of attachment to the axis.

Transverse section: Shows a well differentiated pericarp, testa and perisperm; pericarp consists of a layer of epicarp, a wide mesocarp, and a layer of endocarp; the epicarp layer is covered with thick cuticle and containing a few stomata and small prisms of calcium oxalate; mesocarp composed of 2–3 layers of parenchyma cells showing groups of rectangular to circular lignified sclereides, a broad zone (12–15 layers) of tangentially running parenchyma cells containing starch grains and showing isolated oval oil cells, a broad zone (10–15 layers) of compactly arranged parenchyma cells smaller than those of the outer zone and showing groups of fibrovascular bundles, 1–2 layers of tangentially running oil cells, and 2–3 layers of thick-walled parenchyma cells; endocarp is composed of one layer of three-sided thickened pitted stone cells (beaker-shape cells); testa is composed of one layer of cells filled with brown pigments; perisperm is very wide, composed of cells full of starch grains, some aleurone grains, and oil cells.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11)
USP Piperine RS
USP Powdered Black Pepper Extract RS▲ USP36

Add the following:

▲ Powdered Black Pepper

DEFINITION

Powdered Black Pepper is Black Pepper reduced to powder or very fine powder. It contains NLT 2.5% of piperine, calculated on the dried basis.

IDENTIFICATION

- **A.** Powdered Black Pepper meets the requirements under *Specific Tests, Botanic Characteristics*.

- **B. THIN-LAYER CHROMATOGRAPHY**

Standard solution A: 0.9 mg/mL of USP Piperine RS in methanol

Standard solution B: 2.0 mg/mL of borneol in methanol

Standard solution C: 5 mg/mL of USP Powdered Black Pepper Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Sonicate for 10 min about 0.5 g of Powdered Black Pepper in 5 mL of methanol, centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)

Application volume: 15 µL of *Standard solution C*, 7 µL of the *Sample solution*, and 3 µL of *Standard solution A* and *Standard solution B*, as bands, 8 mm

Developing solvent system: A mixture of hexanes and ethyl acetate (5:3)

Derivatization reagent: A mixture of 17 mL of ice-cooled methanol, 2 mL of acetic acid, 1 mL of sulfuric acid, and 0.1 mL of anisaldehyde mixed in this order.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Apply the *Samples* as bands to a suitable high performance thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber, and condition the plate to a relative humidity of about 33% using a suitable device. Develop the chromatograms until the solvent front has moved up about 7 cm from the lower edge of the plate. Remove the plate from the chamber, dry, and examine under UV light at 254 nm. Derivatize with the *Derivatization reagent*, heat for 5 min at 100°, and examine under visible light.

Acceptance criteria: Under UV 254 nm, the chromatogram of the *Sample solution* exhibits an intense quenching band at R_f of about 0.15 corresponding in R_f to the piperine band in the chromatogram of *Standard solution A*, a quenching band at R_f of about 0.02, and three quenching bands of similar intensity equally spaced located between R_f of about 0.3 and 0.5. Under visible light and after derivatization, the chromatogram of the *Sample solution* exhibits main bands similar in position and color to the main bands in the chromatogram of *Standard solution C*. These bands include a dark green band of the same color and R_f as the piperine band in *Standard solution A* (R_f of about 0.15), a weak violet band at R_f of about 0.47 below the position of the band due to borneol in *Standard solution B*, and a greenish band in the lower part of the chromatogram at R_f of about 0.07. Other minor bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. No blue bands are detected in the chromatogram of the *Sample solution* at R_f of about 0.10 and 0.58 (distinction from Long Pepper).

- **C. HPLC**

Analysis: Proceed as directed in the test for *Content of Piperine*.

Acceptance criteria: The chromatogram of the *Sample solution* obtained at 343 nm exhibits a major peak at the retention time corresponding to piperine. Identify other piperamide peaks in the *Sample solution* chromatogram by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used. The *Sample solution* chromatogram shows an additional peak corresponding to piper-ylene. The chromatogram of the *Sample solution* obtained at 270 nm does not exhibit a peak due to (2E, 4E)-N-isobutyldeca-dienamide at a relative retention time

of 1.14 to the piperine peak (distinction from Long Pepper).

COMPOSITION

• CONTENT OF PIPERINE

Solution A: Dissolve 0.14 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, and add 0.5 mL of phosphoric acid. Dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
35	55	45
40	95	5
45	95	5

[NOTE—Proceed under subdued light or using low-actinic glassware.]

Standard solution A: 0.1 mg/mL of USP Piperine RS in methanol

Standard solution B: Sonicate a portion of USP Powdered Black Pepper Extract RS in methanol to obtain a solution having a concentration of about 0.5 mg/mL. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Transfer about 2.0 g of Powdered Black Pepper, accurately weighed, to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for about 20 min, allow to settle, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, concentrate under vacuum, and adjust the volume to 100 mL using methanol. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 343 nm and 270 nm

Column: 4.6-mm × 25-cm; 5-μm, 100 Å packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used.

Tailing factor: NMT 1.5 for the piperine peak, *Standard solution A*

Relative standard deviation: NMT 2.5% determined from the piperine peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 6 h at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used, identify the retention times of the peaks corresponding to piperine and piperidine in the *Sample solution* chromatogram.

Calculate the percentage of piperine in the portion of Powdered Black Pepper taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area for piperine from the *Sample solution* chromatogram at 343 nm

r_S = peak area for piperine from the *Standard solution A* chromatogram at 343 nm

C_S = concentration of piperine in *Standard solution A* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Powdered Black Pepper used to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 2.5% on the dried basis

CONTAMINANTS

• **USP REFERENCE STANDARDS** (11)

USP Piperine RS

USP Powdered Black Pepper Extract RS▲ USP36

Add the following:

▲ **Powdered Black Pepper Extract**

DEFINITION

Powdered Black Pepper Extract is prepared from Black Pepper using suitable solvents such as ethyl acetate, methanol, or a mixture of these solvents. The ratio of plant material to extract is about 15:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of piperine. It may contain suitable added substances as carriers.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHY**

Standard solution A: 0.9 mg/mL of USP Piperine RS in methanol

Standard solution B: 2.0 mg/mL of borneol in methanol

Standard solution C: 5 mg/mL of USP Powdered Black Pepper Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Sonicate for about 10 min an amount of Powdered Extract, equivalent to about 10 mg of piperine, in 10 mL of methanol, centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)

Application volume: 15 µL of *Standard solution C*, 7 µL of the *Sample solution*, and 3 µL of *Standard solution A* and *Standard solution B*, as bands, 8 mm

Developing solvent system: A mixture of hexanes and ethyl acetate (5:3)

Derivatization reagent: A mixture of 17 mL of ice-cooled methanol, 2 mL of acetic acid, 1 mL of sulfuric acid, and 0.1 mL of anisaldehyde mixed in this order.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Apply the *Samples* as bands to a suitable high performance thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber, and condition the plate to a relative humidity of about 33% using a suitable device. Develop the chromatograms until the solvent front has moved up about 7 cm from the lower edge of the plate. Remove the plate from the chamber, dry, and examine under UV light at 254 nm. Derivatize with the *Derivatization reagent*, heat for 5 min at 100°, and examine under visible light.

Acceptance criteria: Under UV 254 nm, the chromatogram of the *Sample solution* exhibits an intense quenching band at R_f of about 0.15 corresponding in R_f to the piperine band in the chromatogram of *Standard solution A*, a quenching band at R_f of about 0.02, and three quenching bands of similar intensity equally spaced located between R_f of about 0.3 and 0.5. Under visible light and after derivatization, the chromatogram of the *Sample solution* exhibits main bands similar in position and color to the main bands in the chromatogram of *Standard solution C*. These bands include a dark green band of the same color and R_f as the piperine band in

Standard solution A (R_f of about 0.15), a weak violet band at R_f of about 0.47 below the position of the band due to borneol in *Standard solution B*, and a greenish band in the lower part of the chromatogram at R_f of about 0.07. Other minor bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. No blue bands are detected in the chromatogram of the *Sample solution* at R_f of about 0.10 and 0.58 (distinction from Long Pepper).

• **B. HPLC**

Analysis: Proceed as directed in the test for *Content of Piperine*.

Acceptance criteria: The chromatogram of the *Sample solution* obtained at 343 nm exhibits a major peak at the retention time corresponding to piperine. Identify other piperamide peaks in the *Sample solution* chromatogram by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used. The *Sample solution* chromatogram shows an additional peak corresponding to piperidine. The chromatogram of the *Sample solution* obtained at 270 nm does not exhibit a peak due to (2*E*, 4*E*)-*N*-isobutyldecadienamide at a relative retention time of 1.14 to the piperine peak (distinction from Long Pepper).

COMPOSITION

• **CONTENT OF PIPERINE**

Solution A: Dissolve 0.14 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, and add 0.5 mL of phosphoric acid. Dilute with water to 1000 mL, mix, filter, and degas.

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)

25	20	80
28	20	80
35	55	45
40	95	5
45	95	5

[NOTE—Proceed under subdued light or using low-actinic glassware.]

Standard solution A: 0.1 mg/mL of USP Piperine RS in methanol

Standard solution B: Sonicate a portion of USP Powdered Black Pepper Extract RS in methanol to obtain a solution having a concentration of about 0.5 mg/mL. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Transfer an accurately weighed amount of Powdered Extract, equivalent to about 25 mg of piperine, to a 25-mL volumetric flask, add 15 mL of methanol, and sonicate for 10 min. Cool to room temperature, dilute with methanol to volume, and mix. Dilute the obtained solution in methanol (1:10). Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 343 nm and 270 nm

Column: 4.6-mm × 25-cm; 5-μm, 100 Å packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used.

Tailing factor: NMT 1.5 for the piperine peak, *Standard solution A*

Relative standard deviation: NMT 2.5% determined from the piperine peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 6 hours at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Black Pepper Extract RS being used, identify the retention time of the peaks corresponding to piperine and piperidine in the *Sample solution* chromatogram.

Calculate the percentage of piperine in the portion of Powdered Extract taken:

$$P = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for piperine from the *Sample solution* chromatogram at 343 nm

r_S = peak area for piperine from the *Standard solution A* chromatogram at 343 nm

C_S = concentration of piperine in *Standard solution A* (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of piperine in the portion of Powdered Extract taken:

$$\text{Result} = (P/L) \times 100$$

P = content of piperine as determined above (%)

L = labeled amount of piperine (%)

Acceptance criteria: 90%–110% on the dried basis

• USP REFERENCE STANDARDS (11)

USP Piperine RS

USP Powdered Black Pepper Extract RS▲ USP36

Boswellia serrata

DEFINITION

Boswellia serrata is the oleogum resin obtained by incision or produced by spontaneous exudation from the stem and branches of *Boswellia serrata* Roxb. (Fam. Burseraceae). It contains NLT 1.0% of the keto derivatives of β-boswellic acid, calculated on the dried basis as the sum of 11-keto-β-boswellic acid and 3-acetyl-11-keto-β-boswellic acid.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: Treat a quantity of USP *Boswellia serrata* Extract RS with gentle heating in methanol to obtain a solution having a known concentration of 30 mg/mL, cool, centrifuge, and use the supernatant.

Sample solution: Use the *Sample solution*, prepared as directed in the test below for *Content of Keto-Derivatives of β-Boswellic Acids*, and concentrate to 10% of the volume.

Adsorbent: 0.25-mm layer of chromatographic silica gel

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Dipping reagent: Prepare a solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh immediately before use.]

Application volume: 10 μL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop until the solvent front has moved up about 90% of the plate. Remove, dry, and examine under UV light at 254 nm. Dip in the *Dipping reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: Under UV light at 254 nm, the *Sample solution* exhibits two main zones due to 11-keto-β-boswellic acid and 3-acetyl-11-keto-β-boswellic acid at R_f values of about 0.30 and 0.36, respectively, corresponding to zones from the *Standard solution*. Under visible light, the *Sample solution* exhibits two additional zones due to β-boswellic acid and 3-acetyl-β-boswellic acid at R_f values of about 0.49 and 0.58, respectively, corresponding to zones from the *Standard solution*. Other, less intense zones are observed for the *Sample solution* and the *Standard solution*.

- **B.** The 210-nm chromatogram of the *Sample solution*, in the test for *Content of Keto-Derivatives of β-Boswellic Acids*, exhibits peaks for 11-keto-β-boswellic acid, 3-acetyl-11-keto-β-boswellic acid, β-boswellic acid, and 3-acetyl-β-boswellic acid at retention times that correspond to those in the 210-nm chromatogram of *Standard solution B* and the 210-nm Reference Chromatogram provided with the USP *Boswellia serrata* Extract RS.

COMPOSITION

• CONTENT OF KETO-DERIVATIVES OF β-BOSWELLIC ACIDS

Standard solution A: Dissolve a quantity of USP 3-Acetyl-11-keto-β-Boswellic Acid RS in methanol to obtain a solution having a known concentration of 0.1 mg/mL.

Standard solution B: Treat a quantity of USP *Boswellia serrata* Extract RS with gentle heating in methanol to obtain a solution having a known concentration of

10 mg/mL. Before injection, pass through a filter of 0.45- μ m pore size.

Sample solution: Transfer about 2.0 g of crushed *Boswellia serrata* to a round-bottom flask, and reflux in 50 mL of methanol in a water bath for 15 min, stirring with a magnetic stirrer. Repeat till the last extract turns colorless. Evaporate the combined extracts to about 50 mL, transfer to a 100-mL volumetric flask, and dilute with methanol to volume. Before injection, pass through a filter of 0.45- μ m pore size, and discard the first few mL of the filtrate.

Mobile phase: Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (900:100:0.1). Make adjustments if necessary.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: See the gradient table below.

Time (min)	Flow Rate (mL/min)
0	1
5	1.5
10	2
30	2
32	1
45	1

Injection size: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*
[NOTE—The relative retention times for 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid are about 1.0 and 1.4, respectively.]

Suitability requirements: The chromatogram of *Standard solution B* is similar to the 254-nm Reference Chromatogram provided with the USP *Boswellia serrata* Extract RS.

Relative standard deviation: NMT 2.0% of the 3-acetyl-11-keto- β -boswellic acid peak response for replicate injections, *Standard solution A*

Tailing factor: NMT 1.5, 11-keto- β -boswellic acid peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution B* and the 254-nm Reference Chromatogram provided with the lot of USP *Boswellia serrata* Extract RS, identify the retention times of the peaks of 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid in the *Sample solution*.

Separately calculate the percentages of the two analytes in the portion of *Boswellia serrata* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times 10F$$

r_U = peak area of each analyte from the *Sample solution*

r_S = peak area of 3-acetyl-11-keto- β -boswellic acid from *Standard solution A*

C_S = concentration of USP 3-Acetyl-11-keto- β -Boswellic Acid RS in *Standard solution A* (mg/mL)

W = weight of *Boswellia serrata* taken to prepare the *Sample solution* (g)

F = conversion factor for each analyte (0.93 for 11-keto- β -boswellic acid and 1.0 for 3-acetyl-11-keto- β -boswellic acid)

Acceptance criteria: Add the percentages calculated for 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid: NLT 1.0% on the dried basis.

IMPURITIES

Inorganic Impurities

• **USP REFERENCE STANDARDS** <11>
USP 3-Acetyl-11-keto- β -Boswellic Acid RS
USP *Boswellia serrata* Extract RS

Boswellia serrata Extract

DEFINITION

Boswellia serrata Extract is prepared from pulverized *Boswellia serrata*, using suitable solvents such as isopropanol, alcohol, methanol, hexanes, or mixtures of these solvents. The ratio of starting plant material to Extract is approximately 6:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of Extract, calculated, on the dried basis, as the sum of 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid; it may contain suitable added substances.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Standard solution: Treat a quantity of USP *Boswellia serrata* Extract RS with gentle heating in methanol to obtain a solution having a known concentration of 30 mg/mL, cool, centrifuge, and use the supernatant.

Sample solution: Treat a quantity of Extract with gentle heating in methanol to obtain a solution having a known concentration of 30 mg/mL, cool, centrifuge, and use the supernatant.

Adsorbent: 0.25-mm layer of chromatographic silica gel

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Dipping reagent: Prepare a solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh immediately before use.]

Application volume: 10 μ L

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop until the solvent front has moved up about 90% of the plate. Remove, dry, and examine under UV light at 254 nm. Dip in the *Dipping reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: Under UV light at 254 nm, the *Sample solution* exhibits two main zones due to 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid at R_f values of about 0.30 and 0.36, respectively, corresponding to zones from the *Standard solution*. Under visible light, the *Sample solution* exhibits two additional zones due to β -boswellic acid and 3-acetyl- β -boswellic acid at R_f values of about 0.49 and 0.58, respectively, corresponding to zones from the *Standard solution*. Other, less intense zones are observed for the *Sample solution* and the *Standard solution*.

- **B.** The 210-nm chromatogram of the *Sample solution*, in the test for *Content of Keto-Derivatives of β -Boswellic Acids*, exhibits peaks for 11-keto- β -boswellic acid, 3-acetyl-11-keto- β -boswellic acid, β -boswellic acid, and 3-acetyl- β -boswellic acid at retention times that correspond to those in the 210-nm chromatogram of *Standard solution B* and the 210-nm Reference Chromatogram provided with the USP *Boswellia serrata* Extract RS.

COMPOSITION

• CONTENT OF KETO-DERIVATIVES OF β -BOSWELIC ACIDS

Standard solution A: Dissolve a quantity of USP 3-Acetyl-11-keto- β -Boswellic Acid RS in methanol to obtain a solution having a known concentration of 0.1 mg/mL.

Standard solution B: Treat a quantity of USP *Boswellia serrata* Extract RS with gentle heating in methanol to obtain a solution having a known concentration of 10 mg/mL. Before injection, pass through a filter of 0.45- μ m pore size.

Sample solution: Treat a quantity of Extract with gentle heating in methanol to obtain a solution having a known concentration of 10 mg/mL. Before injection, pass through a filter of 0.45- μ m pore size, and discard the first few mL of the filtrate.

Mobile phase: Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (900:100:0.1). Make adjustments if necessary.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: See the gradient table below.

Time (min)	Flow Rate (mL/min)
0	1
5	1.5
10	2
30	2
32	1
45	1

Injection size: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*
[NOTE—The relative retention times for 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid are about 1.0 and 1.4, respectively.]

Suitability requirements: The chromatogram of *Standard solution B* is similar to the 254-nm Reference Chromatogram provided with the USP *Boswellia serrata* Extract RS.

Tailing factor: NMT 1.5, 11-keto- β -boswellic acid peak, *Standard solution A*

Relative standard deviation: NMT 2.0% of the 3-acetyl-11-keto- β -boswellic acid peak response for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution B* and the 254-nm Reference Chromatogram provided with the lot of USP *Boswellia serrata* Extract RS, identify the retention times of the peaks of 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid in the *Sample solution* chromatogram.

Separately calculate the percentages of 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid in the portion of Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/V/W) \times 100F$$

r_U = peak area of each analyte from the *Sample solution*

r_S = peak area of 3-acetyl-11-keto- β -boswellic acid from *Standard solution A*

C_S = concentration of USP 3-Acetyl-11-keto- β -Boswellic Acid RS in *Standard solution A* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Extract taken to prepare the *Sample solution* (mg)

F = conversion factor for each analyte (0.93 for 11-keto- β -boswellic acid and 1.0 for 3-acetyl-11-keto- β -boswellic acid)

Acceptance criteria: Add the percentages of the two analytes. It contains NLT 90.0% and NMT 110.0% of the labeled amount of Extract, calculated on the dried basis, as the sum of 11-keto- β -boswellic acid and 3-acetyl-11-keto- β -boswellic acid.

IMPURITIES

Inorganic Impurities

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

Organic Impurities

- **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry 1.0 g of Extract at 105° for 2 h: it loses NMT 5.0% of its weight.
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store in a cool place.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. It meets other labeling requirements under *Botanical Extracts* <565>.
- **USP REFERENCE STANDARDS** <11>
USP 3-Acetyl-11-keto- β -Boswellic Acid RS
USP *Boswellia serrata* Extract RS

Calcium Ascorbate—see *Calcium Ascorbate General Monographs*

Calcium Carbonate—see *Calcium Carbonate General Monographs*

Calcium Carbonate Oral Suspension—see *Calcium Carbonate Oral Suspension General Monographs*

Calcium Carbonate Tablets—see *Calcium Carbonate Tablets General Monographs*

Calcium Citrate—see *Calcium Citrate General Monographs*

Calcium Citrate Tablets

DEFINITION

Calcium Citrate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium (Ca).

IDENTIFICATION

- A.** The *Sample solution* from the test for *Strength* produces line emissions or absorptions at the characteristic wavelengths for calcium.
- B. IDENTIFICATION TESTS—GENERAL.** *Calcium* (191) and *Citrate* (191)

Analysis: Grind a Tablet to a fine powder in a mortar. Transfer the powder to a centrifuge tube, add 2–5 mL of water, sonicate for 1 min, shake, and centrifuge.

Acceptance criteria: The supernatant meets the requirements of the tests.

STRENGTH

[NOTE—A standard stock solution is commercially available at different calcium concentrations. Necessary volumetric adjustment can be made in the *Standard solution*. Concentrations of the *Standard solution* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

- CONTENT OF CALCIUM, Procedure 1**

Standard stock solution: Weigh about 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, and dissolve in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 100 mL to obtain a solution having a known concentration of about 4000 µg/mL of calcium.

Standard solution: To a 200-mL volumetric flask add 100 mL of water and 4 mL of nitric acid, and mix thoroughly. Pipet 25.0 mL of the *Standard stock solution* into the volumetric flask, and dilute with water to volume to obtain a solution having a known concentration of about 500 µg/mL of calcium.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a weighed portion of the powdered Tablets, equivalent to about 0.1 g of calcium, to a 50-mL flask. Add 4 mL of nitric acid, and heat the solution to boil gently, during which fuming evolves. Boil the solution for an additional 30 min with constant swirling, during which no fuming should be observed.

Cool the solution to room temperature, quantitatively transfer all of the solution to a 200-mL volumetric flask, dilute with water to volume, mix, and filter.

Instrumental conditions

(See *Plasma Spectrochemistry* (730).)

Mode: ICP-AES

Analytical wavelength: 317.93 nm. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. A typical setting includes radio frequency (RF) power of about 1300 watts, argon torch flow of about 15 L/min, argon auxiliary flow of about 0.2 L/min, and a nebulizer flow rate of about 0.8 L/min.]

Analysis: Determine the emission of the *Standard solution*, the *Sample solution*, and a 2% nitric acid solution as the blank at the wavelength indicated above.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of calcium from the *Sample solution*

r_S = peak response of calcium from the *Standard solution*

C_S = concentration of calcium in the *Standard solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

- CONTENT OF CALCIUM, Procedure 2**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL to obtain a concentration of 400 µg/mL of calcium.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* in 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Sample solution: [NOTE—Finely powder NLT 20 Tablets.]

Transfer an equivalent to 5 Tablets from powdered Tablets to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively, with 0.125 N hydrochloric acid to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide-acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and the *Sample solution*. Determine the absorbances of the solutions, using the *Blank*. From a linear regression equation, calculated using the absorbance of the *Standard solutions* versus concentrations, determine the concentration, *C*, in µg/mL of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of calcium in the *Sample solution*

C_U = nominal concentration of calcium in the *Sample solution*

Acceptance criteria: 90.0%–110.0%

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 1000 cfu/g. The total combined yeasts and molds count does not exceed 100 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meet the requirements of the test for absence of *Escherichia coli*

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** (2040): Meet the requirements for *Disintegration*, 15 min
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The label states the quantity of calcium in terms of mg/Tablet.

Calcium Glubionate Syrup—see *Calcium Glubionate Syrup General Monographs*

Calcium Gluceptate—see *Calcium Gluceptate General Monographs*

Calcium Gluconate—see *Calcium Gluconate General Monographs*

Calcium Gluconate Tablets—see *Calcium Gluconate Tablets General Monographs*

Calcium Glycerophosphate

C₃H₇CaO₆P 210.14
1,2,3-Propanetriol, mono(dihydrogen phosphate) calcium salt (1:1);
Calcium glycerophosphate [27214-00-2].

DEFINITION

Calcium Glycerophosphate is a mixture, in variable proportions, of calcium (RS)-2,3-dihydroxypropyl phosphate and calcium 2-hydroxy-1-(hydroxymethyl)ethyl phosphate, which may be hydrated. Calcium Glycerophosphate contains NLT 18.6% and NMT 19.4% of calcium (Ca), calculated on the dried basis.

IDENTIFICATION

- **A.**
Analysis: Ignite 0.1 g in a crucible. Take up the residue with 5 mL of nitric acid, heat on a water bath for 1 min, and filter. Mix 1 mL of the filtrate with 2 mL of ammonium molybdate TS.
Acceptance criteria: A yellow color develops.
- **B.**
Analysis: Dissolve 20 mg of the substance being examined in 5 mL of 5 M acetic acid, and add 0.5 mL of potassium ferrocyanide solution (53 mg/mL). The resulting solution remains clear. To the clear solution, add 50 mg of ammonium chloride.
Acceptance criteria: A white crystalline precipitate is produced.

ASSAY

- **PROCEDURE**
Sample: 200 mg
Titrimetric system
(See *Titrimetry* (541).)
Mode: Direct titration
Titrant: 0.1 M edetate disodium VS
Endpoint detection: Colorimetric
Blank: 300 mL of water. Add 6 mL of 10 M sodium hydroxide and 15 mg of calconcarboxylic acid tritrate.
Analysis: Dissolve the *Sample* in 300 mL of water, add 6 mL of 10 M sodium hydroxide and 15 mg of calconcarboxylic acid tritrate. Titrate with *Titrant* until the solution is a distinct blue color.
Calculate the percentage of calcium (Ca) in the portion of Calcium Glycerophosphate taken:

$$\text{Result} = [(V - B) \times M \times F \times 100]/W$$

V = *Sample* titrant volume (mL)
B = *Blank* titrant volume (mL)
M = titrant molarity (mM/mL)
F = equivalency factor, 40.08 mg/mM
W = weight of the *Sample* (mg)

Acceptance criteria: 18.6%–19.4% on the dried basis

IMPURITIES

- **LEAD** (251): NMT 4 ppm
- **IRON** (241)
Standard solution: Dilute 1 volume of *Standard Iron Solution*, prepared as directed in the chapter, with water to 10 volumes (1 µg/mL).
Analysis: Dissolve 0.20 g in 10 mL of water. Add 2 mL of a 20% (w/v) solution of citric acid, 0.1 mL of thioglycolic acid, and mix. Make alkaline with 10 M ammonia, dilute with water to 20 mL, and allow to stand for 5 min. Any pink color produced is not more intense than that obtained by treating 4 mL of the *Standard solution* in the same manner.
Acceptance criteria: NMT 20 ppm
- **HEAVY METALS, Method I** (231): NMT 20 ppm
- **LIMIT OF CHLORIDE**
Standard solution: 8.24 µg/mL of sodium chloride in water
Sample solution: Dissolve 125 mg in a 10-mL mixture of 5 M acetic acid and water (2:8), and dilute with water to 15 mL.
Analysis: To the *Sample solution* add 1 mL of 2 M nitric acid, then add 1 mL of a silver nitrate solution (17 mg/mL), and allow to stand for 5 min protected from light. To 10 mL of the *Standard solution* add 5 mL

of water, 1 mL of 2 M nitric acid, and 1 mL of silver nitrate solution (17 mg/mL), and allow to stand for 5 min protected from light. When viewed against a dark background, the *Sample solution* is not more turbid than the *Standard solution*.

Acceptance criteria: NMT 0.04%

- **LIMIT OF SULFATE**

Standard solution: 36.2 µg/mL of potassium sulfate in water

Sample solution: Use the *Sample solution* prepared as directed in the test for *Appearance of Solution*.

Analysis: To 15 mL of the *Standard solution* add 0.5 mL of 5 M acetic acid and 1 mL of barium chloride solution (250 mg/mL). Repeat, using 15 mL of the *Sample solution*. Allow the solutions to stand for 5 min protected from light. When viewed against a dark background, the *Sample solution* is not more turbid than the *Standard solution*.

Acceptance criteria: NMT 0.2%

- **LIMIT OF ARSENIC**

Standard stock solution: In a 250-mL volumetric flask dissolve 330 mg of arsenic trioxide in 5 mL of 2 N sodium hydroxide, and dilute with water to volume. Transfer 1 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Standard solution: Transfer 1 mL of *Standard stock solution* into a 10-mL volumetric flask, and dilute with water to volume.

Tin(II) chloride solution: Heat 20 g of tin with 85 mL of hydrochloric acid until no more hydrogen is released. Allow to cool. Dilute 1 volume of this solution with 10 volumes of dilute hydrochloric acid (200 mg/mL of hydrochloric acid in water).

Sample solution: Transfer 330 mg of Calcium Glycerophosphate to a 25.0-mL volumetric flask, and dilute with water to volume.

Apparatus: Prepare a 100-mL side-arm conical flask containing a magnetic stirring bar. Attach to the conical flask a ground-glass stopper through which passes a glass tube 20-cm long, with an internal diameter of 5 mm. The lower end of the tube is inside the conical flask and has been drawn to a tip with an internal diameter of 1 mm. An orifice 3 mm in diameter is 15 mm from the tip and at least 3 mm below the lower surface of the stopper. The upper end of the tube has a flat ground surface at a right angle to the axis of the tube. A second glass tube of the same internal diameter and 30 mm long, with a similar flat ground surface, is placed in contact with the ground surface of the first tube and is held in position by a clamp and springs. Into the lower tube, insert 55 mg of loosely packed lead acetate cotton. Place a disk of mercuric bromide paper between the flat surfaces of the tubes.

Analysis: Before placing the tube assembly into the flask, transfer the *Sample solution* to the flask, and add 15.0 mL of hydrochloric acid, 0.1 mL of *Tin(II) chloride solution*, and 5 mL of potassium iodide TS. Allow to stand for 15 min, and add 5 g of activated zinc. Assemble the apparatus immediately, and immerse the flask in a water bath at a temperature such that a uniform evolution of gas is maintained. After not less than 2 h, examine the stain produced on the mercuric bromide paper. Perform the same procedure using 1.0 mL of the *Standard solution*. The stain produced on the mercuric bromide paper by the *Sample solution* is not more intense than that produced by the *Standard solution*.

Acceptance criteria: NMT 3 ppm

- **LIMIT OF PHOSPHATES**

Sulfomolybdic solution: Dissolve with heating 2.5 g of ammonium molybdate in 20 mL of water. Dilute 28 mL of sulfuric acid with 50 mL of water, and cool. Mix the two solutions, and dilute with water to 100 mL.

Tin(II) chloride solution: Prepare as directed in the test for *Limit of Arsenic*.

Standard stock solution: 14.3 µg/mL of monobasic potassium phosphate in water.

Standard solution: Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 2.5 mL of the *Sample solution* from the test for *Appearance of Solution* to a 100-mL volumetric flask, and dilute with water to volume.

Analysis: To 100 mL of the *Sample solution* add 4 mL of *Sulfomolybdic solution*, mix, and add 0.1 mL of *Tin(II) chloride solution*. To 100 mL of the *Standard solution*, add 4 mL of *Sulfomolybdic solution*, mix, and add 0.1 mL of *Tin(II) chloride solution*. Allow the preparations to stand for 10 min, then examine 20 mL of each preparation. Any color produced by the *Sample solution* is not more intense than that produced by the *Standard solution*.

Acceptance criteria: NMT 0.04%

- **CITRIC ACID**

Mercury(II) sulfate solution: 1 g of mercuric oxide in 20 mL of water and 4 mL of sulfuric acid

Analysis: Mix 5 g of Calcium Glycerophosphate with 20 mL of carbon dioxide-free water, and filter. To the filtrate add 0.15 mL of sulfuric acid, and filter. To the filtrate add 5 mL of *Mercury(II) sulfate solution*, and heat to boiling. Add 0.5 mL of 0.2 M potassium permanganate, and heat to boiling.

Acceptance criteria: No precipitate is formed.

- **GLYCEROL AND ALCOHOL-SOLUBLE SUBSTANCES**

Analysis: Mix 1 g with 25 mL of alcohol, and shake for 1 min. Filter, evaporate the filtrate to dryness on a water bath, and dry the residue at 70° for 1 h.

Acceptance criteria: The residue weighs NMT 5 mg (0.5%).

SPECIFIC TESTS

- **APPEARANCE OF SOLUTION**

Opalescent suspension: Dissolve 1 g of hydrazine sulfate in 100 mL of water and allow to stand for 4–6 h. Add 25 mL of this solution to 25 mL of a solution containing 100 mg/mL of methenamine in water, and allow to stand for 24 h.

Primary reference suspension: Dilute 15.0 mL of the *Opalescent suspension* with water to 1000 mL. [NOTE—This suspension is freshly prepared and may be stored for NMT 24 h.]

Reference suspension: *Primary reference suspension* and water (30:70). [NOTE—Shake before using.]

Sample solution: Dissolve 1.5 g at room temperature in 150 mL of carbon dioxide-free water.

Analysis: Compare the opalescence of equal volumes of the *Sample solution* and the *Reference suspension*.

Acceptance criteria: The *Sample solution* is not more opalescent than the *Reference suspension*.

- **ACIDITY OR ALKALINITY**

Analysis: Dissolve 1 g of Calcium Glycerophosphate in 100 mL of water. Add 0.1 mL of 1.0% (w/v) phenolphthalein solution.

Acceptance criteria: NMT 0.5 mL of 0.1 M sodium hydroxide or 0.1 M hydrochloric acid is required to change the color of the indicator.

- **LOSS ON DRYING (731):** Dry a sample at 150° for 4 h: it loses NMT 12.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

Calcium with Vitamin D Tablets

DEFINITION

Calcium with Vitamin D Tablets contain NLT 90.0% and NMT 125.0% of the labeled amount of calcium (Ca), derived from substances generally recognized as safe, and NLT 90.0% and NMT 165.0% of the labeled amount of Vitamin D, as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O). They contain no other vitamins or minerals for which nutritional value is claimed. They may contain other labeled added substances or additional ingredients in amounts that are unobjectionable.

STRENGTH

- **CALCIUM** [NOTE—A commercially available atomic absorption standard solution for calcium may be used where preparation of a *Calcium standard stock solution* is described in the following assay. Concentrations of the *Standard solutions* and the *Sample stock solution* may be modified to fit the linear or working range of the instrument.]
Lanthanum chloride solution: Dissolve 26.7 g of lanthanum chloride in 0.125 N hydrochloric acid to make 100 mL.
Calcium standard stock solution: Weigh 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, and dissolve in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL to obtain a solution having a concentration of 400 µg/mL of calcium.
Standard stock solution: 100 µg/mL of calcium from a volume of *Calcium standard stock solution* in 0.125 N hydrochloric acid
Standard solutions: Into separate 100-mL volumetric flasks, separately pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and obtain *Standard solutions* having concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.
Sample stock solution: Weigh and finely powder NLT 20 Tablets. Transfer the equivalent to 500 mg of calcium, in 25 mL of concentrated hydrochloric acid, and heat for 30 min on a steam bath. Cool, dilute with water to 1000 mL, and filter.
Sample solution: Quantitatively dilute a volume of *Sample stock solution* with 0.125 N hydrochloric acid to obtain a concentration of 100 µg/mL of calcium. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume.
Spectrometric conditions
 (See *Spectrophotometry and Light-Scattering* (851).)
Mode: Atomic absorption spectrophotometer
Lamp: Calcium hollow-cathode
Flame: Nitrous oxide–acetylene
Analytical wavelength: Calcium emission line, 422.7 nm
Blank: 1 mL of *Lanthanum chloride solution* per 100 mL of 0.125 N hydrochloric acid
Analysis
Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions, against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in µg/mL, of calcium in the *Sample solution*.
 Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

 C = measured concentration of calcium in the *Sample solution* (µg/mL)
 C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)
Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)
- **CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D)**
 [NOTE—Use low-actinic glassware throughout this procedure.]
Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)
Standard solution: 2 µg/mL of USP Ergocalciferol RS or USP Cholecalciferol RS in *n*-hexane
System suitability solution: Heat a volume of *Standard solution* at 60° for 1 h to partially isomerize vitamin D

(ergocalciferol or cholecalciferol) to its corresponding precursor.

Sample solution: Weigh, and grind NLT 20 Tablets. Transfer the equivalent to 20 µg of cholecalciferol or ergocalciferol to a container having a polytetrafluoroethylene-lined screw cap. Add 8 mL of dimethyl sulfoxide and 12 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker with tubes in a water bath maintained at 60°. Centrifuge for 10 min, withdraw the hexane layer by means of a pipet, and transfer to an evaporation flask. Add 12 mL of *n*-hexane to the dimethyl sulfoxide layer, mix on a vortex mixer for 5 min, and again withdraw the hexane layer by means of a pipet, and add to the evaporation flask. Repeat this extraction with three additional 12-mL portions of *n*-hexane, adding the hexane extracts to the evaporation flask. Evaporate the combined hexane extracts in vacuum at room temperature to dryness. Dissolve in and dilute the residue in a volume of *n*-hexane to obtain a concentration of 2 µg/mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)
 C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)
 F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

PERFORMANCE TESTS

- DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution* with respect to calcium

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Analysis: Determine the amount of calcium (Ca) dissolved, using the procedure in *Calcium*, making any necessary volumetric adjustments.

Tolerances: NLT 75% of the labeled amount of Ca is dissolved.

- WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the total combined molds and yeasts count does not exceed 300 cfu/g.
- MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- LABELING:** The label states that the product is *Calcium with Vitamin D Tablets*. The label states also the quantities of calcium and Vitamin D in terms of metric units/Tablet, and the salt form of calcium and the chemical form of Vitamin D present in the Tablet.
- USP REFERENCE STANDARDS** <11>
 USP Cholecalciferol RS
 USP Ergocalciferol RS

Calcium and Vitamin D with Minerals Tablets

DEFINITION

Calcium and Vitamin D with Minerals Tablets contain Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Calcium, and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: copper, magnesium, manganese, and zinc. Tablets contain NLT 90.0% and NMT 165.0% of the labeled amount of vitamin D, as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O), and NLT 90.0% and NMT 125.0% of the labeled amounts of calcium (Ca), copper (Cu), magnesium (Mg), manganese (Mn), and zinc (Zn). They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

- CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D)**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Ergocalciferol RS or USP Cholecalciferol RS in *n*-hexane

System suitability solution: Heat a volume of *Standard solution* at 60° for 1 h to partially isomerize vitamin D (ergocalciferol or cholecalciferol) to its corresponding precursor.

Sample solution: Weigh NLT 20 Tablets, and grind the Tablets to a fine powder. Transfer the equivalent of 20 µg of cholecalciferol or ergocalciferol to a container having a polytetrafluoroethylene-lined screw cap. Add 8 mL of dimethyl sulfoxide and 12 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker with tubes in a water bath maintained at 60°. Centrifuge for 10 min, withdraw the hexane layer by means of a pipet, and transfer to an evaporation flask. Add 12 mL of *n*-hexane to the dimethyl sulfoxide layer, mix on a vortex mixer for 5 min, and again withdraw the hexane layer by means of a pipet, and add to the evaporation flask. Repeat this extraction with three additional 12-mL portions of *n*-hexane, adding the hexane extracts to the evaporation flask. Evaporate the combined hexane extracts in vacuum at room temperature to dryness. Dissolve in and dilute the residue in a volume of *n*-hexane to obtain a concentration of 2 µg/mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 5-μm packing L8

Flow rate: 1 mL/min

Injection size: 100 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the responses for the vitamin D peaks. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak height for cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak height for cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Ergocalciferol RS or USP Cholecalciferol RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of ergocalciferol or cholecalciferol in the *Sample solution* (μg/mL)

F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• **CALCIUM, Method 1**

[NOTE—A commercially available atomic absorption standard solution for calcium may be used where preparation of a *Calcium standard stock solution* is described in the following section. Concentrations of the *Standard solutions* and the *Sample stock solution* may be modified to fit the linear or working range of the instrument.]

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard stock solution: 400 μg/mL of calcium

Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, and dissolve in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 μg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain *Standard solutions* having concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 μg/mL of calcium.

Sample stock solution: Weigh and finely powder NLT 20 Tablets. Mix a portion of the powder equivalent to a nominal amount of 500 mg of calcium with 25 mL of concentrated hydrochloric acid, and heat for 30 min on a steam bath. Cool, dilute with water to 1000 mL, and filter.

Sample solution: Quantitatively dilute a volume of the *Sample stock solution* with 0.125 N hydrochloric acid to obtain a nominal concentration of 100 μg/mL of calcium. Transfer 2.0 mL of this solution to a 100-mL

volumetric flask, add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Calcium emission line, 422.7 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution*/100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in μg/mL, of calcium, and draw the straight line best fitting the five plotted points.

From the graph, determine the concentration, in μg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (μg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of Calcium (Ca)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% (v/v) solution of nitric acid solution, and dilute with a 1% (v/v) solution of nitric acid to 1000 mL. This solution contains 1000 μg/mL of copper.

Standard stock solution: 100 μg/mL of copper from *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 μg/mL of copper.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer the equivalent of 5 mg of copper from powdered Tablets to a porcelain crucible. Heat for 6–12 h in a muffle furnace maintained at 550°, and cool. Add 15 mL of hydrochloric acid, and boil gently on a hot plate or a steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask, rinsing the crucible with portions of 6 N hydrochloric acid. Dilute the contents of the flask with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute the filtrate quantitatively with 0.125 N hydrochloric acid to obtain a concentration of 2 μg/mL of copper.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Copper hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Copper emission line, 324.7 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in μg/mL, of copper, and draw the straight line best fitting the five plotted points.

From the graph, determine the concentration, C , in μg/mL, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of Copper (Cu) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* (µg/mL)

C_U = nominal concentration of copper in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• **MAGNESIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Magnesium standard stock solution: Transfer 1.00 g of magnesium to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution having a known concentration of 1000 µg/mL.

Standard stock solution: 20 µg/mL of magnesium from *Magnesium standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 µg/mL of magnesium.

Sample solution: Finely powder NLT 20 Tablets.

Transfer the equivalent of 200 mg of magnesium to a porcelain crucible. Heat for 6–12 h in a muffle furnace maintained at 550°, and cool. Add 15 mL of hydrochloric acid, and boil gently on a hot plate or a steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask, rinsing the crucible with portions of 6 N hydrochloric acid. Dilute the contents of the flask with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute the filtrate quantitatively with 0.125 N hydrochloric acid to obtain a concentration of 0.4 µg/mL of magnesium, adding 1 mL of *Lanthanum chloride solution*/100 mL of the final volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Magnesium emission line, 285.2 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution*/100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of magnesium, and draw the straight line best fitting the five plotted points. From the graph, determine the concentration, C, in µg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* (µg/mL)

C_U = nominal concentration of magnesium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• **MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese, weighed, to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of manganese.

Standard stock solution: 50 µg/mL of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 µg/mL of manganese.

Sample solution: Finely powder NLT 20 Tablets.

Transfer the equivalent of 9 mg of manganese from powdered Tablets to a porcelain crucible. Heat for 6–12 h in a muffle furnace maintained at 550°, and cool. Add 15 mL of hydrochloric acid, and boil gently on a hot plate or a steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask, rinsing the crucible with portions of 6 N hydrochloric acid. Dilute the contents of the flask with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute the filtrate quantitatively with 0.125 N hydrochloric acid to obtain a concentration of 1 µg/mL of manganese.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Manganese emission line, 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in mg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* (µg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese

• **ZINC, Method 1**

Zinc standard stock solution: 1000 µg/mL of zinc from zinc oxide dissolved in 5 M hydrochloric acid (3.89 mg/mL), and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer the equivalent of 40 mg of zinc from powdered Tablets to a porcelain crucible. Heat for 6–12 h in a muffle furnace maintained at 550°, and cool. Add 15 mL of hydrochloric acid, and boil gently on a hot plate or a steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask, rinsing the crucible with portions of 6 N hydrochloric acid. Dilute the contents of the flask with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute the filtrate quantitatively with 0.125 N hydrochloric acid to obtain a concentration of 2 µg/mL of zinc.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Lamp: Zinc hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Zinc emission line, 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph, determine the concentration, *C*, in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

• CALCIUM, COPPER, MAGNESIUM, MANGANESE, and ZINC, Method 2

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% (v/v) nitric acid solution and 1000 mg/L of scandium in 5% (v/v) nitric acid solution with *Diluent* (1:1:198), and mix.

Standard stock solution (Ca, Cu, Mg, Mn, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% (v/v) nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% (v/v) nitric acid solution to obtain a solution having final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 500 mg/L of magnesium, 100 mg/L of manganese, and 250 mg/L of zinc.

Standard solutions: Prepare a mixture of *Standard stock solution* in *Diluent* to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion equal to the average Tablet weight to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments,

followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5-µm pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Spectrometric conditions

(See *Spectrochemistry* <730>.)

Mode: Inductively coupled plasma spectrometry, using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength.

[NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution* and obtain the response as directed for Analysis.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*. Calculate the percentage of the labeled amount for each mineral:

$$\text{Result} = C \times (V/W) \times F \times (W_T/L) \times 100$$

C = measured concentration of the relevant element in the *Sample solution* (mg/L)

V = volume of the *Sample solution* (L)

W = sample weight (mg)

F = dilution factor of the *Sample solution*

W_T = average Tablet weight (mg)

L = labeled amount of the relevant element (mg/Tablet)

Acceptance criteria: NLT 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), magnesium (Mg), manganese (Mn), and zinc (Zn).

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS <2040>: Meet the requirements for *Dissolution* with respect to calcium

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Analysis: Determine the amount of calcium (Ca) dissolved, using the procedure in the assay for *Calcium*, making any necessary volumetric adjustments.

Tolerances: NLT 75% of the labeled amount of Ca is dissolved.

• WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>: Meet the requirements

SPECIFIC TESTS

• MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the total combined molds and yeasts count does not exceed 300 cfu/g. Tablets also meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

- **ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS <2022>**: Meet the requirements of the tests for absence of *Salmonella species*, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers.
- **LABELING**: The label states that the product is *Calcium and Vitamin D with Minerals Tablets*. The label also states the quantities of each mineral and vitamin D/dosage unit, the salt form of the mineral used as the source of each element present, and the chemical form of vitamin D present in the dosage unit.
- **USP REFERENCE STANDARDS <11>**
USP Cholecalciferol RS
USP Ergocalciferol RS

Cat's Claw

DEFINITION

Cat's Claw consists of the inner bark of the stems of *Uncaria tomentosa* (Willd.) DC. (*Rubiaceae*). It contains NLT 0.3% of pentacyclic oxindole alkaloids as isopteropodine, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 100 mg of USP Powdered Cat's Claw Extract RS in 2 mL of methanol. Sonicate for 5 min, shaking occasionally, heat in a water bath at 60° for 15 min, cool, and centrifuge.

Sample solution: 5 g of powdered Cat's Claw in 10 mL of methanol. Sonicate for 5 min, shaking occasionally. Heat the mixture in a water bath at 60° for 15 min, cool, and filter.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 µm (TLC plates)

Application volume: 20 µL, as bands that are 1 cm in length

Developing solvent system: Ethyl acetate and hexane (95:5)

Spray reagent A: Dissolve 0.85 g of basic bismuth nitrate in 10 mL of glacial acetic acid and 40 mL of water by heating. Filter if necessary (Solution A). Dissolve 8 g of potassium iodide in 30 mL of water (Solution B). Mix *Solution A* and *Solution B* (1:1) to obtain a stock solution. Dilute 1 mL of the stock solution with 2 mL of glacial acetic acid and 10 mL of water. [NOTE—Use freshly mixed *Solution A* and *Solution B*.]

Spray reagent B: Use a 10% solution of sodium nitrite in water.

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatogram to a length of NLT 12 cm, and dry the plate in a current of air.

Acceptance criteria: Examine the plate under short UV light. The *Sample solution* chromatogram shows multiple zones that correspond in R_f values to those observed from the *Standard solution* chromatogram. Other zones of varying intensities may be observed in the *Sample solution*. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under daylight. The *Sample solution* chromatogram shows multiple orange-brown zones that correspond in color and R_f values to those observed in the *Standard solution* chromatogram. Other colored zones of varying intensities may be observed in the *Sample solution*.

- **B.** The *Sample solution* exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine,

and isopteropodine at retention times that correspond to those in *Standard solution A*, as obtained in the test for *Content of Pentacyclic Oxindole Alkaloids and Limit of Tetracyclic Oxindoles*.

COMPOSITION

• CONTENT OF PENTACYCLIC OXINDOLE ALKALOIDS AND LIMIT OF TETRACYCLIC OXINDOLES

Standard solution A: Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shaking for 1 min. Dilute with methanol to obtain a solution having a known concentration of about 0.5 mg of the labeled amount of total oxindole alkaloids per mL. Pass through a filter of 0.45-µm or finer pore size.

Standard solution B: 0.1 mg/mL of USP Isopteropodine RS in methanol. Pass through a nylon filter of 0.45-µm or finer pore size.

Sample solution: Accurately weigh approximately 750 mg of ground Cat's Claw, and place in a 10-mL centrifuge tube. Sonicate with 2.5 mL of methanol for 10 min. Centrifuge, and transfer this solution to a 10-mL volumetric flask. Repeat the extraction three additional times combining the extracts in the 10-mL volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 min. Pass through a nylon filter of 0.45-µm or finer pore size, discarding the first part of the filtrate.

Solution A: Prepare a filtered and degassed 10 mM pH 7.0 phosphate buffer by mixing 6 mL of 1 N sodium hydroxide, 10 mL of 1 M monobasic potassium phosphate, and sufficient water to make 1000 mL. Adjust to a pH of 7.0 ± 0.1 by adding more of either solution.

Solution B: Acetonitrile

Solution C: Methanol and glacial acetic acid (99:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	65	35	0
17	65	35	0
25	50	50	0
30	50	50	0
31	0	0	100
36	0	0	100
39	65	35	0
49	65	35	0

Chromatographic system

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm × 10-cm; end-capped 3-µm packing L1

Flow rate: 0.75 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*
Suitability requirements

Chromatogram similarity: The chromatogram obtained using *Standard solution A* is similar to the Reference Chromatogram provided with the USP Powdered Cat's Claw Extract RS.

Tailing factor: NMT 2.0 for the isopteropodine peak, *Standard solution B*

Relative standard deviation: NMT 2.0% for the isopteropodine peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to speciophylline, uncarine F, mitraphylline, isomitraphylline, rhynchophylline, isorhynchophylline, pteropodine, and isopteropodine by comparison of the chromatogram of *Standard solution A* with the Reference Chromatogram provided with the lot of the USP Powdered Cat's Claw Extract RS used.

Separately calculate the percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, rhynchophylline, isorhynchophylline, pteropodine, and isopteropodine, in the portion of Cat's Claw taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response for each relevant alkaloid from the *Sample solution*

r_s = peak response for isopteropodine from *Standard solution B*

C_s = concentration of USP Iopteropodine RS in *Standard solution B* (mg/mL)

C_u = concentration of Cat's Claw in the *Sample solution* (mg/mL)

Calculate the content of pentacyclic oxindole alkaloids by adding the percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

Calculate the content of tetracyclic oxindole alkaloids by adding the individual percentages of rhynchophylline and isorhynchophylline.

Acceptance criteria

Pentacyclic oxindole alkaloids: NLT 0.3%

Tetracyclic oxindole alkaloids: NMT 0.05%

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 10^5 /g; the total combined molds and yeasts count does not exceed 10^3 /g; and the bile-tolerant Gram-negative bacteria do not exceed 10^3 /g.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

[NOTE—The pharmacopeial article is constituted only by the stem inner bark of *U. tomentosa* (Willd.) DC. Descriptions of other parts of the plant are given to aid in the collection of the right species. Compliance should be determined using the entire monograph and not only the botanical description.]

Macroscopic: Cat's Claw is a woody vine with a main stem up to 20 cm in diameter and up to 30 m long. The branches are obtusely quadrangular and generally puberulous. Stipules in the buds are densely tomentose in the upper side (different from *U. guianensis* in which the stipules are glabrous) with the hairs, often with curved tips, meshed together and with the longer hairs of the leaf helping to connect the pair of stipules along the margins, but split when older (different from *U. guianensis* in which the stipules separate early in the bud development). Thorns are straight to sickle-shaped, not spirally twisted (different from *U. guianensis*), very pungent and woody, from 8 to 20 mm long and from 3 to 6 mm wide. When recently cut, the color of the inner bark can be whitish gray, yellowish brown, or dark red, with longitudinal fissures and persistent rhytidome. The internal part has a slightly dusty fibrous and laminar texture with a characteristic ferruginous dust and an extremely astringent taste. The terminal branches have a quadrangular section and yellowish green internal medulla.

Microscopic: The periderm with cork (phellem) is constituted by 6–8 rows of cells having walls evenly thickened, a compressed phellogen and a phellogen with 1–7 rows of sclereids. [NOTE—The periderm and phellogen should be absent in the pharmacopeial article.] The secondary cortex with concentric rings of fibers are separated by rings of parenchyma; rings of fibers are frequently interrupted by radial rows of parenchyma cells (predominately 1 cell broad) or narrow medullary rays (few cells broad), forming rectangular bundles of fibers in a regular network. In longitudinal view, the fibers appear with numerous conspicuous pits; calcium oxalate microcrystals (sand-like) are abundant in the parenchyma, but usually absent as large polyhedral crystals or in the form of styloids with bifurcated endings, the latter forms typically present in the parenchyma of *U. guianensis*; a brown substance is dispersed in parenchyma cells; starch is abundant, granules are solitary (circular in outline, up to 10 μ m in diameter) or compound (2–3 components up to 15 μ m in diameter).

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 2.0%
- **LOSS ON DRYING** (731): Dry at 105° for 2 h: it loses NMT 7.0% of its weight.

- **USP REFERENCE STANDARDS** (11)
USP Iopteropodine RS
USP Powdered Cat's Claw Extract RS

Powdered Cat's Claw

DEFINITION

Powdered Cat's Claw is Cat's Claw reduced to a powder or very fine powder. It contains NLT 0.3% of pentacyclic oxindole alkaloids as isopteropodine, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 100 mg of USP Powdered Cat's Claw Extract RS in 2 mL of methanol. Sonicate for 5 min, shaking occasionally, heat in a water bath at 60° for 15 min, cool, and centrifuge.

Sample solution: 5 g of Powdered Cat's Claw in 10 mL of methanol. Sonicate for 5 min, shaking occasionally. Heat the mixture in a water bath at 60° for 15 min, cool, and filter.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)

Application volume: 20 μ L, as bands that are 1 cm in length

Developing solvent system: Ethyl acetate and hexane (95:5)

Spray reagent A: Dissolve 0.85 g of basic bismuth nitrate in 10 mL of glacial acetic acid and 40 mL of water by heating. Filter if necessary (Solution A). Dissolve 8 g of potassium iodide in 30 mL of water (Solution B). Mix *Solution A* and *Solution B* (1:1) to obtain a stock solution. Dilute 1 mL of the stock solution with 2 mL of

glacial acetic acid and 10 mL of water. [NOTE—Use freshly mixed *Solution A* and *Solution B*.]

Spray reagent B: Use a 10% solution of sodium nitrite in water.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram to a length of NLT 12 cm, and dry the plate in a current of air.

Acceptance criteria: Examine the plate under short UV light. The *Sample solution* chromatogram shows multiple zones that correspond in R_f values to those observed from the *Standard solution* chromatogram. Other zones of varying intensities may be observed in the *Sample solution*. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under daylight. The *Sample solution* chromatogram shows multiple orange-brown zones that correspond in color and R_f values to those observed in the *Standard solution* chromatogram. Other colored zones of varying intensities may be observed in the *Sample solution*.

- **B.** The *Sample solution* exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in *Standard solution A*, as obtained in the test for *Content of Pentacyclic Oxindole Alkaloids and Limit of Tetracyclic Oxindoles*.

COMPOSITION

• CONTENT OF PENTACYCLIC OXINDOLE ALKALOIDS AND LIMIT OF TETRACYCLIC OXINDOLES

Standard solution A: Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shaking for 1 min. Dilute with methanol to obtain a solution having a known concentration of about 0.5 mg of the labeled amount of total oxindole alkaloids per mL. Pass through a filter of 0.45- μ m or finer pore size.

Standard solution B: 0.1 mg/mL of USP Isopteropodine RS in methanol. Pass through a nylon filter of 0.45- μ m or finer pore size.

Sample solution: Accurately weigh approximately 750 mg of Powdered Cat's Claw, and place in a 10-mL centrifuge tube. Sonicate with 2.5 mL of methanol for 10 min. Centrifuge, and transfer this solution to a 10-mL volumetric flask. Repeat the extraction three additional times combining the extracts in the 10-mL volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 min. Pass through a nylon filter of 0.45- μ m or finer pore size, discarding the first part of the filtrate.

Solution A: Prepare a filtered and degassed 10 mM pH 7.0 phosphate buffer by mixing 6 mL of 1 N sodium hydroxide, 10 mL of 1 M monobasic potassium phosphate, and sufficient water to make 1000 mL. Adjust to a pH of 7.0 ± 0.1 by adding more of either solution.

Solution B: Acetonitrile

Solution C: Methanol and glacial acetic acid (99:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)

Powdered Cat's Claw Extract

DEFINITION

Powdered Cat's Claw Extract is prepared from Cat's Claw by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of plant material to extract is between 4:1 to 6:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of pentacyclic oxindole alkaloids as isopteropodine, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. It may contain suitable added substances.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 100 mg of USP Powdered Cat's Claw Extract RS in 2 mL of methanol. Sonicate for 5 min, shaking occasionally, heat in a water bath at 60° for 15 min, cool, and centrifuge.

Sample solution: Shake a quantity of Powdered Extract, equivalent to about 25 mg of the labeled amount of pentacyclic oxindole alkaloids, in 20 mL of methanol. Allow to stand for 15 min before use.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)

Application volume: 20 μL , as bands that are 1 cm in length

Developing solvent system: Ethyl acetate and hexane (95:5)

Spray reagent A: Dissolve 0.85 g of basic bismuth nitrate in 10 mL of glacial acetic acid and 40 mL of water by heating. Filter if necessary (Solution A). Dissolve 8 g of potassium iodide in 30 mL of water (Solution B). Mix Solution A and Solution B (1:1) to obtain a stock solution. Dilute 1 mL of the stock solution with 2 mL of glacial acetic acid and 10 mL of water. [NOTE—Use freshly mixed Solution A and Solution B.]

Spray reagent B: Use a 10% solution of sodium nitrite in water.

Analysis

Samples: Standard solution and Sample solution
Develop the chromatogram to a length of NLT 12 cm, and dry the plate in a current of air.

Acceptance criteria: Examine the plate under short UV light. The Sample solution chromatogram shows multiple zones that correspond in R_f values to those observed from the Standard solution chromatogram. Other zones of varying intensities may be observed in the Sample solution. Spray the plate with Spray reagent A followed by Spray reagent B, and examine the plate under daylight. The Sample solution chromatogram shows multiple orange-brown zones that correspond in

color and R_f values to those observed in the Standard solution chromatogram. Other colored zones of varying intensities may be observed in the Sample solution.

- **B.** The chromatogram of the Sample solution exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those of Standard solution A, as obtained in the test for Content of Pentacyclic Oxindole Alkaloids and Limit of Tetracyclic Oxindole Alkaloids. The sum of the peak areas for the tetracyclic oxindole alkaloids rhynchophylline and isorhynchophylline is less than 25% of the total peak areas detected for pentacyclic oxindole alkaloids.

COMPOSITION

• CONTENT OF PENTACYCLIC OXINDOLE ALKALOIDS AND LIMIT OF TETRACYCLIC OXINDOLES

Standard solution A: Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shaking for 1 min. Dilute with methanol to obtain a solution having a known concentration of about 0.5 mg of the labeled amount of total oxindole alkaloids per mL. Pass through a filter of 0.45- μm or finer pore size.

Standard solution B: 0.1 mg/mL of USP Isopteropodine RS in methanol. Pass through a nylon filter of 0.45- μm or finer pore size.

Sample solution: Transfer an accurately weighed quantity of Powdered Extract, equivalent to about 5 mg of the labeled content of pentacyclic oxindole alkaloids, to a 10-mL centrifuge tube. Add 2.5 mL of methanol, and sonicate for 10 min. Centrifuge, and transfer the supernatant to a 10-mL volumetric flask. Repeat the extraction three additional times combining the extracts in the 10-mL volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 min. Pass through a nylon filter of 0.45- μm or finer pore size, discarding the first part of the filtrate.

Solution A: Prepare a filtered and degassed 10 mM pH 7.0 phosphate buffer by mixing 6 mL of 1 N sodium hydroxide, 10 mL of 1 M monobasic potassium phosphate, and sufficient water to make 1000 mL. Adjust to a pH of 7.0 \pm 0.1 by adding more of either solution.

Solution B: Acetonitrile

Solution C: Methanol and glacial acetic acid (99:1)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	65	35	0
17	65	35	0
25	50	50	0
30	50	50	0
31	0	0	100
36	0	0	100
39	65	35	0
49	65	35	0

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm \times 10-cm; end-capped 3- μm packing L1

Flow rate: 0.75 mL/min

Injection size: 10 μL

System suitability

Samples: Standard solution A and Standard solution B

Suitability requirements

Chromatogram similarity: The chromatogram obtained using Standard solution A is similar to the Ref-

erence Chromatogram provided with the USP Powdered Cat's Claw Extract RS being used.

Tailing factor: NMT 2.0 for the isopteropodine peak, *Standard solution B*

Relative standard deviation: NMT 2.0% for the isopteropodine peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to speciophylline, uncarine F, mitraphylline, isomitraphylline, rhynchophylline, isorhynchophylline, pteropodine, and isopteropodine by comparison of the chromatogram of *Standard solution A* with the Reference Chromatogram provided with the lot of the USP Powdered Cat's Claw Extract RS used.

Separately calculate the percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, rhynchophylline, isorhynchophylline, pteropodine, and isopteropodine, as isopteropodine, in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each relevant alkaloid from the *Sample solution*

r_S = peak response for isopteropodine from *Standard solution B*

C_S = concentration of USP Isopteropodine RS in *Standard solution B* (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of pentacyclic oxindole alkaloids in the Powdered Extract:

$$\text{Result} = (\Sigma PA/L) \times 100$$

ΣPA = sum of percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine (%)

L = labeled amount of pentacyclic alkaloids as isopteropodine (%)

Calculate the content of tetracyclic oxindole alkaloids by adding the individual percentages of rhynchophylline and isorhynchophylline.

Acceptance criteria

Pentacyclic oxindole alkaloids: 90.0%–110.0% of the labeled amount on the dried basis

Tetracyclic oxindole alkaloids: NMT 25% of the labeled amount of pentacyclic oxindole alkaloids on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method II (231):** NMT 10 ppm
- **MICROBIAL ENUMERATION TESTS (2021):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 10^4 /g, and the total combined molds and yeasts count does not exceed 10^3 /g.
- **OTHER REQUIREMENTS:** It meets the requirements for *Botanical Extracts (565)*, *Residual Solvents* and *Pesticide Residues*.

SPECIFIC TESTS

- **LOSS ON DRYING (731):** Dry 1 g at 105° for 2 h: it loses NMT 10.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of pentacyclic oxindole alkaloids, the

extracting solvent or solvent mixture used for preparation, and the ratio of the starting crude plant material to Powdered Extract. It meets the requirements for *Botanical Extracts (565)*, *Labeling*.

• USP REFERENCE STANDARDS (11)

USP Isopteropodine RS

USP Powdered Cat's Claw Extract RS

Cat's Claw Capsules

DEFINITION

Cat's Claw Capsules contain Powdered Cat's Claw Extract.

Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of Powdered Extract, calculated as pentacyclic oxindole alkaloids.

IDENTIFICATION

- The *Sample solution* chromatogram exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in *Standard solution A*, as obtained in the test for *Content of Pentacyclic Oxindole Alkaloids and Limit of Tetracyclic Oxindole Alkaloids*. The content of tetracyclic oxindole alkaloids, calculated as the sum of rhynchophylline and isorhynchophylline, is NMT 25% of the labeled amount of pentacyclic oxindole alkaloids.

STRENGTH

• CONTENT OF PENTACYCLIC OXINDOLE ALKALOIDS AND LIMIT OF TETRACYCLIC OXINDOLE ALKALOIDS

Solution A: Prepare a 10 mM pH 7.0 phosphate buffer by mixing 1 N sodium hydroxide, 1 M monobasic potassium phosphate, and water (3:5:492), and adjust to a pH of 7.0 ± 0.1 by adding more of either solution.

Solution B: Acetonitrile

Solution C: Methanol and glacial acetic acid (99:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	65	35	0

31	0	0	100
36	0	0	100
39	65	35	0
49	65	35	0

Standard solution A: Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shake for 1 min, and dilute with methanol to obtain a solution having a known concentration of about 0.5 mg/mL of the labeled amount of total oxindole alkaloids. Pass through a filter of 0.45-μm or finer pore size.

Standard solution B: 0.1 mg/mL of USP Isopteropodine RS in methanol. Pass through a nylon filter of 0.45-μm or finer pore size.

Sample solution: Accurately weigh the contents of not fewer than 20 Capsules and pulverize. Transfer an accurately weighed quantity of the powder, equivalent to 20 mg of the labeled amount of pentacyclic oxindole alkaloids, to a 50-mL centrifuge tube. Sonicate with 10 mL of methanol for 10 min. Centrifuge and transfer this solution to a 50-mL volumetric flask. Repeat the above extraction three more times, combining the extracts in the 50-mL volumetric flask, and dilute with methanol to volume. Transfer 3 mL of the solution to a

test tube containing 300 mg of polyamide powder, and shake for 1 min. Pass through a nylon filter of 0.45- μ m or finer pore size, and discard the first part of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm \times 10-cm; endcapped 3- μ m packing L1

Flow rate: 0.75 mL/min

Injection size: 10 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained using *Standard solution A* is similar to the Reference Chromatogram provided with the USP Powdered Cat's Claw Extract RS being used.

Tailing factor: NMT 2.0 for the isopteropodine peak, *Standard solution B*

Relative standard deviation: NMT 2.0% from the isopteropodine peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, isopteropodine, rhynchophylline, and isorhynchophylline by comparison of the chromatogram of *Standard solution A* with the Reference Chromatogram provided with the lot of the USP Powdered Cat's Claw Extract RS being used.

Calculate the content, in mg, of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine, as isopteropodine, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V$$

r_U = peak response for each relevant alkaloid from the *Sample solution*

r_S = peak response for isopteropodine from *Standard solution B*

C_S = concentration of USP Isopteropodine RS in *Standard solution B* (mg/mL)

V = final dilution volume of the *Sample solution* (mL)

Calculate the content, in mg, of total pentacyclic oxindole alkaloids (C_C) in the portion of Capsules taken by adding the individual contents of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. Calculate the percentage of Powdered Cat's Claw Extract with respect to the label claim:

$$\text{Result} = C_C \times (A_{WC}/W) \times (100/L_E) \times (100/L)$$

C_C = content of total pentacyclic oxindole alkaloids in the portion of Capsules taken (mg)

A_{WC} = average weight of Capsules contents (mg/Capsule)

W = weight of the portion of Capsules taken (mg)

L_E = content of total pentacyclic oxindole alkaloids, mg, in 100 mg of the Extract used to prepare the Capsules

L = amount of Extract per Capsule according to label claim (mg/Capsule)

Calculate the percentage of tetracyclic oxindole alkaloids with respect to the content of pentacyclic oxindole alkaloids in the portion of Capsules taken:

$$\text{Result} = (r_T/r_P) \times 100$$

r_T = sum of peak responses for rhynchophylline and isorhynchophylline in the chromatogram of the *Sample solution*

r_P = sum of peak responses for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine and isopteropodine in the chromatogram of the *Sample solution*

Acceptance criteria: 90.0%–110.0% of the labeled amount of Powdered Extract calculated as pentacyclic oxindole alkaloids; and NMT 25% of tetracyclic oxindole alkaloids with respect to the labeled amount of pentacyclic oxindole alkaloids is found.

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS

<2040>: Meets the requirements for *Disintegration*

• WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:

Meets the requirements

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. If prepared with Extract, the label also indicates the quantity, in mg, of Extract per Capsule and the content, in mg, of pentacyclic oxindole alkaloids per 100 mg of Powdered Extract.

• USP REFERENCE STANDARDS <11>

USP Isopteropodine RS

USP Powdered Cat's Claw Extract RS

Cat's Claw Tablets

DEFINITION

Cat's Claw Tablets contain Powdered Cat's Claw Extract. Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of Powdered Extract, calculated as pentacyclic oxindole alkaloids.

IDENTIFICATION

• The *Sample solution* chromatogram exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in *Standard solution A*, as obtained in the test for *Content of Pentacyclic Oxindole Alkaloids and Limit of Tetracyclic Oxindole Alkaloids*. The content of tetracyclic oxindole alkaloids, calculated as the sum of rhynchophylline and isorhynchophylline, is NMT 25% of the labeled amount of pentacyclic oxindole alkaloids.

STRENGTH

• CONTENT OF PENTACYCLIC OXINDOLE ALKALOIDS AND LIMIT OF TETRACYCLIC OXINDOLE ALKALOIDS

Solution A: Prepare a 10 mM pH 7.0 phosphate buffer by mixing 1 N sodium hydroxide, 1 M monobasic potassium phosphate, and water (3:5:492), and adjust to a pH of 7.0 ± 0.1 by adding more of either solution.

Solution B: Acetonitrile

Solution C: Methanol and glacial acetic acid (99:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	65	35	0
17	65	35	0
25	50	50	0
30	50	50	0
31	0	0	100
36	0	0	100
39	65	35	0
49	65	35	0

Standard solution A: Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shake for 1 min, and dilute with methanol to obtain a solution having a known concentration of about 0.5 mg/mL of the labeled amount of total oxindole alkaloids. Pass through a filter of 0.45- μ m or finer pore size.

Standard solution B: 0.1 mg/mL of USP Isopteropodine RS in methanol. Pass through a nylon filter of 0.45- μ m or finer pore size.

Sample solution: Accurately weigh not fewer than 20 Tablets and pulverize. Transfer an accurately weighed quantity of the powder, equivalent to 20 mg of the labeled amount of pentacyclic oxindole alkaloids, to a 50-mL centrifuge tube. Sonicate with 10 mL of methanol for 10 min. Centrifuge and transfer this solution to a 50-mL volumetric flask. Repeat the above extraction three more times, combining the extracts in the 50-mL volumetric flask, and dilute with methanol to volume. Transfer 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 min. Pass through a nylon filter of 0.45- μ m or finer pore size, and discard the first part of the filtrate.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm \times 10-cm; endcapped 3- μ m packing L1

Flow rate: 0.75 mL/min

Injection size: 10 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*
Suitability requirements

Chromatogram similarity: The chromatogram obtained using *Standard solution A* is similar to the Reference Chromatogram provided with the USP Powdered Cat's Claw Extract RS being used.

Tailing factor: NMT 2.0 for the isopteropodine peak, *Standard solution B*

Relative standard deviation: NMT 2.0% from the isopteropodine peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, isopteropodine, rhynchophylline, and isorhynchophylline by comparison of the chromatogram of *Standard solution A* with the Reference Chromatogram provided with the lot of the USP Powdered Cat's Claw Extract RS being used.

Calculate the content, in mg, of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine,

and isopteropodine, as isopteropodine, in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V$$

r_U = peak response for each relevant alkaloid from the *Sample solution*

r_S = peak response for isopteropodine from *Standard solution B*

C_S = concentration of USP Isopteropodine RS in *Standard solution B* (mg/mL)

V = final dilution volume of the *Sample solution* (mL)

Calculate the content, in mg, of total pentacyclic oxindole alkaloids (C_T) in the portion of Tablets taken by adding the individual contents of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

Calculate the percentage of Powdered Cat's Claw Extract with respect to the label claim:

$$\text{Result} = C_T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

C_T = content of total pentacyclic oxindole alkaloids in the portion of Tablets taken (mg)

A_{WT} = average weight of Tablets (mg/Tablet)

W = weight of the portion of Tablets taken (mg)

L_E = content of total pentacyclic oxindole alkaloids, mg, in 100 mg of the Extract used to prepare the Tablets

L = amount of Extract per Tablet according to label claim (mg/Tablet)

Calculate the percentage of tetracyclic oxindole alkaloids with respect to the content of pentacyclic oxindole alkaloids in the portion of Tablets taken:

$$\text{Result} = (r_T/r_P) \times 100$$

r_T = sum of peak responses for rhynchophylline and isorhynchophylline in the chromatogram of the *Sample solution*

r_P = sum of peak responses for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine and isopteropodine in the chromatogram of the *Sample solution*

Acceptance criteria: 90.0%–110.0% of the labeled amount of Powdered Extract calculated as pentacyclic oxindole alkaloids; and NMT 25% of tetracyclic oxindole alkaloids with respect to the labeled amount of pentacyclic oxindole alkaloids is found.

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS

<2040>: Meets the requirements for *Disintegration*

• WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:

Meets the requirements

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count does not exceed 10^4 cfu/g. The total combined molds and yeasts count does not exceed 10^3 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the article from which Tablets were prepared. The label also indicates the quantity of Powdered Extract per Tablet, in mg. Label Tablets to indicate the content, in mg, of pentacyclic oxindole alkaloids per 100 mg of Powdered Extract.

- **USP REFERENCE STANDARDS** <11>
USP Isopteropodine RS
USP Powdered Cat's Claw Extract RS

Centella asiatica

DEFINITION

Centella asiatica consists of the dried aerial parts of *Centella asiatica* (L.) Urb. [Syn: *Hydrocotyle asiatica* L.] (Fam. Apiaceae). It is also known in commerce as gotu kola. It contains NLT 2.0% of triterpene derivatives, calculated on the dried basis.

IDENTIFICATION

- **A.** *Centella asiatica* meets the requirements for *Specific Tests, Botanic Characteristics*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution A: 0.5 mg/mL of USP Asiaticoside RS in methanol

Standard solution B: 10 mg/mL of USP Powdered *Centella asiatica* Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: About 0.5 g of *Centella asiatica*, finely powdered, in 5 mL of methanol. Sonicate for 10 min, centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates) or with an average particle size of 5 µm (HPTLC plates)

Application volume: 10 µL (TLC plates) or 4 µL (HPTLC plates)

Developing solvent system: A mixture of methylene chloride, methanol, and water (14:6:1)

Spray reagent: A solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 3 min at 120°, and examine under visible light.

Acceptance criteria: The *Sample solution* chromatogram exhibits a violet band in the lower third of the plate due to asiaticoside, corresponding in color and R_f to that in *Standard solution A*; a violet band due to madecassoside at an R_f lower than that of asiaticoside; and two additional violet bands in the upper third of the plate due to asiatic acid and madecassic acid. Bands detected in the *Sample solution* correspond in position and color to bands in *Standard solution B*. Other minor bands may be observed in the *Sample solution* and *Standard solution B*.

- **C. HPLC IDENTIFICATION TEST:** The *Sample solution* chromatogram from the test for *Content of Triterpene Derivatives* shows a peak at the retention time corresponding to that of asiaticoside in *Standard solution A*. Identify other triterpene derivative peaks in the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used. The *Sample solution* shows additional peaks corresponding to madecassoside and asiaticoside B (these two peaks may co-elute), madecassic acid, terminolic acid, and asiatic acid.

COMPOSITION

- **CONTENT OF TRITERPENE DERIVATIVES**

Solution A: Dilute 3 mL of phosphoric acid with water to 1000 mL, mix, filter, and degas.

Solution B: Acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	78	22
65	45	55
66	5	95
75	5	95
76	78	22
85	78	22

Standard solution A: 0.05 mg/mL of USP Asiaticoside RS in methanol

Standard solution B: Sonicate a portion of USP Powdered *Centella asiatica* Extract RS in methanol to obtain a solution with a concentration of about 5.0 mg/mL. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Sample stock solution: Transfer about 1.0 g of *Centella asiatica*, finely powdered and accurately weighed, to a Soxhlet apparatus. Add 100 mL of methanol, extract for 8 h, cool, and dilute with methanol to 100 mL. Pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate. [NOTE—Use a thimble of a suitable size such that the volume of methanol used in the Soxhlet extraction is at least twice the volume of the thimble.]

Sample solution: Dilute 5.0 mL of *Sample stock solution* with methanol to 10 mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*
Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used.

Tailing factor: Between 0.8 and 2.0 for the asiaticoside peak, *Standard solution A*

Resolution: NLT 1.5 between the madecassic acid and terminolic acid peaks, *Standard solution B*

Relative standard deviation: NMT 2.0% determined from the asiaticoside peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*. [NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 48 h at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used, identify the retention times of the peaks corresponding to different triterpene derivatives. The approximate relative retention times of the different triterpene derivatives are provided in the following table.

Analyte	Approximate Relative Retention Time
Madecassoside	0.71
Asiaticoside B	0.72
Asiaticoside	1.00
Madecassic acid	2.40

Analyte	Approximate Relative Retention Time
Terminolic acid	2.44
Asiatic acid	3.12

Separately calculate the percentages of the sum of madecassoside and asiaticoside B (these two peaks may co-elute), asiaticoside, the sum of madecassic acid and terminolic acid, and asiatic acid in the portion of *Centella asiatica* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times F \times 100$$

- r_U = peak response of the triterpene derivative(s) from the *Sample solution*
 r_S = peak response(s) of asiaticoside from *Standard solution A*
 C_S = concentration of USP Asiaticoside RS in *Standard solution A* (mg/mL)
 V = final volume of *Sample stock solution* (mL)
 W = weight of *Centella asiatica* used to prepare *Sample stock solution* (mg)
 D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*
 F = conversion factors for analytes: 1.00 for asiaticoside, 1.017 for the sum of madecassoside and asiaticoside B, 0.526 for the sum of madecassic acid and terminolic acid, and 0.509 for asiatic acid

Acceptance criteria: Add the percentages of different triterpene derivatives: NLT 2.0% on the dried basis.

CONTAMINANTS

- **HEAVY METALS, Method III (231):** NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis (561):** Meets the requirements
- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined yeasts and molds count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: Stem is slender, yellowish-brown, with long internodes, rooting at nodes; leaves are grayish-green, simple, alternate or grouped together at the nodes, reniform or oblong-elliptic, have palmate venation, usually with 7 veins, apex obtuse, margin crenate, base cordate, variable in size, 1–4 cm long, 2–4 cm and sometimes up to 7 cm wide, young leaves show a few trichomes on the lower surface and adult leaves are glabrous; petioles are long, grooved, base wider and sheathing; the inflorescence, if present, is a single umbel and consists of 3 flowers, rarely 2 or 4; the flowers are very small (about 2 mm), pentamerous, and have an inferior ovary; the fruit, brownish-gray, orbicular cremocarp, up to 5 mm long, is very flattened laterally and has 7–9 prominent curved ridges. Pharmacopeial article is green to yellowish-green masses composed mostly of leaves and stems fragments; odor slight; taste slightly bitter to sweet.

Histology

Transverse section of stems: Epidermal layer, subrounded or subsquare cells; 2–4 layers of collenchyma cells; 6–8 layers of thin-wall parenchyma cells with intercellular spaces; 6–7 collateral vascular bundles, xylem vessels radially arranged, slightly lignified fiber groups occurring outside the phloem; pith large, composed of thin-wall parenchyma cells; secretory canals, composed of 5–7 secretory cells, observed in cortex and medullary rays

Transverse section of leaves: Upper and lower epidermis; mesophyll composed of parenchyma cells, some contain crystals of calcium oxalate; 2–3 layers of collenchyma present in the midrib region next to both epidermal layers; vascular bundles in the center with xylem on the ventral side and phloem on the dorsal side. Transverse section of petioles has a U shape, showing an upper and a lower epidermis, followed by 2–3 layers of collenchyma next to both epidermal layers; a broad parenchymatous zone, some cells contain crystals of calcium oxalate; 7 vascular bundles forming a U shape in the parenchymatous zone, the two present in the projecting arms being less developed

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 7.0%, of which NMT 5.0% is of underground organs and NMT 2% is of other foreign matter
- **LOSS ON DRYING (731):** Dry 1.0 g of finely powdered *Centella asiatica* at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 12%, determined on 1.0 g of finely powdered *Centella asiatica*
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 3.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article. The label states that the article is exempted from the requirements of the *General Notices* with respect to the pregnancy and lactation statement (section 10.40.50, *Labeling Botanical-Containing Products*).
- **USP REFERENCE STANDARDS (11)**
 USP Asiaticoside RS
 USP Powdered *Centella asiatica* Extract RS

Powdered *Centella asiatica*

DEFINITION

Powdered *Centella asiatica* is *Centella asiatica* reduced to a powder or very fine powder. It contains NLT 2.0% of triterpene derivatives, calculated on the dried basis.

IDENTIFICATION

- **A.** Powdered *Centella asiatica* meets the requirements for *Specific Tests, Botanic Characteristics*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution A: 0.5 mg/mL of USP Asiaticoside RS in methanol
Standard solution B: 10 mg/mL of USP Powdered *Centella asiatica* Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.
Sample solution: About 0.5 g of Powdered *Centella asiatica* in 5 mL of methanol. Sonicate for 10 min, centrifuge, and use the supernatant.
Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates) or with an average particle size of 5 μm (HPTLC plates)
Application volume: 10 μL (TLC plates) or 4 μL (HPTLC plates)
Developing solvent system: A mixture of methylene chloride, methanol, and water (14:6:1)
Spray reagent: A solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh.]
Analysis
Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. - **USP REFERENCE STANDARDS** (11)
USP Asiaticoside RS
USP Powdered *Centella asiatica* Extract RS

Powdered *Centella asiatica* Extract

DEFINITION

Powdered *Centella asiatica* Extract is prepared from *Centella asiatica* by extraction with alcohol, methanol, acetone, or a mixture of these solvents. The ratio of plant material to extract is between 65:1 and 30:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of triterpene derivatives; the labeled amount of triterpene derivatives is NMT 40%, calculated on the dried basis as the sum of madecassoside, asiaticoside B, asiaticoside, madecassic acid, terminolic acid, and asiatic acid. It may contain suitable added substances as carriers.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution A: 0.5 mg/mL of USP Asiaticoside RS in methanol
Standard solution B: 10 mg/mL of USP Powdered *Centella asiatica* Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.
Sample solution: Transfer an amount of Powdered *Centella asiatica* Extract equivalent to about 5 mg of triterpene derivatives to a centrifuge tube. Add 5 mL of methanol, sonicate for 10 min, centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μ m (TLC plates) or with an average particle size of 5 μ m (HPTLC plates)

Application volume: 10 μ L (TLC plates) or 4 μ L (HPTLC plates)

Developing solvent system: A mixture of methylene chloride, methanol, and water (14:6:1)

Spray reagent: A solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, heat for 3 min at 120°, and examine under visible light.

Acceptance criteria: The *Sample solution* chromatogram exhibits a violet band in the lower third of the plate due to asiaticoside, corresponding in color and R_f to that in *Standard solution A*; a violet band due to madecassoside at an R_f lower than that of asiaticoside; and two additional violet bands in the upper third of the plate due to asiatic acid and madecassic acid. Bands detected in the *Sample solution* correspond in position and color to bands in *Standard solution B*. Other minor bands may be observed in the *Sample solution* and *Standard solution B*.

- **B. HPLC IDENTIFICATION TEST**: The *Sample solution* chromatogram from the test for *Content of Triterpene Derivatives* shows a peak at the retention time corresponding to that of asiaticoside in *Standard solution A*. Identify other triterpene derivative peaks in the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used. The *Sample solution* shows additional peaks corresponding to madecassoside and asiaticoside B (these two peaks may co-elute), madecassic acid, terminolic acid, and asiatic acid.

COMPOSITION

• CONTENT OF TRITERPENE DERIVATIVES

Solution A: Dilute 3 mL of phosphoric acid with water to 1000 mL, mix, filter, and degas.

Solution B: Acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	78	22
65	45	55
66	5	95
75	5	95
76	78	22
85	78	22

Standard solution A: 0.1 mg/mL of USP Asiaticoside RS in methanol

Standard solution B: Sonicate a portion of USP Powdered *Centella asiatica* Extract RS in methanol to obtain a solution with a concentration of about 5.0 mg/mL. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Sonicate a portion of Powdered *Centella asiatica* Extract in methanol to obtain a solution with a concentration of about 5.0 mg/mL. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 200 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Flow rate:** 1.0 mL/min**Injection size:** 10 μL**System suitability****Samples:** *Standard solution A* and *Standard solution B***Suitability requirements****Chromatogram similarity:** The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used.**Tailing factor:** Between 0.8 and 2.0 for the asiaticoside peak, *Standard solution A***Resolution:** NLT 1.5 between the madecassic acid and terminolic acid peaks, *Standard solution B***Relative standard deviation:** NMT 2.0% determined from the asiaticoside peak in repeated injections, *Standard solution A***Analysis****Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*. [NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 48 h at room temperature.]Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used, identify the retention times of the peaks corresponding to different triterpene derivatives. The approximate relative retention times of the different triterpene derivatives are provided in the following table.

Analyte	Approximate Relative Retention Time
Madecassoside	0.71
Asiaticoside B	0.72
Asiaticoside	1.00
Madecassic acid	2.40
Terminolic acid	2.44
Asiatic acid	3.12

Separately calculate the percentages of the sum of madecassoside and asiaticoside B (these two peaks may co-elute), asiaticoside, the sum of madecassic acid and terminolic acid, and asiatic acid in the portion of Powdered *Centella asiatica* Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

 r_U = peak response(s) of the triterpene derivative(s) from the *Sample solution* r_S = peak response of asiaticoside from *Standard solution A* C_S = concentration of USP Asiaticoside RS in *Standard solution A* (mg/mL) C_U = concentration of Powdered *Centella asiatica* Extract in the *Sample solution* (mg/mL) F = conversion factors for analytes: 1.00 for asiaticoside, 1.017 for the sum of madecassoside and asiaticoside B, 0.526 for the sum of madecassic acid and terminolic acid, and 0.509 for asiatic acid**Acceptance criteria:** Add the percentages of different triterpene derivatives: NLT 90.0% and NMT 110.0% of the labeled amount of triterpene derivatives; the labeled amount of triterpene derivatives is NMT 40%, calculated on the dried basis.**CONTAMINANTS**

- **HEAVY METALS**, *Method III* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10^4 cfu per g. The total combined yeast and mold count does not exceed 10^3 cfu per g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry 1.0 g of Powdered *Centella asiatica* Extract at 105° for 2 h: it loses NMT 5% of its weight.
- **OTHER REQUIREMENTS**: Meets the requirements of the test for *Residual Solvents* under *Botanical Extracts* <565>

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.
- **LABELING**: The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. It meets other labeling requirements under *Botanical Extracts* <565>.
- **USP REFERENCE STANDARDS** <11>
 - USP Asiaticoside RS
 - USP Powdered *Centella asiatica* Extract RS

Centella asiatica Triterpenes**DEFINITION***Centella asiatica* Triterpenes is a fraction enriched in *Centella asiatica* triterpenes derivatives. It is prepared from *Centella asiatica* Extract using suitable solvents or other means. It contains NLT 90.0% of triterpene derivatives, calculated on the anhydrous basis, as the sum of two or more of the following: madecassoside, asiaticoside B, asiaticoside, madecassic acid, terminolic acid, and asiatic acid.**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
 - Standard solution A:** 0.5 mg/mL of USP Asiaticoside RS in methanol
 - Standard solution B:** 10 mg/mL of USP Powdered *Centella asiatica* Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.
 - Sample solution:** Transfer an amount of *Centella asiatica* Triterpenes, equivalent to about 5 mg of triterpene derivatives, to a centrifuge tube. Add 5 mL of methanol, sonicate for 10 min, centrifuge, and use the supernatant.
 - Adsorbent:** Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates) or with an average particle size of 5 μm (HPTLC plates)
 - Application volume:** 10 μL (TLC plates) or 4 μL (HPTLC plates)
 - Developing solvent system:** A mixture of methylene chloride, methanol, and water (14:6:1)
 - Spray reagent:** A solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh.]

Analysis**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the cham-

ber, dry, spray with *Spray reagent*, heat for 3 min at 120°, and examine under visible light.

Acceptance criteria: The *Sample solution* chromatogram exhibits a violet band in the lower third of the plate due to asiaticoside, corresponding in color and R_f to that in *Standard solution A*. The *Sample solution* shows additional bands corresponding to some or all of the following triterpene derivatives: a violet band due to madecassoside at an R_f lower than that of asiaticoside, a violet band in the upper third of the plate due to asiatic acid, and a violet band due to madecassic acid at an R_f lower than that of asiatic acid. Bands detected in the *Sample solution* correspond in position and color to bands in *Standard solution B*. Other minor bands may be observed in the *Sample solution* and *Standard solution B*.

- **B. HPLC IDENTIFICATION TEST:** The *Sample solution* chromatogram from the test for *Content of Triterpene Derivatives* shows a peak at the retention time corresponding to that of asiaticoside in *Standard solution A*. Identify other triterpene derivative peaks in the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used. The *Sample solution* shows additional peaks corresponding to some or all of the following: madecassoside and asiaticoside B (these two peaks may co-elute), madecassic acid, terminolic acid, and asiatic acid.

COMPOSITION

• CONTENT OF TRITERPENE DERIVATIVES

Solution A: Dilute 3 mL of phosphoric acid with water to 1000 mL, mix, filter, and degas.

Solution B: Acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	78	22
65	45	55
66	5	95
75	5	95
76	78	22
85	78	22

Standard solution A: 0.2 mg/mL of USP Asiaticoside RS in methanol

Standard solution B: Sonicate a portion of USP Powdered *Centella asiatica* Extract RS in methanol to obtain a solution with a concentration of about 5.0 mg/mL. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Sample solution: About 1.0 mg/mL of *Centella asiatica* Triterpenes in methanol; sonicate if necessary. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.0 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used.

Tailing factor: Between 0.8 and 2.0 for the asiaticoside peak, *Standard solution A*

Resolution: NLT 1.5 between the madecassic acid and terminolic acid peaks, *Standard solution B*

Relative standard deviation: NMT 2.0% determined from the asiaticoside peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*. [NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 48 h at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered *Centella asiatica* Extract RS being used, identify the retention times of the peaks corresponding to different triterpene derivatives. The approximate relative retention times of the different triterpene derivatives are provided in the following table.

Analyte	Approximate Relative Retention Time
Madecassoside	0.71
Asiaticoside B	0.72
Asiaticoside	1.00
Madecassic acid	2.40
Terminolic acid	2.44
Asiatic acid	3.12

Separately calculate the percentages of the triterpene derivatives in the portion of *Centella asiatica* Triterpenes taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response(s) of the triterpene derivative(s) from the *Sample solution*

r_S = peak response of asiaticoside from *Standard solution A*

C_S = concentration of USP Asiaticoside RS in *Standard solution A* (mg/mL)

C_U = concentration of *Centella asiatica* Triterpenes in the *Sample solution* (mg/mL)

F = conversion factors for analytes: 1.00 for asiaticoside, 1.017 for madecassoside, 1.017 for asiaticoside B, 0.526 for madecassic acid, 0.526 for terminolic acid, and 0.509 for asiatic acid

Acceptance criteria: Add the percentages of different triterpene derivatives: NLT 90.0% on the anhydrous basis.

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^3 cfu/g. The total combined yeast and mold count does not exceed 10^2 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Escherichia coli*

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 5%
- **OTHER REQUIREMENTS:** Meets the requirements of the test for *Residual Solvents* under *Botanical Extracts* (565)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.

- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.
- **USP REFERENCE STANDARDS** <11>
USP Asiaticoside RS
USP Powdered *Centella asiatica* Extract RS

Chamomile

DEFINITION

Chamomile consists of the dried flower heads of *Matricaria recutita* L. (*Matricaria chamomilla* L., *Matricaria chamomilla* L. var. *courrantiana*, *Chamomilla recutita* L.) Rauschert (Fam. Asteraceae alt. Compositae). It contains NLT 0.4% of blue volatile oil, NLT 0.3% of apigenin-7-glucoside, and NLT 0.15% of bisabolol derivatives, calculated as levomenol.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 1.0 mg/mL of borneol, 2.0 mg/mL of bornyl acetate, and 0.4 mg/mL of guaiazulene in toluene

Sample solution: Reduce 1.0 g of Chamomile to a coarse powder, using a porcelain pestle and mortar. Transfer to a 1.5-cm × 15-cm chromatographic column, and tamp lightly with a short length of rubber hose. Rinse the pestle and mortar twice, each time with 10 mL of methylene chloride. Pour the rinsings into the column. Collect the percolate in a flask with a long, narrow neck, and remove the solvent by evaporation on a water bath. Dissolve the residue in 0.5 mL of toluene.

Adsorbent: 0.25-mm layer of chromatographic silica gel

Developing solvent: Chloroform

Spray reagent: Mix anisaldehyde, glacial acetic acid, and methanol (0.5: 10: 85). Then carefully add 5 mL of sulfuric acid to this solution.

Application volume: 10 µL, as 3-mm × 20-mm bands

Analysis

Samples: *Standard solution* and *Sample solution*
Examine the plate under short-wavelength UV light: the *Sample solution* exhibits a number of quenching areas, the largest of which is due to en-yne-dicycloether and has the same R_f value as the band due to bornyl acetate in the *Standard solution*. There is also a band due to matricin near the line of application. Spray the plate evenly with the *Spray reagent*. Examine the plate in daylight while heating at 100°–105° for 5–10 min. The chromatogram obtained from the *Standard solution* shows in the lower third a brownish yellow zone that becomes violet-gray after a few hours and is due to borneol; in the middle a yellowish brown to gray zone due to bornyl acetate; and in the upper third a deep red zone with a blue edge due to guaiazulene.

Acceptance criteria: The *Sample solution* exhibits a blue zone due to matricin near the starting point; several violet-red zones, one of which is due to bisabolol, at R_f values between those of borneol and bornyl acetate; a brownish zone, due to en-yne-dicycloether, at an R_f value corresponding to that of bornyl acetate; red zones, due to terpenes, at R_f values similar to those of guaiazulene; and other zones that appear in the middle and lower parts of the chromatogram.

• B.

Analysis: Dissolve 0.25 g of dimethylaminobenzaldehyde in a mixture of 5 mL of phosphoric acid, 45 mL of acetic acid, and 45 mL of water. Transfer 2.5 mL of this solution and 0.1 mL of the *Sample solution*, prepared as directed for *Identification* test A, to a test tube. Heat on

a water bath for 2 min, and allow to cool. Add 5 mL of solvent hexane, and shake.

Acceptance criteria: The aqueous layer has a distinct greenish blue or blue color.

COMPOSITION

• CONTENT OF APIGENIN-7-GLUCOSIDE

Dilute phosphoric acid: Mix 5.0 mL of phosphoric acid in 50 mL of water. Dilute with water to 100 mL.

Solution A: 0.005 M solution of monobasic potassium phosphate. Adjust with *Dilute phosphoric acid* to a pH of 2.55 ± 0.05 .

Solution B: Acetonitrile and methanol (13:7)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	74	26
3	74	26
22	15	85
27	74	26
30	74	26

Standard solution: 25.0 µg/mL of USP Apigenin-7-glucoside RS and 10.0 µg/mL of 7-methoxycoumarin in methanol and water (1:1)

Sample solution: Transfer 1.0 g of Chamomile to a suitable flask fitted with a reflux condenser and a stirrer. Add 80.0 mL of methanol, and reflux the mixture with stirring for 1 h. Cool the flask to room temperature, pass the extract through a folded filter paper, and collect the filtrate in a 100-mL volumetric flask. Rinse the flask with 3 mL of methanol, pour the methanolic rinsings through the filter paper, and add the filtrate to the volumetric flask. Dilute with methanol to volume, and mix. Transfer 25.0 mL of the filtered solution to a round-bottom flask fitted with a reflux condenser and a stirrer; add 5.0 mL of sodium hydroxide solution, prepared by dissolving 0.4 g of sodium hydroxide in 5.0 mL of water; and reflux the mixture for 25 min. Cool the flask, and adjust the solution with hydrochloric acid to a pH of 5.0–6.2. Quantitatively transfer the solution to a 50-mL volumetric flask, dilute with methanol to volume, and filter, discarding the first 10 mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 335 nm

Column: 4-mm × 12.5-cm; packing L1

Flow rate: 1 mL/min

[NOTE—Make adjustments, if necessary, to obtain relative retention times of 0.63 for apigenin-7-glucoside and 1.0 for 7-methoxycoumarin.]

Injection size: 15 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for apigenin-7-glucoside, 7-methoxycoumarin, apigenin, *trans*-spiroether, and *cis*-spiroether are about 0.63, 1.0, 1.2, 1.6, and 1.8, respectively.]

Suitability requirements

Resolution: NLT 3.5 between apigenin-7-glucoside and 7-methoxycoumarin

Relative standard deviation: NMT 2.0% for apigenin-7-glucoside

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Allow the *Sample solution* to elute for NLT 6 times the retention time of apigenin-7-glucoside.]

Calculate the percentage of apigenin-7-glucoside in the portion of Chamomile taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

- r_U = peak response of apigenin-7-glucoside from the *Sample solution*
 r_S = peak response of apigenin-7-glucoside from the *Standard solution*
 C_S = concentration of USP Apigenin-7-glucoside RS in the *Standard solution* (mg/mL)
 V = volume of *Sample solution* (mL)
 W = weight of Chamomile taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.3%

• CONTENT OF BISABOLANE DERIVATIVES

Standard solution: 1 mg/mL of USP Levomenol RS in cyclohexane

Sample solution: Transfer the volatile oils obtained in the test for *Articles of Botanical Origin* (561), *Volatile Oil Determination* to a 25-mL volumetric flask, rinse the graduated tube of the apparatus with a small portion of cyclohexane, transfer the rinsing to the 25-mL volumetric flask, add cyclohexane to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary; coated with a 0.25-μm film of phase G16

Temperature

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	4	230	10

Detector: 250°

Injection port: 220°

Carrier gas: Helium

Flow rate: 1.0 mL/min

Injection size: 1 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8 for levomenol

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Identify the peaks due to levomenol, bisabolol oxide B, bisabolol oxide, and bisabolol oxide A in the *Sample solution*, using the retention time of levomenol in the *Standard solution* and the approximate relative retention times of 0.89, 0.97, and 1.1 for bisabolol oxide B, bisabolol oxide, and bisabolol oxide A, respectively, with reference to the levomenol peak.

Calculate the percentage of bisabolane derivatives in the portion of Chamomile taken:

$$\text{Result} = (r_T/r_S) \times C_S \times (V/W) \times 100$$

- r_T = sum of the peak areas for bisabolol oxide B, bisabolol oxide, levomenol, and bisabolol oxide A from the *Sample solution*
 r_S = levomenol peak area from the *Standard solution*
 C_S = concentration of USP Levomenol RS in the *Standard solution* (mg/mL)
 V = volume of *Sample solution* (mL)

W = weight of Chamomile taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.15%

• ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Determination (561)

Analysis: Proceed as directed, except use 60 g of coarsely powdered Chamomile as the test specimen, a 2-L round-bottom flask, 300 mL of water as distillation liquid, and 0.5 mL of xylene in the graduated tube. Distill for 4 h at a rate of 3–4 mL/min.

Acceptance criteria: NLT 0.4% of blue volatile oil is found. [NOTE—Retain the volatile oils for use in the test for *Content of Bisabolane Derivatives*.]

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS (2021):** The total bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacterial count does not exceed 10^3 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

• **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Flower head is hemispherical, about 6 mm in diameter, composed of a few ray florets and numerous disk florets (distinction from *Matricaria discoidea*, which has disk florets only), carried on a receptacle surrounded by an involucre. Involucre is green, formed of two to three rows of lanceolate, glabrous, and imbricated bracts with blunt apices and scarious whitish edges. Ray florets, which usually have fallen off, have 10–20 pistils; corolla is ligulate, white, but darkens at a length of 6 mm and a width of about 2 mm, 3-toothed, and traversed by four main veins. Disk florets are yellow, perfect, about 2 mm in length; corolla is tubular with five teeth; five stamens are epipetalous and syngenesious. Receptacle is hollow (distinction from *Chrysanthemum* and *Anthemis* species), hemispherical in the young and conical in the old flower head, 3–10 mm in width, and lacking paleae. Achene is ovoid, and has three to five longitudinal ribs.

Microscopic: Separate the capitulum into its parts, and examine under a microscope. The outer, abaxial epidermis of the involucre bracts shows a scarious margin with a single layer of radially elongated cells and a central part made up of chlorophyll tissue covered by elongated epidermal cells with sinuous lateral walls, stomata, and secretory trichomes. The vascular bundles are surrounded by numerous elongated, pitted sclereids with fairly large lumens. In surface view, ligulate and tubular corollas show isodiametric or elongated cells with more or less wavy walls and a few glandular trichomes. The outer part of the epidermis of the ligulate florets consists of papillary cells with cuticular striations radiating from their tips. In the mesophyll, very small clusters of calcium oxalate are sometimes seen. Four main veins run lengthwise through the entire mesophyll, sometimes accompanied by one or two other veins, which are shorter and run parallel to the main veins. Each of the two main median veins split into two near the tip and, with the lateral veins, anastomose two by two to form three arcs at the three terminal teeth of the ligule. The ovaries, oval to spherical, of both kinds of florets have at their base a sclerous ring consisting of a single row of cells. The epidermis of the ovary is made up of elongated cells with sinuous walls between which secretory trichomes are situated. The ovaries contain numerous, very small clusters of calcium oxalate. In the tubular florets, the low part of each stamen filament is

surrounded by thick-walled cells. The ends of the two stigmata have papillose epidermal cells. The pollen grains have a diameter of about 30 μm and are rounded and triangular, with three germinal pores and a spiny exine.

- **BROKEN FLOWERS:** NMT 25% passes through a No. 25 standard-mesh sieve (see *Particle Size Distribution Estimation by Analytical Sieving* (786)).
- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 2.0%
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 13.0%, determined on 1.0 g of powdered Chamomile

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article. This article is exempted from the requirements of the *General Notices* with respect to the pregnancy and lactation statement (section 10.40.50. *Labeling Botanical-Containing Products*).
- **USP REFERENCE STANDARDS (11)**
USP Apigenin-7-glucoside RS
USP Levomenol RS

Chaste Tree

DEFINITION

Chaste Tree consists of the dried ripe fruits of *Vitex agnus-castus* L. (Verbenaceae). It contains NLT 0.05% of agnuside and NLT 0.08% of casticin, calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 100 mg of USP Powdered Chaste Tree Extract RS in 1 mL of methanol. Heat in a water bath at 60° for 10 min. Centrifuge, and use the clear supernatant.

Sample solution: Transfer about 1 g of powdered plant material to a screw-capped centrifuge tube. Add 10 mL of methanol, heat in a water bath at 60° for 10–15 min, cool, and filter.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates)

Application volume: 90 μL , *Standard solution*; 60 μL , *Sample solution*; in bands that are 2 cm in length

Developing solvent system: Ethyl acetate, methanol, and water (77:15:8)

Spray reagent: 10 mg/mL of *p*-dimethylaminobenzaldehyde in 1 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*
Develop to a length of NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat for 10 min at 120°.

Acceptance criteria: The *Sample solution* shows the following: a blue zone (at an R_f value of about 0.21) due to the presence of aucubin and that corresponds in color and R_f value to a similar zone for the *Standard solution*; a blue zone (at an R_f value of about 0.44) as a result of the presence of agnuside that corresponds in color and R_f value to a similar zone for the *Standard solution*; and one broad zone, violet in the middle, near the solvent front and that corresponds in color and R_f value to a similar zone for the *Standard solution*. Other colored zones of varying intensities may be observed for the *Sample solution*.

- **B.** In the test for *Content of Casticin*, the chromatogram of the *Sample solution* shows a peak at the retention time

corresponding to the casticin peak in the chromatogram of the *Standard solution*.

COMPOSITION

• CONTENT OF CASTICIN

Standard solution: About 0.05 mg/mL of USP Casticin RS in methanol, with sonication. Pass through a cellulose membrane filter of 0.45- μm or finer pore size.

Sample solution: Place about 1000 mg of ground plant material in a container with a stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at 19,000 rpm for 2 min. Filter each supernatant, and transfer to a 250-mL round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness. Dissolve the residue in methanol, quantitatively transfer to a 20-mL volumetric flask, and dilute with methanol to volume. Pass through a cellulose membrane filter of 0.45- μm or finer pore size.

Solution A: Methanol

Solution B: 5.88 g/L of phosphoric acid in water

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 348 nm

Column: 3.1-mm \times 12.5-cm; 5- μm packing L1

Column temperature: 25°

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the casticin peak

Relative standard deviation: NMT 2.0% for the casticin peak, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of casticin in the portion of Chaste Tree taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of casticin from the *Sample solution*

r_S = peak response of casticin from the *Standard solution*

C_S = concentration of USP Casticin RS in the *Standard solution* (mg/mL)

C_U = concentration of Chaste Tree in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 0.08% of casticin on the dried basis

• CONTENT OF AGNUSIDE

Solvent: Methanol and water (1:19)

Standard solution: Dissolve a quantity of USP Agnuside RS in *Solvent*, with sonication. Dilute with methanol to obtain a concentration of about 0.125 mg/mL. Pass through a cellulose membrane filter of 0.45- μm or finer pore size.

Sample solution: Place about 1000 mg of ground plant material in a container with a stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at 19,000 rpm for 2 min. Centrifuge, and transfer each

supernatant to a 250-mL round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness, and dissolve the residue in 2 mL of *Solvent*. Quantitatively transfer the solution to a solid-phase extraction cartridge packed with neutral aluminum oxide previously conditioned with 5 mL of *Solvent*. Connect the cartridge to a vacuum pressure not exceeding 300 mbar, and collect the eluate. Rinse the round-bottom flask with 2 mL of *Solvent*, pass this solution through the cartridge, apply the vacuum, and collect the eluate. Rinse the cartridge with 4 mL of *Solvent*, and collect the eluate. Combine the eluates from the cartridge, transfer to a 10-mL volumetric flask, and dilute with *Solvent* to volume.

Solution A: Acetonitrile

Solution B: 5.88 g/L of phosphoric acid in water

CONTAMINANTS

- **HEAVY METALS**, *Method III* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements
- **MICROBIAL ENUMERATION TESTS** <2021>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 10⁶ cfu/g, the total combined

molds and yeast count does not exceed 10⁴ cfu/g, and the enterobacterial count does not exceed 10³ cfu/g.

SPECIFIC TESTS

• BOTANICAL CHARACTERISTICS

Macroscopic: Mature chaste tree fruits are spherical to ovoid, 2–4 mm in diameter, very hard, usually with a short pedicel. The fruit is reddish brown to black, slightly rough, and covered with glandular hairs. There are four grooves perpendicular to one another, and a slight depression on the apex, more evident on large fruits. The internal appearance of the fruit is yellowish. The internal structure of the fruit includes four compartments, each containing an oblong seed with a high fat content. A group of up to six spongy, light tan, immature fruits may also accompany mature fruits. The fruit is often covered by a tubular, greenish-gray, fine tomentose calyx, which is persistent and has five teeth.

Microscopic: The exocarp is brown and narrow, consisting of parenchymatous cells with thin walls and partially lignified cells with many pitted thickenings on the inside. In surface view, the exocarp shows an epidermis of polygonal cells with irregular thickenings and glandular hairs, each with a short single-celled stalk and a four-celled head containing essential oil. The outer mesocarp consists of several layers of brown, isodiametric parenchyma cells. The inner mesocarp consists of finely pitted sclerenchymatous cells, some with moderately thickened walls, others consisting of isodiametric stone cells with small lumen. The endocarp consists of a layer of small brown sclereid cells. The seeds are small, having large cotyledons surrounded by thin-walled, large parenchymatous cells that have ribbed thickenings. The nutritive tissue and the cells of the germ contain aleuron grains and oil globules. Starch is absent. The outer epidermis of calyx is composed of polygonal cells, covered by abundant unicellular or multicellular curved trichomes. The inner epidermis of calyx is glabrous and composed of rectangular, elongated cells with slightly wavy walls.

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* <561>: NMT 3.0%
- **LOSS ON DRYING** <731>: Dry 1 g at 105° for 2 h: it loses NMT 10.0%.

- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* <561>: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.
- **USP REFERENCE STANDARDS** <11>
 - USP Agnuside RS
 - USP Casticin RS
 - USP Powdered Chaste Tree Extract RS

Powdered Chaste Tree

DEFINITION

Powdered Chaste Tree is Chaste Tree reduced to a powder or a very fine powder. It contains NLT 0.05% of agnuside and NLT 0.08% of casticin, calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 100 mg of USP Powdered Chaste Tree Extract RS in 1 mL of methanol. Heat in a water

bath at 60° for 10 min. Centrifuge, and use the clear supernatant.

Sample solution: Transfer about 1 g of Powdered Chaste Tree to a screw-capped centrifuge tube. Add 10 mL of methanol, heat in a water bath at 60° for 10–15 min, cool, and filter.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates)

Application volume: 90 µL, *Standard solution*; 60 µL, *Sample solution*; in bands that are 2 cm in length

Developing solvent system: Ethyl acetate, methanol, and water (77:15:8)

Spray reagent: 10 mg/mL of *p*-dimethylaminobenzaldehyde in 1 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*
Develop to a length of NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat for 10 min at 120°.

Acceptance criteria: The *Sample solution* shows the following: a blue zone (at an R_f value of about 0.21) due to the presence of aucubin and that corresponds in color and R_f value to a similar zone for the *Standard solution*; a blue zone (at an R_f value of about 0.44) as a result of the presence of agnuside that corresponds in color and R_f value to a similar zone for the *Standard solution*; and one broad zone, violet in the middle, near the solvent front and that corresponds in color and R_f value to a similar zone for the *Standard solution*. Other colored zones of varying intensities may be observed for the *Sample solution*.

- **B.** In the test for *Content of Casticin*, the chromatogram of the *Sample solution* shows a peak at the retention time corresponding to the casticin peak in the chromatogram of the *Standard solution*.

COMPOSITION

• CONTENT OF CASTICIN

Standard solution: About 0.05 mg/mL of USP Casticin RS in methanol, with sonication. Pass through a cellulose membrane filter of 0.45-µm or finer pore size.

Sample solution: Place about 1000 mg of Powdered Chaste Tree in a container with a stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at 19,000 rpm for 2 min. Filter each supernatant, and transfer to a 250-mL round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness. Dissolve the residue in methanol, quantitatively transfer to a 20-mL volumetric flask, and dilute with methanol to volume. Pass through a cellulose membrane filter of 0.45-µm or finer pore size.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.
- **USP REFERENCE STANDARDS** <11>
 - USP Agnuside RS
 - USP Casticin RS
 - USP Powdered Chaste Tree Extract RS

Powdered Chaste Tree Extract**DEFINITION**

Powdered Chaste Tree Extract is prepared from Chaste Tree by extraction with hydroalcoholic mixtures or other suitable solvents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of casticin and agnuside, calculated on the dried basis. It may contain suitable added substances.

IDENTIFICATION• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 100 mg of USP Powdered Chaste Tree Extract RS in 1 mL of methanol. Heat in a water bath at 60° for 10 min. Centrifuge, and use the clear supernatant.

Sample solution: Shake a quantity of Extract, equivalent to about 10 mg of the labeled amount of agnuside, in 10 mL of methanol. Heat in a water bath at 60°. Centrifuge or filter before use.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates)

Application volume: 90 μL, *Standard solution*; 60 μL, *Sample solution*; in bands that are 2 cm in length

Developing solvent system: Ethyl acetate, methanol, and water (77:15:8)

Spray reagent: 10 mg/mL of *p*-dimethylaminobenzaldehyde in 1 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatograms to a length of NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat for 10 min at 120°.

Acceptance criteria: The *Sample solution* shows the following: a blue zone (at an R_f value of about 0.21) due to the presence of aucubin and that corresponds in color and R_f value to a similar zone for the *Standard solution*; a blue zone (at an R_f value of about 0.44) as a result of the presence of agnuside that corresponds in color and R_f value to a similar zone for the *Standard solution*; and one broad zone, violet in the middle, near the solvent front and that corresponds in color and R_f value to a similar zone for the *Standard solution*. Other colored zones of varying intensities may be observed in the *Sample solution*.

- **B.** In the test for *Content of Casticin*, the chromatogram of the *Sample solution* exhibits a peak at the retention time corresponding to casticin.
- **C.** In the test for *Content of Agnuside*, the chromatogram of the *Sample solution* exhibits a peak at the retention time corresponding to agnuside.

COMPOSITION• **CONTENT OF CASTICIN**

Standard solution: About 0.05 mg/mL of USP Casticin RS in methanol, with sonication. Pass through a cellulose membrane filter of 0.45-μm or finer pore size.

Sample solution: Transfer a quantity of Extract, equivalent to about 2.5 mg of the labeled content of casticin, into a 50-mL volumetric flask. Add 25 mL of methanol, and sonicate in a bath at 40° for 10 min, shaking to disperse the solid. Cool to room temperature, and dilute with methanol to volume. Centrifuge or pass through a filter of 0.45-μm or finer pore size.

Solution A: Methanol
Solution B: 5.88 g/L of phosphoric acid in water
Mobile phase: See Table 1.

Choline Bitartrate

C₉H₁₉NO₇ 253.25
2-Hydroxyethanaminium, -N,N,N-trimethyl-, [R-(R*,R*)]-2,3-dihydroxybutanedioate (1:1);
(2-Hydroxyethyl)trimethylammonium-L-(+)-tartrate salt (1:1) [87-67-2].

DEFINITION

Choline Bitartrate contains NLT 99.0% and NMT 100.5% of choline bitartrate (C₉H₁₉NO₇), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

• **B.**

Sample: 1 g

Analysis: Dissolve the *Sample* in 20 mL of water, and add 2 mL of potassium chloride solution (1 in 4).

Acceptance criteria: A white precipitate of potassium bitartrate is formed.

ASSAY

- **PROCEDURE**

Sample: 200 mg

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Blank: 50 mL of glacial acetic acid

Analysis: Dissolve the *Sample* in 50 mL of glacial acetic acid and titrate with *Titrant*.

Calculate the percentage of choline bitartrate (C₉H₁₉NO₇) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = *Sample* titrant volume (mL)

B = *Blank* titrant volume (mL)

N = titrant normality (mEq/mL)

F = equivalency factor, 253.2 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES

- **RESIDUAL SOLVENTS** <467>: Meet the requirements, except that the limit for 1,4-dioxane is 10 µg/g

- **RESIDUE ON IGNITION** <281>: NMT 0.1%

- **ARSENIC, Method I** <211>

Analysis: Add 30 mL of water and 5 mL of hydrochloric acid to dissolve the sample.

Acceptance criteria: NMT 2 ppm

- **LEAD** <251>

[NOTE—Use methylene chloride in place of chloroform to prepare the *Dithizone Extraction Solution* and *Standard Dithizone Solution*.]

Solution A: Transfer 8.4 g of sodium hydroxide solution (1 in 2) to a plastic bottle, add 100 mL of ammonium hydroxide, and mix.

Standard solution: Transfer 1.0 mL of the *Diluted Standard Lead Solution* to a separatory funnel containing 25.0 mL of water.

Sample solution: Dissolve 3.00 g of Choline Bitartrate in a separatory funnel containing 25.0 mL of water.

Analysis

Samples: *Standard solution* and *Sample solution*
Separately add 6.0 mL of *Ammonium Citrate Solution* and 3.0 mL of *Potassium Cyanide Solution* to the *Standard solution* and the *Sample solution*. Extract each of the resulting solutions three times with 5.0-mL portions of *Dithizone Extraction Solution*, shaking for 60 s and draining off each extract into another separator. Shake the combined dithizone solutions for 30 s with 20.0 mL of nitric acid (1 in 100), and discard the methylene chloride layer. Add 6.0 mL of *Ammonia-Cyanide Solution*, 2 mL of *Solution A*, and 10 mL of *Standard Dithizone Solution*, and shake for 45 s. Allow the phases to separate, and measure the absorbance of the lower layer at 510 nm with a suitable spectrophotometer.

Acceptance criteria: The absorbance of the *Sample solution* is NMT the absorbance of the *Standard solution* (NMT 0.3 ppm).

- **HEAVY METALS, Method II** <231>: NMT 10 ppm

- **LIMIT OF TOTAL AMINES**

Standard solution: 500 µg/mL of trimethylamine hydrochloride

Sample solution: Transfer 10.0 g of Choline Bitartrate to a beaker containing a plastic-coated stirring bar, add 70 mL of sodium hydroxide TS and 130 mL of water, and stir until dissolved.

System suitability stock solution: 10 µg/mL of trimethylamine hydrochloride

System suitability solution: Transfer 10.0 mL of *System suitability stock solution* containing a plastic-coated stirring bar, add 160 mL water and 30.0 mL sodium hydroxide TS, and stir until dissolved.

Electrode system: Use a gas-sensing, ammonia-specific indicating electrode with internal reference connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.1 mV (see *pH* <791>).

Standard response line: Mix 30.0 mL of sodium hydroxide TS and 170 mL of water. Add a plastic-coated stirring bar, insert the electrode into the solution, and record the potential, in mV. Continue stirring, and at 5-min intervals, add 0.200, 0.600, 1.00, and 2.00 mL of *Standard solution*, and record the potential after each addition. Plot the logarithms of the cumulative trimethylamine hydrochloride concentrations (0.50, 1.50, 2.50, and 5.00 µg/mL) versus potential, in mV, and determine the slope (S) of the *Standard response line* for the electrode.

System suitability

Sample: *System suitability solution*

Proceed as directed in *Analysis*, except to replace the *Sample solution* with the *System suitability solution* and

in the formula below to replace *W* with *V*, which equals 10 mL.

Suitability requirements: The total change is NLT 10 mV for a 0.4-mL cumulative addition of the *Standard solution*; the amount of trimethylamine hydrochloride found is 8.5–11.5 µg/L.

Analysis

Samples: *Standard solution* and *Sample solution*

Rinse the electrode, insert it into the *Sample solution*, stir, and record the potential, in mV. Add 0.100 mL of the *Standard solution*, and record the potential. Add another 0.100 mL of the *Standard solution*, and record the potential. [NOTE—If the total change after the second addition of the *Standard solution* is less than 10 mV, add a third aliquot of 0.200 mL.]

Calculate the content, in µg/g, of total amines as trimethylamine hydrochloride in the portion of sample taken:

$$\text{Result} = (C_S \times V_A) / [(F - 1) \times W]$$

C_S = concentration of the *Standard solution* (µg/mL)

V_A = total volume of the *Standard solution* added to the *Sample solution* (mL)

W = weight of Choline Bitartrate taken to prepare the *Sample solution* (g)

F = correction factor, calculated by the formula:

$$F = \text{antilog} [(mV_F - mV_0) / S]$$

mV_F = final reading after the additions of the *Standard solution* (mV)

mV₀ = initial reading of the *Sample solution* (mV)

S = slope of the *Standard response line* for the electrode

Acceptance criteria: NMT 10 µg/g

• CHROMATOGRAPHIC PURITY

Buffer solution: 7.1 g/L of anhydrous dibasic sodium phosphate. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: *Buffer solution* and acetonitrile (7:3)

Standard solution: Transfer an amount, NMT 100 mg, of USP Choline Chloride RS to a 24-mL screw-capped vial, and add 400 mg of 3,5-dinitrobenzoyl chloride and 10 mL of acetonitrile. Cap the vial, heat to 55°, and continue heating for 2 h. Cool to room temperature, and add 5 mL of water. Allow to stand for 5 min. Quantitatively transfer the solution to a 25-mL volumetric flask and dilute with acetonitrile to volume. Dilute a volume of this solution with *Mobile phase* to obtain a concentration of 2.0 µg/mL of USP Choline Chloride RS.

Sample solution: Transfer 500 mg of Choline Bitartrate to a centrifuge tube, add 2.0 mL of water, and swirl to dissolve. Add 0.5 mL of potassium chloride solution (7.5 in 25), centrifuge, and transfer 1.0 mL of the supernatant to a 24-mL screw-capped vial. Dry at 120° for 2 h. Add 400 mg of 3,5-dinitrobenzoyl chloride and 10 mL of acetonitrile. Cap the vial, and heat at 55° for 2 h. Cool to room temperature, add 5 mL of water, and allow to stand for 5 min. Quantitatively transfer this solution to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Pipet 2.0 mL of the solution to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 208 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor (*k'*): NLT 2

Relative standard deviation: NMT 5%, determined from the choline derivative peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Choline Bitartrate taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times (M_{r1} / M_{r2}) \times 100$$

r_U = peak response for each impurity, excluding that for the choline derivative and 3,5-dinitrobenzoic acid from the *Sample solution*

r_S = peak response for the choline derivative from the *Standard solution*

C_S = concentration of USP Choline Chloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Choline Bitartrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of choline bitartrate, 253.25

M_{r2} = molecular weight of choline chloride, 139.62

Acceptance criteria

Individual impurities: NMT 0.3%

Total impurity: NMT 2.0%

SPECIFIC TESTS

• OPTICAL ROTATION, *Specific Rotation* <781S>

Sample solution: 400 mg/mL in water

Acceptance criteria: +17.5° to +18.5°

• PH <791>: 3.0–4.0, in a solution (1 in 10)

• WATER DETERMINATION, *Method I* <921>: NMT 0.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

• USP REFERENCE STANDARDS <11>

USP Choline Bitartrate RS

USP Choline Chloride RS

Choline Chloride

C₅H₁₄ClNO 139.62
(2-Hydroxyethyl)trimethylammonium chloride;
2-Hydroxy-*N,N,N*-trimethylethanaminium chloride [67-48-1].

DEFINITION

Choline Chloride contains NLT 99.0% and NMT 100.5% of choline chloride (C₅H₁₄ClNO), calculated on the anhydrous basis.

IDENTIFICATION

• A. INFRARED ABSORPTION <197K>

• B. IDENTIFICATION TESTS—GENERAL, *Chloride* <191>: A solution (1 in 20) meets the requirements.

ASSAY

• PROCEDURE

Sample: 120 mg

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Potentiometric

Blank: 35 mL of water. Add 3 drops of acetic acid.

Analysis: Dissolve the *Sample* in 35 mL of water and add 3 drops of acetic acid. Titrate with *Titrant*.

Calculate the percentage of choline chloride ($C_5H_{14}ClNO$) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = *Sample* titrant volume (mL)

B = *Blank* titrant volume (mL)

N = titrant normality (mEq/mL)

F = equivalency factor, 139.6 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES

- **RESIDUAL SOLVENTS** (467): Meets the requirements, except that the limit for 1,4-dioxane is 10 µg/g

- **RESIDUE ON IGNITION** (281): NMT 0.05%

- **ARSENIC, Method I** (211)

Analysis: Add 30 mL of water and 5 mL of hydrochloric acid to dissolve the sample.

Acceptance criteria: NMT 2 ppm

- **LEAD** (251)

[NOTE—Use methylene chloride in place of chloroform to prepare the *Dithizone Extraction Solution* and *Standard Dithizone Solution*.]

Solution A: Transfer 8.4 g of sodium hydroxide solution (1 in 2) to a plastic bottle, add 100 mL of ammonium hydroxide, and mix.

Standard solution: Transfer 1.0 mL of the *Diluted Standard Lead Solution* to a separatory funnel containing 25.0 mL of water.

Sample solution: Dissolve 3.00 g of Choline Chloride in a separatory funnel containing 25.0 mL of water.

Analysis

Samples: *Standard solution* and *Sample solution*
Separately add 6.0 mL of *Ammonium Citrate Solution* and 3.0 mL of *Potassium Cyanide Solution* to the *Standard solution* and the *Sample solution*. Extract each of the resulting solutions three times with 5.0-mL portions of *Dithizone Extraction Solution*, shaking for 60 s and draining off each extract into another separator. Shake the combined dithizone solutions for 30 s with 20.0 mL of nitric acid (1 in 100), and discard the methylene chloride layer. Add 6.0 mL of *Ammonia–Cyanide Solution*, 2 mL of *Solution A*, and 10 mL of *Standard Dithizone Solution*, and shake for 45 s. Allow the phases to separate, and measure the absorbance of the lower layer at 510 nm with a suitable spectrophotometer.

Acceptance criteria: The absorbance of the *Sample solution* is NMT the absorbance of the *Standard solution* (NMT 0.3 ppm).

- **HEAVY METALS, Method II** (231): NMT 10 ppm

- **LIMIT OF TOTAL AMINES**

Standard solution: 500 µg/mL of trimethylamine hydrochloride in water

Sample solution: Transfer 10.0 g of Choline Chloride to a beaker containing a plastic-coated stirring bar, add 170 mL of water and 30.0 mL of sodium hydroxide TS, and stir until dissolved.

System suitability stock solution: 10 µg/mL of trimethylamine hydrochloride in water

System suitability solution: Transfer 10.0 mL of *System suitability stock solution* to a beaker containing a plastic-coated stirring bar, add 160 mL of water and 30.0 mL of sodium hydroxide TS, and stir until dissolved.

Electrode system: Use a gas-sensing, ammonia-specific indicating electrode with internal reference connected

to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.1 mV (see *pH* (791)).

Standard response line: Mix 30.0 mL of sodium hydroxide TS, and 170 mL of water. Add a plastic-coated stirring bar, insert the electrode into the solution, and record the potential, in mV. Continue stirring, and at 5-min intervals add 0.200, 0.600, 1.00, and 2.00 mL of *Standard solution*, and record the potential after each addition. Plot the logarithms of the cumulative trimethylamine hydrochloride concentrations (0.50, 1.50, 2.50, and 5.00 µg/mL) versus potential, in mV, and determine the slope (*S*) of the *Standard response line* for the electrode.

System suitability

Sample: *System suitability solution*

Proceed as directed in *Analysis*, except to replace the *Sample solution* with the *System suitability solution* and in the formula below to replace *W* with *V*, which equals 10 mL.

USP Choline Chloride RS

Chondroitin Sulfate Sodium

Chondroitin, hydrogen sulfate, sodium salt [9082-07-9].

DEFINITION

Chondroitin Sulfate Sodium is the sodium salt of the sulfated linear glycosaminoglycan obtained from bovine, porcine, or avian cartilages of healthy and domestic animals used for food by humans. Chondroitin Sulfate Sodium consists mostly of the sodium salt of the sulfate ester of *N*-acetylchondrosamine (2-acetamido-2-deoxy-β-D-galactopyranose) and D-glucuronic acid copolymer. These hexoses are alternately linked β-1,4 and β-1,3 in the polymer. Chondrosamine moieties in the prevalent glycosaminoglycan are monosulfated primarily on position 4 and less so on position 6. It contains NLT 90.0% and NMT 105.0% of chondroitin sulfate sodium, calculated on the dried basis.

[NOTE—Chondroitin Sulfate Sodium is extremely hygroscopic once dried. Avoid exposure to the atmosphere, and weigh promptly.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. IDENTIFICATION TESTS—GENERAL**, *Sodium* <191>: Meets the requirements

Sample solution: 0.5 g in 10 mL of water

COMPOSITION

• CONTENT OF CHONDROITIN SULFATE SODIUM

Standard solutions: 1.5, 1.0, and 0.5 mg/mL of USP Chondroitin Sulfate Sodium RS in water

Sample solution: Transfer 100 mg of dried Chondroitin Sulfate Sodium into a 100-mL volumetric flask, dissolve in 30 mL of water, and dilute with water to volume.

Diluent: Weigh about 297 mg of monobasic potassium phosphate, 492 mg of dibasic potassium phosphate, and 250 mg of polysorbate 80, and transfer into a 1-L beaker. Dissolve in 900 mL of water, and adjust with potassium hydroxide or phosphoric acid to a pH of 7.0 ± 0.2. Dilute with water to 1 L, and mix thoroughly.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Photometric titration

Titrant: 1 mg/mL of cetylpyridinium chloride in water. Degas before use.

Endpoint detection: Turbidimetric with a photoelectric probe

Analysis: Transfer 5.0 mL of each *Standard solution* and the *Sample solution* to separate titration vessels, and add 25 mL of *Diluent* to each. Stir until a steady reading is obtained with a phototrode either at 420, 550, or 660 nm. Set the instrument to zero in absorbance mode. Titrate with *Titrant* using the phototrode to determine the endpoint turbidimetrically. From a linear regression equation, calculated using the volumes of *Titrant* consumed versus concentrations of the *Standard solutions*, determine the concentration of chondroitin sulfate sodium in the *Sample solution*.

Calculate the percentage of chondroitin sulfate sodium in the portion Chondroitin Sulfate Sodium taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of chondroitin sulfate sodium in the aliquot of the *Sample solution*, obtained from the regression equation (mg/mL)

C_U = concentration of Chondroitin Sulfate Sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–105.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: 20.0%–30.0% on the dried basis
- **CHLORIDE AND SULFATE**, *Chloride* <221>: NMT 0.50%; a 0.10-g portion shows no more chloride than corresponds to 0.7 mL of 0.020 N hydrochloric acid.
- **CHLORIDE AND SULFATE**, *Sulfate* <221>

Sample solution: Dissolve 200 mg in 40 mL of water.

Add 10 mL of a solution of cetylpyridinium chloride having a concentration of 30 mg/mL, and pass through a filter. Use a 25-mL portion of the filtrate.

Acceptance criteria: NMT 0.24%; the *Sample solution* shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid.

• ELECTROPHORETIC PURITY

(See *Electrophoresis* <726>.)

Barium acetate buffer: Dissolve 25.24 g of barium acetate in 900 mL of water. Adjust with acetic acid to a pH of 5.0, and dilute with water to 1000 mL.

Staining reagent: Dissolve 1 g of toluidine blue in 1000 mL of 0.1 M acetic acid.

Standard solution A: 30 mg/mL of USP Chondroitin Sulfate Sodium RS in water

Standard solution B: Dilute 1 mL of *Standard solution A* with water to 50 mL.

Sample solution: 30 mg/mL of Chondroitin Sulfate Sodium in water

Analysis: Fill the chambers of an electrophoresis apparatus suitable for separations on cellulose acetate

membranes¹ (a small submarine gel chamber or one dedicated to membrane media) with *Barium acetate buffer*. Soak a cellulose acetate membrane, 5–6 cm × 12–14 cm, in *Barium acetate buffer* for 10 min, or until evenly wetted, then blot dry between two sheets of absorbent paper. Using an applicator² suitable for electrophoresis, apply equal volumes (0.5 µL) of the *Sample solution*, *Standard solution A*, and *Standard solution B* to the brighter side of the membrane held in position in an appropriate applicator stand or on a separating bridge in the chamber. Ensure that both ends of the membrane are dipped at least 0.5–1.0 cm deep into the buffer chambers. Apply a constant 60 volts (6 mA at the start) for 2 h. [NOTE—Perform the application of solutions and voltage within 5 min because further drying of the blotted paper reduces sensitivity.]

Place the membrane in a plastic staining tray, and with the application side down, float or gently immerse in *Staining reagent* for 5 min. Then stir the solution gently for 1 min. Remove the membrane, and destain in 5% acetic acid until the background clears. Compare the bands.

[NOTE—Document the results by taking a picture within 15 min of completion of destaining.]

Acceptance criteria: The electropherogram from the *Sample solution* exhibits a major band that is identical in position to the band from *Standard solution A*. The band from *Standard solution B* is clearly visible at a mobility similar to the band from *Standard solution A*. Any secondary band in the electropherogram of the *Sample solution* is not more intense than the band from *Standard solution B*. NMT 2% of any individual impurity is found. [NOTE—Document the results by taking a picture within 15 min of completion of destaining.]

• LIMIT OF PROTEIN

Solution A: 20 mg/mL of sodium tartrate dihydrate

Solution B: 10 mg/mL of cupric sulfate

Solution C: 20 mg/mL of anhydrous sodium carbonate in 0.1 M sodium hydroxide

Dilute Folin-Ciocalteu reagent: Dilute Folin-Ciocalteu phenol TS with water (1:5). Prepare immediately before use.

Alkaline cupric tartaric reagent: Mix 1 mL each of *Solution A* and *Solution B*, and to the mixture slowly add 100 mL of *Solution C* with stirring. Use within 24 h, and discard afterward.

Standard solution: 36 µg/mL of bovine serum albumin certified standard in water

Sample solution: Transfer a portion of Chondroitin Sulfate Sodium, equivalent to 60 mg of the dried substance, to a 100-mL volumetric flask, and dissolve in and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 750 nm

Blank: Water

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*. Add 2.0 mL of freshly prepared *Alkaline cupric tartaric reagent* to test tubes containing 2.0 mL of the *Standard solution*, 2.0 mL of the *Sample solution*, or 2.0 mL of the *Blank*. After 10 min, add 1.0 mL of *Dilute Folin-Ciocalteu reagent* to each test tube, and mix immediately and vigorously. After 30 min, measure the absorbance of the *Standard solution* and *Sample solution* against the *Blank*.

Acceptance criteria: NMT 6.0% on the dried basis; the absorbance of the *Sample solution* is NMT the absorbance of the *Standard solution*.

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** <2021>: The total bacterial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g.
- **MICROBIAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species, and *Escherichia coli*.
- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

SPECIFIC TESTS

• CLARITY AND COLOR OF SOLUTION

Sample solution: Transfer 2.5 g of Chondroitin Sulfate Sodium to a 50-mL volumetric flask. Dissolve in and dilute with carbon dioxide-free water to volume, and examine immediately.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 420 nm

Cell: 1 cm

Blank: Carbon dioxide-free water

Analysis: Measure the absorbance of the *Sample solution*.

Acceptance criteria: Its absorbance is NMT 0.35.

- **OPTICAL ROTATION**, *Specific Rotation* <781S>: −20.0° to −30.0°

Sample solution: 30 mg/mL

- **PH** <791>: 5.5–7.5, in a solution (1 in 100)

- **LOSS ON DRYING** <731>: Dry a sample at 105° for 4 h: it loses NMT 10.0% of its weight. [NOTE—Chondroitin Sulfate Sodium is extremely hygroscopic once dried. Avoid exposure to the atmosphere, and weigh promptly.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to state the source(s) from which the article was derived, whether bovine, porcine, avian, or a mixture of any of them.
- **USP REFERENCE STANDARDS** <11>
USP Chondroitin Sulfate Sodium RS

Chondroitin Sulfate Sodium Tablets

DEFINITION

Chondroitin Sulfate Sodium Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of chondroitin sulfate sodium.

[NOTE—Chondroitin Sulfate Sodium is extremely hygroscopic once dried. Avoid exposure to the atmosphere, and weigh promptly.]

IDENTIFICATION

• A. ELECTROPHORESIS <726>

Barium acetate buffer: Dissolve 25.24 g of barium acetate in 900 mL of water. Adjust with acetic acid to a pH of 5.0, and dilute with water to 1000 mL.

Staining reagent: 0.1% (w/v) toluidine blue in 0.1 M acetic acid

Standard solution: Use the *Standard solution* of middle concentration from the *Content of Chondroitin Sulfate Sodium*.

Sample solution: Prepare as directed in the *Content of Chondroitin Sulfate Sodium*.

Analysis: Fill the chambers of an electrophoresis apparatus suitable for separations on cellulose acetate mem-

¹ Suitable cellulose acetate membranes for electrophoresis are available from Malta Chemetron SRL, Milano, Italy (www.maltachemetron.com); Fluka Chemical Corp., Milwaukee, WI; and DiaSys Corp., Waterbury, CT (www.diasys.com).

² Suitable applicators are available from DiaSys Corp., Waterbury, CT (www.diasys.com) and Helena Laboratories, Beaumont, TX (www.helena.com).

branes¹ (a small submarine gel chamber or one dedicated to membrane media) with *Barium acetate buffer*. Soak a cellulose acetate membrane 5–6 cm × 12–14 cm in *Barium acetate buffer* for 10 min, or until evenly wetted, then blot dry between two sheets of absorbent paper. Using an applicator² suitable for electrophoresis, apply equal volumes (0.5 µL) of the *Sample solution* and *Standard solution* to the brighter side of the membrane held in position in an appropriate applicator stand or on a separating bridge in the chamber. Ensure that both ends of the membrane are dipped at least 0.5–1.0-cm deep into the buffer chambers. Apply a constant 60 volts (6 mA at the start) for 2 h. [NOTE—Perform the application of solutions and voltage within 5 min because further drying of the blotted paper reduces sensitivity.]

Place the membrane in a plastic staining tray, and with the application side down, float or gently immerse in *Staining reagent* for 5 min. Then stir the solution gently for 1 min. Remove the membrane, and destain in 5% acetic acid until the background clears.

Acceptance criteria: The principal spot from the *Sample solution* has the same migration as the principal spot from the *Standard solution*. [NOTE—Document the results by taking a picture within 15 min of completion of destaining.]

STRENGTH

• CONTENT OF CHONDROITIN SULFATE SODIUM

Standard solutions: 1.5, 1.0, and 0.5 mg/mL of USP Chondroitin Sulfate Sodium RS in water

Sample solution: Transfer an equivalent to 100 mg of chondroitin sulfate sodium from NLT 20 Tablets, finely powdered, to 60 mL of water, and shake to suspend the powder in solution. Sonicate in a 65° water bath for 20 min. Remove from the bath, stir or shake for 5 min, dilute with water to 100 mL, and centrifuge or pass through a suitable filter.

Diluent: Weigh about 297 mg of monobasic potassium phosphate, 492 mg of dibasic potassium phosphate, and 250 mg of polysorbate 80, and transfer into a 1-L beaker. Dissolve in approximately 900 mL of water, and adjust with potassium hydroxide or phosphoric acid to a pH of 7.0 ± 0.2. Dilute with water to 1 L, and mix thoroughly.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Photometric titration

Titrant: 1 mg/mL of cetylpyridinium chloride in water

Endpoint detection: Turbidimetric with photoelectric probe

Analysis: Transfer 5.0 mL of each *Standard solution* and the *Sample solution* to separate titration vessels, and add 25 mL of *Diluent* to each. Stir until a steady reading is obtained with a photoelectric probe either at 420, 550, or 660 nm. Set the instrument to zero in absorbance mode. Titrate with *Titrant* using the photoelectric probe to determine the endpoint turbidimetrically. From a linear regression equation, calculated using the volumes of *Titrant* consumed versus concentrations of the *Standard solutions*, determine the concentration of chondroitin sulfate sodium in the *Sample solution*.

Calculate the percentage of the labeled amount of chondroitin sulfate sodium in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

C_U = nominal concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–120.0% of the label claim

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS

<2040>: Meet the requirements for *Dissolution*

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Titrant and Diluent: Prepare as directed as in *Content of Chondroitin Sulfate Sodium*.

Standard solutions: 1.5, 1.0, and 0.5 mg/mL of USP Chondroitin Sulfate Sodium RS in water

Sample solution: Combine equal portions of the solutions withdrawn from 6 dissolution vessels and pass through a suitable filter; use the pooled sample as the test specimen.

Analysis: Transfer 5.0 mL of each *Standard solution*, and an aliquot of the *Sample solution* equivalent to about 5 mg of chondroitin sulfate sodium, to separate titration vessels. Add 25 mL of *Diluent* to each titration vessel. Stir until a steady reading is obtained with a photoelectric probe. Set the instrument to zero in absorbance mode. Titrate with *Titrant* using the photoelectric probe to determine the endpoint turbidimetrically, either at 420, 550, or 660 nm. From a linear regression equation, calculated using the volumes of *Titrant* consumed versus amount, in mg, of chondroitin sulfate sodium from each *Standard solution*, determine the amount, in mg, of chondroitin sulfate sodium in the aliquot of *Sample solution* taken. Calculate the percentage of the labeled amount of chondroitin sulfate sodium dissolved:

$$\text{Result} = (Ws/a) \times (V/L) \times 100$$

Ws = amount of chondroitin sulfate sodium in the aliquot of the *Sample solution* taken (mg)

a = volume of the aliquot of *Sample solution* taken

V = volume of *Medium*, 900 mL

L = label claim of chondroitin sulfate sodium (mg/Tablet)

Tolerances: NLT 75% of the labeled amount of chondroitin sulfate sodium is dissolved.

• WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

• **LABELING:** Label it to indicate the species of the source from which the chondroitin used to prepare the Tablets was derived. Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.

• USP REFERENCE STANDARDS <11>

² Suitable applicators are available from DiaSys Corp., Waterbury, CT (www.diasys.com) and Helena Laboratories, Beaumont, TX (www.helena.com).

Chromium Picolinate

$C_{18}H_{12}N_3O_6Cr$ 418.30
Chromium Tripicolinate [14639-25-9].

DEFINITION

Chromium Picolinate contains NLT 98.0% and NMT 102.0% of chromium picolinate ($C_{18}H_{12}N_3O_6Cr$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION <197M>

• B.

Sample solution: 4 mg/mL

Analysis: To 5 mL of the *Sample solution* add 1 mL of 5 N sodium hydroxide and 10 drops of 30% hydrogen peroxide, and heat gently for 2 min.

Acceptance criteria: A yellow color develops.

ASSAY

• PROCEDURE

Standard stock solution: 100 µg/mL of chromium. Transfer 0.283 g of potassium dichromate, previously dried at 120° for 4 h, to a 1000-mL volumetric flask, and dilute with water to volume. Store in a polyethylene bottle.

Standard solutions: 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium. Separately transfer 1.0 and 2.0 mL of the *Standard stock solution* to 100-mL volumetric flasks, and transfer 1.5 and 2.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Add 1.0 mL of nitric acid to each flask, and dilute the contents of each flask with water to volume.

Sample solution: Transfer 200 mg of Chromium Picolinate to a 100-mL beaker, and add 25 mL of water. Slowly add 10 mL of nitric acid, and boil for 10 min with constant swirling. Cool the solution, quantitatively transfer to a 500-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, and transfer 5.0 mL of the filtrate to a 100-mL volumetric flask. Add 1 mL of nitric acid, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 357.9 nm

Lamp: Chromium hollow-cathode

Flame: Air-acetylene

Blank: Diluted nitric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* versus the chromium concentration, in µg/mL, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the chromium concentration, in µg/mL, in the *Sample solution*.

Calculate the percentage of chromium picolinate ($C_{18}H_{12}N_3O_6Cr$) in the portion of Chromium Picolinate taken:

$$\text{Result} = (C_{Cr}/C_U) \times (M_r/A_r) \times 100$$

C_{Cr} = concentration of chromium in the *Sample solution*, obtained from the graph (µg/mL)

C_U = concentration of Chromium Picolinate in the *Sample solution* (µg/mL)

M_r = molecular weight of chromium picolinate, 418.31

A_r = atomic weight of chromium, 51.996

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• CHLORIDE AND SULFATE, Chloride <221>

Sample solution: Dissolve 30 mg of Chromium Picolinate in 30–40 mL of water, and heat to 70°. Cool overnight, and filter to remove the precipitate.

Analysis: Add 1 mL each of nitric acid and silver nitrate TS, and add sufficient water to make 50 mL. Mix, and allow to stand for 5 min, protected from direct sunlight.

Acceptance criteria: Any turbidity formed is NMT that produced in a similarly treated control solution containing 0.25 mL of 0.002 N hydrochloric acid (NMT 0.06%).

• CHLORIDE AND SULFATE, Sulfate <221>

Sample solution: Dissolve 100 mg of Chromium Picolinate in 30–40 mL of water, and heat to 90°. Cool overnight, and filter to remove the precipitate.

Analysis: Add 1 mL of 3 N hydrochloric acid, 3 mL of barium chloride TS, and sufficient water to make 50 mL. Mix, and allow to stand for 10 min.

Acceptance criteria: Any turbidity formed is NMT that produced in a similarly treated control solution containing 0.2 mL of 0.02 N sulfuric acid (NMT 0.2%).

SPECIFIC TESTS

• **LOSS ON DRYING** <731>: Dry a sample at 105° for 4 h: it loses NMT 4.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** <11>
USP Chromium Picolinate RS

Chromium Picolinate Tablets

DEFINITION

Chromium Picolinate Tablets contain NLT 95.0% and NMT 125.0% of the labeled amount of chromium (Cr).

IDENTIFICATION

• **A.** The *Sample solution* prepared as directed in the test for *Strength* gives a positive test for chromium, determined at 357.9 nm using the *Instrumental conditions* in the test for *Content of Chromium*.

STRENGTH

• CONTENT OF CHROMIUM

Standard stock solution A: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h, in water. Store in a polyethylene bottle.

Standard stock solution B: Transfer 1.0 mL of *Standard stock solution A* to a 100-mL volumetric flask, add 5.0 mL of 6 N hydrochloric acid, and dilute with water to volume to obtain a solution having a concentration of 10 µg/mL of chromium.

Standard solutions: Dilute *Standard stock solution B* with 0.125 N hydrochloric acid to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a porcelain crucible, heat the crucible in a muffle furnace maintained at about 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, inter-

mittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, mix, and filter, discarding the first 5 mL of the filtrate. Dilute this solution with 0.125 N hydrochloric acid to obtain a solution having a concentration of 2.5 µg/mL of chromium.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Chromium hollow-cathode

Flame: Air-acetylene

Analytical wavelength: 357.9 nm (chromium emission line)

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the *Samples*, using the *Blank*. From a linear regression equation, calculated using the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, determine the concentration, *C*, in µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of chromium in the *Sample solution* (µg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 95.0%–125.0%

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** (2040): Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

Clover, Red—see *Red Clover*

Cod Liver Oil—see *Cod Liver Oil General Monographs*

Cod Liver Oil Capsules

DEFINITION

Cod Liver Oil Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of Cod Liver Oil, where Cod Liver Oil is the partially destearinated fixed oil obtained from fresh livers of *Gadus morrhua* L. and other species of Fam. Gadidae. Cod Liver Oil contains, in each g, NLT 180 µg (600 USP Units) and NMT 750 µg (2500 USP Units) of vitamin A and NLT 1.5 µg (60 USP Units) and NMT 6.25 µg (250 USP Units) of vitamin D.

Cod Liver Oil may be flavored by the addition of NMT 1% of a suitable flavor or a mixture of flavors. A suitable antioxidant may be added.

IDENTIFICATION

• A. PRESENCE OF VITAMIN A

Sample solution: 25 mg/mL of oil contained in the Capsules in chloroform

Analysis: To 1 mL of the *Sample solution* add 10 mL of antimony trichloride TS.

Acceptance criteria: A blue color results immediately.

• B. FATTY ACID PROFILE

Antioxidant solution: 0.05 mg/mL of butylated hydroxytoluene in hexanes

System suitability solution: Prepare a mixture containing equal amounts of methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate in *Antioxidant solution*.

Standard stock solution: 45 mg/mL of USP Cod Liver Oil RS in *Antioxidant solution*

Standard solution: Transfer 2.0 mL of the *Standard stock solution* into a quartz tube, and evaporate with a gentle stream of nitrogen. Add 1.5 mL of a 2% solution of sodium hydroxide in methanol. Cap tightly with a polytetrafluoroethylene-lined cap, mix, and heat in a water bath for 7 min. Cool, add 2 mL of a 120 mg/mL solution of boron trichloride in methanol. Cover with nitrogen, cap tightly, and mix. Heat in a water bath for 30 min. Cool to 40°–50°. Add 1 mL of isooctane, cap, and mix in a vortex mixer or shake vigorously for at least 30 s. Immediately add 5 mL of saturated sodium chloride solution. Cover with nitrogen, cap, and mix in a vortex mixer or shake thoroughly for at least 15 s. Allow the upper layer to become clear, and transfer to a separate tube. Shake the methanol layer once more with 1 mL of isooctane, and combine the isooctane extracts. Wash the combined extracts twice with 1 mL of water, and dry over anhydrous sodium sulfate.

Sample solution: Proceed as directed in the *Standard solution*, except use a weighed quantity of the oil contained in the Capsules.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m fused silica capillary column coated with a 0.25-µm film of G16

Temperature

Injector: 250°

Detector: 280°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
170	1	225	20

Carrier gas: Helium

Split flow ratio: 1:200

Injection size: 1 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram from the *Standard solution* is similar to the Reference Chromatogram supplied with USP Cod Liver Oil RS. Identify the retention times of the relevant fatty acid methyl esters by comparing the chromatogram of the *Standard solution* with the Reference Chromatogram supplied with USP Cod Liver Oil RS.

Resolution: NLT 1.3 between methyl oleate and methyl *cis*-vaccinate, and that between methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement, *Standard solution*

Theoretical area percentages: 24.4 ± 1 for methyl palmitate, 24.8 ± 1 for methyl stearate, 25.2 ± 1 for methyl arachidate, and 25.6 ± 1 for methyl behenate, *System suitability solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the retention times of the relevant fatty acid methyl esters in the *Sample solution* by comparing the chromatogram of the *Sample solution* with that of the *Standard solution*.

Determine the number of fatty acid methyl ester peaks in the *Sample solution*: The number of fatty acid methyl ester peaks exceeding 0.05% of the total area of fatty acid methyl esters is at least 24, and the 24 largest peaks of the methyl esters account for more than 90% of the total area. (These correspond to the following, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4 n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, and 22:6 n-3.) Calculate the area percentage for each fatty acid methyl ester in the portion of Capsules taken:

$$\text{Result} = (r_A/r_B) \times 100$$

r_A = peak area of each individual fatty acid
 r_B = total area from all peaks, except the solvent peak and butylated hydroxytoluene

Acceptance criteria: The *Sample solution* meets the limits described in *Table 2*.

Table 2

Fatty Acid	Shorthand Notation	Lower Limit (area %)	Upper Limit (area %)
Saturated fatty acids			
Myristic acid	14:0	2.0	6.0
Palmitic acid	16:0	7.0	14.0
Stearic acid	18:0	1.0	4.0
Monounsaturated fatty acids			
Palmitoleic acid	16:1 n-7	4.5	11.5
cis-Vaccenic acid	18:1 n-7	2.0	7.0
Oleic acid	18:1 n-9	12.0	21.0
Gadoleic acid	20:1 n-11	1.0	5.5
Gondoic acid	20:1 n-9	5.0	17.0
Erucic acid	22:1 n-9	0	1.5
Cetoleic acid	22:1 n-11	5.0	12.0
Polyunsaturated fatty acids			
Linoleic acid	18:2 n-6	0.5	3.0
α-Linolenic acid	18:3 n-3	0	2.0
Moroctic acid	18:4 n-3	0.5	4.5
Eicosapentaenoic acid	20:5 n-3	7.0	16.0
Docosahexaenoic acid	22:6 n-3	6.0	18.0

STRENGTH

• VITAMIN A

Sample: 500 mg to 1 g of oil contained in the Capsules

Analysis: Proceed as directed under *Vitamin A Assay* (571).

Acceptance criteria: 180 µg (600 USP Units) to 750 µg (2500 USP Units) of vitamin A per g of oil contained in the Capsules

• VITAMIN D

Solution A: *n*-Amyl alcohol and dehydrated hexane (3:997)

Solution B: Acetonitrile, water, and phosphoric acid (96:3.8:0.2)

Butylated hydroxytoluene solution: 10 mg/mL of butylated hydroxytoluene in chromatographic hexane

Aqueous potassium hydroxide solution: 800 mg/mL of potassium hydroxide in freshly boiled water. Mix, and cool. [NOTE—Prepare this solution fresh daily.]

Alcoholic potassium hydroxide solution: Dissolve 3 g of potassium hydroxide in 50 mL of freshly boiled water. Add 10 mL of alcohol, and dilute with freshly boiled water to 100 mL. [NOTE—Prepare this solution fresh daily.]

Ascorbic acid solution: 100 mg/mL of ascorbic acid in water. [NOTE—Prepare this solution fresh daily.]

Internal standard solution: 5 µg/mL of USP

Ergocalciferol RS in alcohol

Standard stock solution: 5 µg/mL of USP

Cholecalciferol RS in alcohol

Standard solution: Transfer 2.0 mL of the *Standard stock solution* and 2.0 mL of the *Internal standard solution* to a round-bottomed flask. Proceed as directed in *Sample solution 1*, beginning with "Add 5 mL of...".

Sample solution 1: Transfer a quantity equivalent to 4.00 g of oil contained in the Capsules to a round-bottomed flask. Add 5 mL of *Ascorbic acid solution*, 100 mL of alcohol, and 10 mL of *Aqueous potassium hydroxide solution*, and mix. Reflux the mixture on a steam bath for 30 min. Add 100 mL of a 10 mg/mL sodium chloride solution. Cool rapidly under running water, and transfer the saponified mixture to a 500-mL separator, rinsing the saponification flask with 75 mL of a 10 mg/mL sodium chloride solution and then with 150 mL of a mixture of ether and hexane (1:1). Shake the combined saponified mixture and rinsings vigorously for 30 s, and allow to stand until both layers are clear. Discard the lower layer. Wash the ether-hexane extracts by shaking vigorously with 50 mL of *Alcoholic potassium hydroxide solution*, and then washing with three 50-mL portions of a 10 mg/mL sodium chloride solution. Pass the upper layer through 5 g of anhydrous sodium sulfate on a fast filter paper into a 250-mL flask suitable for a rotary evaporator. Wash the filter with 10 mL of a mixture of ether and hexane (1:1), and combine with the extract. Evaporate the solvent at reduced pressure at a temperature not exceeding 30°, and fill with nitrogen when the evaporation is complete. Alternatively evaporate the solvent under a gentle stream of nitrogen at a temperature not exceeding 30°. Dissolve the residue in 1.5 mL of *Solution A*. [NOTE—Gentle heating in an ultrasonic bath may be required. A large fraction of the white residue is cholesterol.]

Sample solution 2: To 4.00 g of oil contained in the Capsules add 2.0 mL of *Internal standard solution*, and proceed as directed for *Sample solution 1*, beginning with "Add 5 mL of...".

Clean-up chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Mobile phase: *Solution A*

Column: 25-mm × 4.6-cm stainless steel; packing L10

Injection size: 350 µL

Analysis (clean-up)

Samples: *Standard solution*, *Sample solution 1*, and *Sample solution 2*

Collect separately the eluates from 2 min before until 2 min after the retention time of cholecalciferol in a glass tube containing 1 mL of *Butylated hydroxytoluene solution* and fitted with a hermetic closure. Evaporate each tube under a stream of nitrogen at a temperature not exceeding 30°. Dissolve each residue in 1.5 mL of acetonitrile.

Analytical chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Mobile phase: *Solution B*

Column: 15-mm × 4.6-cm stainless steel; 5-μm packing L1

Injection size: 200 μL

System suitability

Sample: *Standard solution* (after the clean-up)

Suitability requirements

Resolution: NLT 1.4 between cholecalciferol and ergocalciferol

Relative standard deviation: NMT 2.0% for the cholecalciferol peak from replicate injections

Analysis

Samples: *Standard solution, Sample solution 1, and Sample solution 2* (after the clean-up)

Calculate the content of vitamin D, in μg/g, in the portion of oil taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

R_U = response of cholecalciferol relative to the corrected internal standard in *Sample solution 2*, as calculated below

R_S = response of cholecalciferol relative to the internal standard in the *Standard solution*

C_S = concentration of USP Cholecalciferol RS in the *Standard solution* (μg/mL)

C_U = concentration of oil in *Sample solution 2* (g/mL)

$$R_U = r_{U2}/[r_{S2} - (r_{S1} \times r_{U2}/r_{U1})]$$

r_{U2} = peak response of cholecalciferol from *Sample solution 2*

r_{S2} = peak response of the internal standard from *Sample solution 2*

r_{S1} = peak response of the internal standard from *Sample solution 1*

r_{U1} = peak response of cholecalciferol from *Sample solution 1*

Acceptance criteria: 1.5 μg (60 USP Units) to 6.25 μg (250 USP Units) of vitamin D per g of oil contained in the Capsules

• CONTENT OF COD LIVER OIL

Analysis: Weigh NLT 10 Capsules in a tared weighing bottle. With a sharp blade, or by other appropriate means, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of isooctane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the isooctane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per Capsule.

Acceptance criteria: 95.0%–105.0% of the labeled amount of cod liver oil

PERFORMANCE TESTS

- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements
- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Rupture Test for Soft Shell Capsules*

SPECIFIC TESTS

- **FATS AND FIXED OILS, Unsaponifiable Matter** <401>: NMT 1.30%
- **FATS AND FIXED OILS, Acid Value** <401>
Sample solution: Mix 15 mL of alcohol with 15 mL of ether, add 5 drops of phenolphthalein TS, and neutralize with 0.1 N sodium hydroxide. Dissolve 2.0 g

of oil contained in the Capsules in the mixture, and boil the oil solution gently under a reflux condenser for 10 min.

Analysis: Cool, and titrate the mixture with 0.1 N sodium hydroxide VS to the production of a pink color that persists after shaking for 30 s.

Acceptance criteria: NMT 1.0 mL of 0.1 N sodium hydroxide is required.

- **FATS AND FIXED OILS, Iodine Value** <401>: 145–180
- **FATS AND FIXED OILS, Saponification Value** <401>: 180–192
[NOTE—If carbon dioxide has been used as a preservative, expose the oil contained in the Capsules in a shallow dish in a vacuum desiccator for 24 h before weighing the specimen for determination of the saponification value.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers at room temperature. Protect from light.
- **LABELING:** Vitamin A potency and vitamin D potency, when designated on the label, may be expressed in USP Units per g of oil. The potency may also be expressed in metric units, on the basis that 1 USP Vitamin A Unit = 0.3 μg of all-*trans* retinol and 40 USP Vitamin D Units = 1 μg. Label them to emphasize the need to avoid freezing or exposure to excessive humidity or to a temperature above 40°. Where the content of docosahexaenoic acid and eicosapentaenoic acid is claimed, state the amount in mg per Capsule on the label.
- **USP REFERENCE STANDARDS** <11>
USP Cholecalciferol RS
USP Cod Liver Oil RS
USP Ergocalciferol RS
USP Vitamin A RS

Cranberry Liquid Preparation

DEFINITION

Cranberry Liquid Preparation is a bright red juice derived from the fruits of *Vaccinium macrocarpon* Ait. or *Vaccinium oxycoccos* L. (Fam. Ericaceae). It contains no added substances.

IDENTIFICATION

- **A. HPLC** The retention times of the quinic acid, malic acid, and citric acid peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the test for *Content of Organic Acids*.
- **B. ABSENCE OF ADULTERANTS**
Standard solution: 1.0 mg/mL of tartaric acid and 0.1 mg/mL of fumaric acid
Sample solution: Use the Liquid Preparation.
Mobile phase and Chromatographic system: Proceed as directed in the test for *Content of Organic Acids*.

Analysis**Samples:** *Standard solution* and *Sample solution***Injection size:** 20 μ L**Acceptance criteria:** The retention times of the tartaric acid and fumaric acid peaks of the *Standard solution* do not correspond to any of the retention times for peaks observed from the *Sample solution*.**COMPOSITION****• CONTENT OF DEXTROSE AND FRUCTOSE****Mobile phase:** Water**Standard solution:** 6.0 mg/mL of USP Dextrose RS and 2.0 mg/mL of USP Fructose RS in water**Sample solution:** Transfer 1.0 g of sodium carboxylate cation-exchange resin to a 50-mL beaker, add 5 mL of water to make a slurry, and transfer the slurry to a polypropylene automatic pipet fitted with a small plug of silanized glass wool. Quantitatively transfer the slurry to a small chromatographic tube, rinsing the beaker with water and packing the column evenly. Keep the column wet until ready for use. Using a volumetric pipet, transfer 1.0 mL of Liquid Preparation to the column, collect the eluate, and discard it. Pipet 4.0 mL of water onto the top of the column, collect the eluate in a clean vial, and filter if necessary.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** Refractive index**Columns****Guard:** Packing L19**Analytical:** 7.8-mm \times 30-cm; packing L19**Column temperature:** 85°**Flow rate:** 0.6 mL/min**Injection size:** 20 μ L**System suitability****Sample:** *Standard solution*

[NOTE—The approximate relative retention times for dextrose and fructose are about 0.8 and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 1.8 between the dextrose and fructose peaks**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentages of dextrose and fructose in the volume of Liquid Preparation taken:

$$\text{Result} = (r_U/r_S) \times (C_S/V) \times 0.5$$

 r_U = peak response of each appropriate analyte from the *Sample solution* r_S = peak response of each appropriate analyte from the *Standard solution* C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL) V = volume of Liquid Preparation taken for the *Sample solution* (mL)**Acceptance criteria:** NLT 2.4% dextrose and NLT 0.7% fructose**• CONTENT OF ORGANIC ACIDS****Mobile phase:** Transfer 27.2 g of monobasic potassium phosphate to a 1000-mL volumetric flask, and dissolve in 950 mL of water. Adjust with phosphoric acid to a pH of 2.4, and dilute with water to volume.**Standard solution:** 1.0 mg/mL each of USP Citric Acid RS, USP Malic Acid RS, and USP Quinic Acid RS**Sample solution:** Use the filtered Liquid Preparation.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 214 nm**Columns****Guard:** 5- μ m; packing L1[NOTE—Before use, condition the column with methanol, then with water, and finally with *Mobile phase*.]**Analytical:** 4.6-mm \times 25-cm analytical; packing L1**Flow rate:** 0.6 mL/min**Injection size:** 20 μ L**System suitability****Sample:** *Standard solution*

[NOTE—The approximate relative retention times for quinic acid, malic acid, and citric acid are 0.4, 0.5, and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 2.5 between quinic acid and malic acid**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentages of quinic acid, malic acid, and citric acid in the volume of Liquid Preparation taken:

$$\text{Result} = (r_U/r_S) \times C_S \times 0.1$$

 r_U = peak area of each appropriate analyte from the *Sample solution* r_S = peak area of each appropriate analyte from the *Standard solution* C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)**Acceptance criteria:** NLT 0.9% each of quinic acid and citric acid; NLT 0.7% of malic acid. The ratio of quinic acid to malic acid is NLT 1.0.**ADULTERANTS****• LIMIT OF SORBITOL AND SUCROSE****Mobile phase and Sample solution:** Prepare as directed in the test for *Content of Dextrose and Fructose*.**Standard solution:** 0.5 mg/mL each of USP Sorbitol RS and USP Sucrose RS**Chromatographic system:** Proceed as directed in the test for *Content of Dextrose and Fructose*.**System suitability****Sample:** *Standard solution*

[NOTE—The relative retention times for sucrose and sorbitol are about 0.4 and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 1.8 between the sucrose and sorbitol peaks**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution***Injection size:** 20 μ L

Calculate the percentages of sucrose and sorbitol in the volume of Liquid Preparation taken:

$$\text{Result} = (r_U/r_S) \times (C_S/V) \times 0.5$$

 r_U = peak response of each appropriate analyte from the *Sample solution* r_S = peak response of each appropriate analyte from the *Standard solution* C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL) V = volume of Liquid Preparation taken for the *Sample solution* (mL)**Acceptance criteria:** NMT 0.05% each of sorbitol and sucrose

SPECIFIC TESTS

- **REFRACTIVE INDEX** (831): 1.3435–1.3445
- **PH** (791): 2.5 ± 0.1

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store in a refrigerator.
- **LABELING:** The label states the Latin binomial name and, following the official name, the parts of the plant source from which the article was derived. The label also states that it is for manufacturing purposes only. This article is exempt from the requirements of the *General Notices* with respect to the pregnancy and lactation statement (section 10.40.50, *Labeling Botanical-Containing Products*).
- **USP REFERENCE STANDARDS** (11)
 - USP Citric Acid RS
 - USP Dextrose RS
 - USP Fructose RS
 - USP Malic Acid RS
 - USP Quinic Acid RS
 - USP Sorbitol RS
 - USP Sucrose RS

Cryptocodinium cohnii* Oil*DEFINITION**

Cryptocodinium cohnii Oil is obtained from the fermentation and extraction of algae of the species *Cryptocodinium cohnii* and contains NLT 35.0% (w/w) of docosahexaenoic acid (DHA, C₂₂H₃₂O₂) (C22: 6 n–3), as the only significant polyunsaturated fatty acid present. Suitable antioxidants in appropriate concentration may be added.

IDENTIFICATION

- **LONG-CHAIN UNSATURATED FATTY ACID PROFILE:** Proceed as directed in *Content of DHA*.

Analysis

Samples: *Standard Solution 2* and *Test Solution 1*
Calculate the area percentage for each fatty acid as methyl ester in *Test Solution 1*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual fatty acid as methyl ester

r_T = sum of all the peak responses, except the solvent and butylated hydroxytoluene peaks

Acceptance criteria: The retention time of the peaks of the docosahexaenoic acid methyl ester and the eicosapentaenoic acid methyl ester from *Test Solution 1* corresponds to that from *Standard Solution 2*, as obtained in the test for *Content of EPA and DHA*. The area percent for the methyl esters of the fatty acids from *Test Solution 1* in the test for *Content of EPA and DHA* meet the requirements for each fatty acid indicated in the table below.

Fatty Acid	Relative Retention Time	Shorthand Notation	Lower Limit (Area, %)	Upper Limit (Area, %)
Linoleic acid	0.52	18:2 n–6	0	1.0
Eicosapentaenoic acid	0.79	20:5 n–3	0	0.1
Docosapentaenoic acid	0.94	22:5 n–6	0	0.1
Docosahexaenoic acid	1.00	22:6 n–3	35.0	47.0

COMPOSITION**• CONTENT OF DHA**

Analysis: Proceed as directed in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile, Content of EPA and DHA*.

Acceptance criteria: NLT 35.0% (w/w) docosahexaenoic acid (DHA)

IMPURITIES**Inorganic Impurities****• LIMIT OF ARSENIC**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 μ L provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed under *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [CAUTION—Wear proper eye protection and protective clothing and gloves.]

Transfer approximately 500 mg of *Cryptocodinium cohnii* Oil, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the

microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of *Crypthecodinium cohnii* Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above

W = weight of *Crypthecodinium cohnii* Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon

flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of *Crypthecodinium cohnii* Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of *Crypthecodinium cohnii* Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• LIMIT OF CADMIUM

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before make up to final volume dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the

Sample solution, and the *Blank*, followed by an injection of 5 μL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in $\mu\text{g}/\text{mL}$, and calculate the regression line best fitting the points.

Determine the concentration, C , in $\mu\text{g}/\text{mL}$, of cadmium in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of cadmium in the *Crypthecodinium cohnii* Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of *Crypthecodinium cohnii* Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 $\mu\text{g}/\text{g}$

- **LIMIT OF MERCURY:** Proceed as directed in *Mercury* <261>, Method IIa, except use a *Standard Mercury Solution* having the equivalent of 0.1 $\mu\text{g}/\text{mL}$ of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*, combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution*.

Acceptance criteria: NMT 0.1 $\mu\text{g}/\text{g}$

SPECIFIC TESTS

- **FATS AND FIXED OILS, Anisidine Value** <401>: NMT 20.0
- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids)** <401>: The free fatty acids in 10 g require for neutralization NMT 1.42 mL of 0.1 N sodium hydroxide.
- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 5.0
- **FATS AND FIXED OILS, Total Oxidation Value (TOTOX)** <401>: NMT 26, calculated as

$$\text{Result} = (2 \times \text{PV}) + \text{AV}$$

 - USP Eicosapentaenoic Acid Ethyl Ester RS
 - USP Methyl Tricosanoate RS

Crypthecodinium cohnii Oil Capsules

DEFINITION

Crypthecodinium cohnii Oil Capsules are prepared from *Crypthecodinium cohnii* Oil and contain NLT 95.0% and NMT 105.0% of the labeled amount of docosahexaenoic acid (DHA, $\text{C}_{22}\text{H}_{32}\text{O}_2$) ($\text{C}_{22}:6 \text{ n}-3$).

IDENTIFICATION

- **LONG-CHAIN UNSATURATED FATTY ACID PROFILE:** Proceed as directed in *Content of DHA*.

Analysis

Samples: *Standard Solution 2* and *Test solution 1*
Calculate the area percentage for each fatty acid as methyl ester in *Test solution 1*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual fatty acid as methyl ester

r_T = sum of all the peak responses, except the solvent and butylated hydroxytoluene peaks

Acceptance criteria: The retention time of the peaks of the docosahexaenoic acid methyl ester and the eicosapentaenoic acid methyl ester from *Test solution 1* corresponds to that from *Standard Solution 2*, as obtained in the test for *Content of EPA and DHA*. The area percent for the methyl esters of the fatty acids from *Test solution 1* in the test for *Content of EPA and DHA* meet the requirements for each fatty acid indicated in *Table 1*.

Table 1

Fatty Acid	Relative Retention Time	Shorthand Notation	Lower Limit (Area, %)	Upper Limit (Area, %)
Linoleic acid	0.52	18:2 n-6	0	1.0
Eicosapentaenoic acid	0.79	20:5 n-3	0	0.1
Docosapentaenoic acid	0.94	22:5 n-6	0	0.1
Docosahexaenoic acid	1.00	22:6 n-3	35.0	47.0

STRENGTH

• CONTENT OF DHA

Test solution 1 and Test solution 2: Weigh NLT 10 Capsules in a tared weighing bottle. With a sharp blade or other appropriate means, carefully open the Capsules, without loss of the shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied capsules by washing with several small portions of isooctane. Discard the washings, and allow the empty capsules to dry in a current of dry air until the isooctane is completely evaporated. Weigh the empty capsules in the original tared weighing bottle, and calculate the average fill weight (AFW) of *Crypthecodinium cohnii* oil/Capsule. Proceed with the content of capsules as directed in the *Analysis*.

Analysis: Proceed as directed in *Fats and Fixed Oils* <401>, *Omega-3 Fatty Acids Determination and Profile, Content of EPA and DHA*.

Calculate the percentage of the labeled amount of docosahexaenoic acid (DHA) in the Capsules taken:

$$\text{Result} = R \times \text{AFW}/L$$

R = determined percentage of DHA in the portion of oil taken from the Capsules (%)

AFW = average fill weight of the Capsules taken (mg)

L = labeled amount of DHA (mg/Capsule)

Acceptance criteria: NLT 95.0% and NMT 105.0% of the labeled amount of DHA

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Rupture Test for Soft Shell Capsules*

- **WEIGHT VARIATION (2091):** Meet the requirements

IMPURITIES

Inorganic Impurities

- **LIMIT OF ARSENIC**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 μ L provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in the test for *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [CAUTION—Wear proper eye protection and protective clothing and gloves.]

Transfer approximately 500 mg of *Crypthecodinium cohnii* oil from Capsules, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature.

[NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into

25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 μ L) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 μ L of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in μ g/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in μ g/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above

W = weight of Capsules content taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 μ g/g

- **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 μ L provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for

10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of the *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of lead in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above

W = weight of Capsules content taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• LIMIT OF CADMIUM

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before make up to final volume dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of the *Solution C* for each of the samples, into

the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of cadmium in the Capsules taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above

W = weight of Capsules content taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF MERCURY:** Proceed as directed in *Mercury* (261), *Method IIa*, except use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*, combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution*.

Acceptance criteria: NMT 0.1 µg/g

SPECIFIC TESTS

- **FATS AND FIXED OILS, Anisidine Value (401):** NMT 20.0, determined on the contents of the Capsules
- **FATS AND FIXED OILS, Free Fatty Acids (401):** The free fatty acids in 10 g require for neutralization NMT 1.42 mL of 0.1 N sodium hydroxide.
- **FATS AND FIXED OILS, Peroxide Value (401):** NMT 5.0, determined on the contents of the Capsules
- **FATS AND FIXED OILS, Total Oxidation Value (TOTOX) (401):** NMT 26 (determined on the contents of the Capsules), calculated as

$$\text{Result} = (2 \times \text{PV}) + \text{AV}$$

PV = peroxide value

AV = anisidine value

- **FATS AND FIXED OILS, Unsaponifiable Matter (401):** NMT 3.5%, determined on the contents of the Capsules
- **SPECIFIC GRAVITY (841):** 0.91–0.93, determined on the contents of the Capsules

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **LABELING:** The label states the content of docosahexaenoic acid in mg/Capsule. It also states the name and concentration of any added antioxidant.
- **USP REFERENCE STANDARDS (11)**
 - USP Docosahexaenoic Acid Ethyl Ester RS
 - USP Eicosapentaenoic Acid Ethyl Ester RS
 - USP Methyl Tricosanoate RS

Curcuminoids

DEFINITION

Curcuminoids is a partially purified natural complex of diaryl heptanoid derivatives isolated from Turmeric, *Curcuma longa* L. It contains NLT 95.0% of curcuminoids, calculated on the dried basis, as the sum of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin. It contains NLT 70.0% and NMT 80.0% of curcumin, NLT 15.0% and NMT 25.0% of desmethoxycurcumin, and NLT 2.5% and NMT 6.5% of bisdesmethoxycurcumin.

IDENTIFICATION**A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.2 mg/mL of USP Curcuminoids RS in acetone

Sample solution: 2 mg/mL of Curcuminoids in acetone

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 µL, as bands

Developing solvent system: Chloroform, methanol, and formic acid (96:4:1)

Analysis

Samples: *Standard solution* and *Sample solution*
Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>, *Thin-Layer Chromatography*). Use saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine under UV light at 365 nm.

Acceptance criteria: The *Sample solution* chromatogram shows yellowish-brown bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin at R_f values of about 0.4, 0.6, and 0.7, respectively, corresponding in position and color to those obtained from the *Standard solution*.

- B.** The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* chromatogram correspond to those of the *Standard solution* for the appropriate USP Reference Standard, as obtained in the test for *Content of Curcuminoids*.

COMPOSITION**C. CONTENT OF CURCUMINOIDS**

Mobile phase: Tetrahydrofuran and 1 mg/mL of citric acid in water (4:6)

[NOTE—Sonication may be necessary to dissolve the RS in each *Standard solution*; all solutions should be passed through a filter with 0.45-µm pore size before injection. USP Curcumin RS, USP Desmethoxycurcumin, and USP Bisdesmethoxycurcumin RS can also be prepared in one standard solution containing the final concentration specified below for each.]

Standard solution A: 40 µg/mL of USP Curcuminoids RS in *Mobile phase*

Standard solution B: 40 µg/mL of USP Curcumin RS in *Mobile phase*

Standard solution C: 10 µg/mL of USP Desmethoxycurcumin RS in *Mobile phase*

Standard solution D: 2 µg/mL of USP Bisdesmethoxycurcumin RS in *Mobile phase*

Sample solution: Transfer about 20 mg of Curcuminoids to a 50-mL volumetric flask, add about 30 mL of acetone, and sonicate for 30 min. Dilute with acetone to volume and centrifuge. Transfer 5 mL to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 420 nm

Column: 4.6-mm × 20-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution A*

[NOTE—The relative retention times for the curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin peaks are 1.0, 1.2, and 1.4, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution A* is similar to the Reference Chromatogram provided with USP Curcuminoids RS.

Resolution: NLT 2.0, between curcumin and desmethoxycurcumin peaks and the desmethoxycurcumin and bisdesmethoxycurcumin peaks

Tailing factor: NMT 1.5 for bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin peaks

Relative standard deviation: NMT 2.0% for desmethoxycurcumin peak, in repeated injections

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, and *Sample solution*

Calculate the percentage of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin in the portion of Curcuminoids taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for curcumin, desmethoxycurcumin, or bisdesmethoxycurcumin from the *Sample solution*

r_S = peak response for curcumin, desmethoxycurcumin, or bisdesmethoxycurcumin from the appropriate *Standard solution*

C_S = concentration of the appropriate *Standard solution* (mg/mL)

C_U = concentration of Curcuminoids in the *Sample solution* (mg/mL)

Acceptance criteria: Curcuminoids contains NLT 95.0% of curcuminoids, calculated on the dried basis, as the sum of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin. It contains NLT 70.0% and NMT 80.0% of curcumin, NLT 15.0% and NMT 25.0% of desmethoxycurcumin, and NLT 2.5% and NMT 6.5% of bisdesmethoxycurcumin.

CONTAMINANTS

- HEAVY METALS, Method III <231>:** NMT 20 ppm
- ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues <561>:** Meets the requirements
- ARTICLES OF BOTANICAL ORIGIN, Test for Aflatoxins <561>:** Meets the requirements
- MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- MICROBIOLOGICAL PROCEDURE FOR ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- MELTING RANGE OR TEMPERATURE, Class I <741>:** 172°–178°
- LOSS ON DRYING <731>:** Dry 1.0 g at 105° for 2 h: it loses NMT 2.0% of its weight.
- ARTICLES OF BOTANICAL ORIGIN, Total Ash <561>:** NMT 1.0%

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers; protect from light and moisture, and store at room temperature.
- LABELING:** The label states the content of curcuminoids and the content of the individual curcuminoids, on the dried basis; and the Latin binomial and the part of the plant used to prepare the article.
- USP REFERENCE STANDARDS <11>**
 - USP Bisdesmethoxycurcumin RS
 - USP Curcumin RS
 - USP Curcuminoids RS
 - USP Desmethoxycurcumin RS

Curcuminoids Capsules

DEFINITION

Curcuminoids Capsules are prepared from Curcuminoids and contain NLT 90.0% and NMT 110.0% of the labeled amount of curcuminoids, calculated as the sum of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin.

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHY

Standard solution: 0.2 mg/mL of USP Curcuminoids RS in acetone

Sample solution: Weigh and finely powder the contents of NLT 20 Capsules. Transfer a portion of the powder, equivalent to about 10 mg of curcuminoids, to a suitable container, add 5 mL of acetone, shake for 1 min, and sonicate for 10 min. Allow to stand for 15 min before use.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μm (TLC plates)

Application volume: 10 μL , as bands

Developing solvent system: Chloroform, methanol, and formic acid (96:4:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine under UV light at 365 nm.

Acceptance criteria: The *Sample solution* chromatogram shows yellowish-brown bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin at R_f values of about 0.4, 0.6, and 0.7, respectively, corresponding in position and color to those obtained from the *Standard solution*.

- B.** The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* correspond to those of the *Standard solution* for the appropriate USP Reference Standard, as obtained in the test for *Content of Curcuminoids*.

STRENGTH

CONTENT OF CURCUMINOIDS

Mobile phase: Tetrahydrofuran and 1 mg/mL of citric acid in water (4:6)

[NOTE—Sonication may be necessary to dissolve the RS in each *Standard solution*; all solutions should be passed through a filter with 0.45- μm pore size before injection. USP Curcumin RS, USP Desmethoxycurcumin RS, and USP Bisdesmethoxycurcumin RS can also be prepared in one standard solution containing the final concentration specified below for each.]

Standard solution A: 40 μg /mL of USP Curcuminoids RS in *Mobile phase*

Standard solution B: 40 μg /mL of USP Curcumin RS in *Mobile phase*

Standard solution C: 10 μg /mL of USP Desmethoxycurcumin RS in *Mobile phase*

Standard solution D: 2 μg /mL of USP Bisdesmethoxycurcumin RS in *Mobile phase*

Sample stock solution: Weigh and finely powder the contents of NLT 20 Capsules. Transfer an accurately weighed amount of the powder, equivalent to about 20 mg of curcuminoids, to a 50-mL volumetric flask. Add about 30 mL of acetone, sonicate for 30 min, dilute with acetone to volume, mix, and centrifuge.

Sample solution: Dilute a portion of the *Sample stock solution* 1 in 10 with *Mobile phase*, and mix.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV-Vis 420 nm

Column: 4.6-mm \times 20-cm; 5- μm packing L1

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution A*

[NOTE—The relative retention times for the curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin peaks are about 1.0, 1.2, and 1.4, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the Reference Chromatogram provided with the lot of USP Curcuminoids RS being used.

Resolution: NLT 2.0 between the curcumin and desmethoxycurcumin peaks and the desmethoxycurcumin and bisdesmethoxycurcumin peaks

Tailing factor: NMT 1.5 for the bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin peaks

Relative standard deviation: NMT 2.0% for desmethoxycurcumin peak, in repeated injections

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, and *Sample solution*

Calculate the quantity, in mg, of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin in each Capsule:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times (W_F/W_U)$$

r_U = peak area for curcumin, desmethoxycurcumin, or bisdesmethoxycurcumin from the *Sample solution*

r_S = peak area for curcumin, desmethoxycurcumin, or bisdesmethoxycurcumin from the appropriate *Standard solution*

C_S = concentration of the appropriate *Standard solution* (mg/mL)

D = dilution factor to prepare the *Sample solution* from *Sample stock solution*

V = volume of *Sample stock solution* (mL)

W_F = average fill weight of Capsules (mg)

W_U = weight of content of Capsules taken to prepare the *Sample stock solution* (mg)

Calculate the percentage of the labeled amount of curcuminoids in the Capsule:

$$\text{Result} = (\Sigma Q/L) \times 100$$

ΣQ = sum of the quantities of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin in the Capsule (mg)

L = labeled amount of curcuminoids (mg/Capsule)

Acceptance criteria: 90.0%–110.0% of the label claim

PERFORMANCE TESTS

DISINTEGRATION AND DISSOLUTION <2040>

Mode: Dissolution

Medium: Water containing 1% sodium lauryl sulfate; 900 mL

Apparatus 2: 100 rpm

Time: 60 min

Sample solution: Combine 25-mL portions of the solution under test from each of the six dissolution vessels, and mix. Transfer 5 mL to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

Analysis: Determine the amount of curcumin ($\text{C}_{21}\text{H}_{20}\text{O}_6$) dissolved by using the method used in *Strength*, making any necessary modifications.

Tolerances: NLT 75% of the content of curcumin ($\text{C}_{21}\text{H}_{20}\text{O}_6$) is dissolved.

- **WEIGHT VARIATION** (2091): Meet the requirements

CONTAMINANTS

Cyanocobalamin—see *Cyanocobalamin General Monographs*

Cysteine Hydrochloride—see *Cysteine Hydrochloride General Monographs*

Cysteine

$C_6H_{12}N_2O_4S_2$ 240.30
 L-Cystine;
 3,3'-Disulfanedibis [(2*R*)-2-aminopropanoic acid] [56-89-3].

DEFINITION

Cystine contains NLT 98.5% and NMT 101.5% of $C_6H_{12}N_2O_4S_2$, as L-Cystine, calculated on the dried basis.

IDENTIFICATION**• A. INFRARED ABSORPTION <197K>****• B. OPTICAL ROTATION, Specific Rotation <781S>** −215 to −225, determined at 20°

Sample solution: 20 mg/mL, in 1 N hydrochloric acid

- C.** The R_f value of the principal spot of the *Sample solution* in the test for *Organic Impurities* corresponds to that of the *Standard solution*.

ASSAY**• PROCEDURE**

Sample solution: Transfer about 0.1 g of Cystine to a glass-stoppered flask, and dissolve in a mixture of 2 mL of dilute sodium hydroxide (1 in 20) and 10 mL of water. Add 10 mL of potassium bromide solution (200 g/L in water), 50.0 mL of 0.1 N potassium bromate VS, and 15 mL of dilute hydrochloric acid (17 in 100). Immediately insert the stopper into the flask, and cool in an ice water bath. Allow to stand protected from light for 10 min.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 0.1 N potassium bromate VS

Back-titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Colorimetric

Equivalency: Each mL of 0.1 N potassium bromate VS is equivalent to 2.403 mg of $C_6H_{12}N_2O_4S_2$ on the dried basis.

Analysis: Add 1.5 g of potassium iodide, and after 1 min, titrate with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction.

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES**Inorganic Impurities****• RESIDUE ON IGNITION <281>** NMT 0.1%**• CHLORIDE AND SULFATE, Chloride <221>** NMT 200 ppm. A 0.7-g portion shows no more chloride than corresponds to 0.40 mL of 0.01 N hydrochloric acid.**• CHLORIDE AND SULFATE, Sulfate <221>** NMT 200 ppm. A 1.2-g portion shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid.**• IRON <241>** NMT 10 ppm**• HEAVY METALS, Method I <231>** NMT 10 ppm**Organic Impurities****• PROCEDURE**

Standard solution: Dissolve a quantity of USP Cystine RS in 1 N hydrochloric acid, and dilute with water to obtain a solution having a known concentration of about 0.02 mg/mL.

Sample solution: Dissolve a quantity of Cystine in 1 N hydrochloric acid, and dilute with water to obtain a solution having a known concentration of about 10 mg/mL.

System suitability solution: Dissolve quantities of USP Cystine RS and USP Arginine Hydrochloride RS in 1 N hydrochloric acid, and dilute with water to obtain a solution having a known concentration of about 0.4 mg/mL each.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: A 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: A mixture of ammonia and 2-propanol (3:7)

Spray reagent: Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butanol and 2 N acetic acid (95:5).

Analysis

Samples: *Standard solution*, *Sample solution*, and *System suitability solution*

Proceed as directed for *Chromatography* <621>, *Thin-Layer Chromatography*. After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for about 15 min. Examine the plate. The chro-

matogram from the *System suitability solution* exhibits two clearly separated spots.

Acceptance criteria: Any secondary spot from the *Sample solution* is not larger or more intense than the principal spot from the *Standard solution*.

Individual impurities: NMT 0.2%

Total impurities: NMT 2.0%

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.2% of its weight.

ADDITIONAL REQUIREMENTS

Diosmin

$C_{28}H_{32}O_{15}$ 608.54

5-Hydroxy-2-(3-hydroxy-4-methoxyphenyl)-7-[(2*S*,3*R*,4*S*,5*S*,6*R*)-3,4,5-trihydroxy-6-[[[(2*R*,3*R*,4*R*,5*R*,6*S*)-3,4,5-trihydroxy-6-methyloxan-2-yl]oxymethyl]oxan-2-yl]oxychromen-4-one;

7-[[6-O-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-4*H*-1-benzopyran-4-one [520-27-4].

DEFINITION

Diosmin contains NLT 90.0% and NMT 102.0% of diosmin ($C_{28}H_{32}O_{15}$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Methanol, acetonitrile, acetic acid, and water (27:2:6:65)

Standard solution: 1.0 mg/mL of USP Diosmin RS in dimethyl sulfoxide

System suitability solution: 1 mg/mL of USP Diosmin for System Suitability RS in dimethyl sulfoxide

Sample solution: 1.0 mg/mL of Diosmin in dimethyl sulfoxide

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection size: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*.

[NOTE—Allow the run time about 6 times the diosmin retention time. The relative retention times for diosmin, acetoisovanillone, hesperidin, isorhoifolin, linarin, and diosmetin are 1, 0.5, 0.6, 0.8, 2.6, and 4.5, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the Reference Chromatogram provided with the USP Diosmin for System Suitability RS being used.

Resolution: NLT 2.5 between hesperidin and isorhoifolin, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of diosmin ($C_{28}H_{32}O_{15}$), in the portion of Diosmin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Diosmin RS in the *Standard solution* (mg/mL)

C_U = concentration of Diosmin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–102.0% on the anhydrous basis

IMPURITIES

RESIDUE ON IGNITION (281)

Sample: 1.0 g

Acceptance criteria: NMT 0.2%

HEAVY METALS, Method II (231)

Sample: 2.0 g

Acceptance criteria: NMT 20 ppm

LIMIT OF IODINE

Determine the total content of iodine by potentiometry, using an iodide-selective electrode, after oxygen flask combustion (see *Oxygen Flask Combustion* (471)).

Sample solution: [CAUTION—Observe rigorously the precautions set forth for *Procedure* under *Oxygen Flask Combustion* (471).] Wrap 0.100 g of Diosmin in a piece of free-halide filter paper, and place it in the platinum gauze specimen holder. Introduce into the flask 50.0 mL of a 0.2 g/L solution of hydrazine. Flush the flask with oxygen for 10 min. Ignite the filter paper. Stir the contents of the flask immediately after the end of the combustion to dissolve completely the combustion products. Continue stirring for 1 h.

Standard solution: 33.2 μg/mL of potassium iodide in water, equivalent to 25.4 μg/mL of iodine

Potassium nitrate solution: 200 mg/mL of potassium nitrate in 0.1 M nitric acid

Analysis

Samples: *Sample solution* and *Standard solution*

Transfer 30 mL of *Potassium nitrate solution* to a beaker, immerse the electrodes, and stir for 10 min. The potential (nU_i) must remain stable. Measure the potential (nU_i). Add 1 mL of the *Sample solution*, and measure the potential (nU_2).

Transfer 30 mL of *Potassium nitrate solution* to a beaker, immerse the electrodes, and stir for 10 min. The potential (nS_i) must remain stable. Measure the

potential (nS_1). Add 80 μ L of the *Standard solution*, and measure the potential (nS_2).

Acceptance criteria: NMT 0.1%: The absolute value $|(nU_2) - (nU_1)|$ is not higher than the absolute value $|(nS_2) - (nS_1)|$.

• RELATED COMPOUNDS

Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 0.05 mg/mL of USP Diosmin RS in dimethyl sulfoxide

System suitability

Sample: *System suitability solution*. [NOTE—Allow the run time about 6 times that of the diosmin retention time. The relative retention times for diosmin, acetoisovanillone, hesperidin, isorhoifolin, linarin, and diosmetin are 1, 0.5, 0.6, 0.8, 2.6, and 4.5, respectively.]

System suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the Reference Chromatogram provided with the USP Diosmin for System Suitability RS being used.

Resolution: NLT 2.5 between hesperidin and isorhoifolin, *System suitability solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Diosmin taken: [NOTE—Disregard any impurity less than 0.1%.]

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response for diosmin from the *Standard solution*

C_S = concentration of USP Diosmin RS in the *Standard solution* (mg/mL)

C_U = concentration of Diosmin in the *Sample solution* (mg/mL)

F = correction factor for each individual impurity (see Table 1)

Acceptance criteria

Total impurities: NMT 10%

Individual impurities: See Table 1.

Total other impurities and acetoisovanillone: NMT 1%

SPECIFIC TESTS

• **WATER DETERMINATION, Method 1a (921)**

Sample: 0.3 g

Acceptance criteria: NMT 6.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Diosmin RS

USP Diosmin for System Suitability RS

Echinacea angustifolia

DEFINITION

Echinacea angustifolia consists of the dried rhizome and roots of *Echinacea angustifolia* DC. (Fam. Asteraceae). It is harvested in the fall after 1 or more years of growth. It contains NLT 0.5% of total phenols, calculated on the dried basis as the sum of caffeic acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), chlorogenic acid ($C_{16}H_{18}O_9$), dicaffeoylquinic acids ($C_{25}H_{24}O_{12}$), and echinacoside ($C_{35}H_{46}O_{20}$). It contains NLT 0.075% of dodecatetraenoic acid isobutylamides ($C_{16}H_{25}NO$) on the dried basis.

IDENTIFICATION

• **A. PRESENCE OF ECHINACOSIDE AND DICAFFEYOYLQUINIC ACIDS (CYNARIN(E))**

Standard solution A: 20 mg/mL of USP Powdered *Echinacea angustifolia* Extract RS in methanol

Standard solution B: 1 mg/mL of 1,3-dicaffeoylquinic acid in methanol

Sample solution: Weigh and finely pulverize 10 g of *Echinacea angustifolia*, and transfer about 1 g of the powder to a suitable extraction thimble. Transfer the thimble to a continuous extraction apparatus, and extract with 50 mL of chloroform for 1 h. Retain the chloroform extract for *Identification* test B. Continue the extraction with 50 mL of methanol, and concentrate to a small volume at 40° in vacuum. With the aid of methanol, transfer the extract to a 10-mL volumetric flask, and dilute with methanol to volume.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 μ L

Developing solvent system: Ethyl acetate, formic acid, and water (17:2:1)

Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and then examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram obtained from the *Sample solution* shows a yellowish zone at an R_f value of 0.14 characteristic of echinacoside (absent or only traces present in *Echinacea purpurea*) that corresponds in color and R_f value to that in the chromatogram of *Standard solution A*, and another zone characteristic of 1,3-dicaffeoylquinic acid (absent in *Echinacea pallida* and *Echinacea purpurea*) corresponding in color and R_f value to that in the chromatogram of *Standard solution B*. Other colored zones of varying intensities may be observed in the chromatogram of the *Sample solution*.

• **B. PRESENCE OF ISOBUTYLALKENYLAMIDES**

Standard solution A: Transfer a quantity of USP Powdered *Echinacea angustifolia* Extract RS to a centrifuge tube, and add chloroform to obtain a solution having a known concentration of about 100 mg/mL. Shake by hand to disperse, sonicate for 5 min, and centrifuge. Use the supernatant.

Standard solution B: 1 mg/mL of β -sitosterol in methanol

Sample solution: Evaporate the chloroform extract retained from preparation of the *Sample solution* in *Identification test A* to dryness at 40° in vacuum. To the residue, add 1 mL of alcohol, and pass through a nylon membrane filter of 0.45- μ m pore size.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 μ L

Developing solvent system: Hexane and ethyl acetate (2:1)

Spray reagent: Prepare a mixture of glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (10:5:0.5) in an ice bath

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Examine the plate under UV light at 254 nm, and then spray the plate with *Spray reagent*, and heat the plate at 100° for 5 min.

Acceptance criteria

Under UV light at 254 nm: The chromatogram obtained from the *Sample solution* shows one main zone at an R_f value of about 0.25 due to 2*E*,4*E*,8*Z*,10*E*-dodecatetraenoic acid isobutylamide and dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide (absent in *Echinacea pallida*) that corresponds in R_f value to that in the chromatogram of *Standard solution A*.

After treatment with *Spray reagent* and heating: The chromatogram obtained from the *Sample solution* shows a zone due to β -sitosterol that corresponds in R_f value to the principal spot in the chromatogram of *Standard solution B*. Below this spot, there is a zone due to dodeca-2*E*,4*E*,8*Z*,10*E*-tetraenoic acid isobutylamide and to dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide that corresponds in R_f value to that in the chromatogram of *Standard solution A*; and below this spot, there are several yellowish zones due to α , β -unsaturated isobutylamides (absent in *Echinacea pallida* and mostly violet in *Echinacea purpurea* due to the presence of α , β , γ , δ -unsaturated isobutylamides) that are not visible or are very weak when viewed under UV light at 254 nm.

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the echinacoside peak of *Standard solution A*, and the retention time of the peak for 1,3-dicaffeoylquinic acid from the *Sample solution* corresponds to that of *Standard solution A*, all peaks as obtained in the test for *Content of total phenols*.

COMPOSITION

• **CONTENT OF TOTAL PHENOLS**

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: Dissolve USP Powdered *Echinacea angustifolia* Extract RS in *Solvent*, shaking and heating in a water bath. Dilute with *Solvent* to obtain a solution having a known concentration of 1 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 40 μ g/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer about 125 mg of finely powdered *Echinacea angustifolia* (capable of passing through a 40-mesh sieve), accurately weighed, to a round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux, while shaking by mechanical means for 15 min. Centrifuge, or pass through a membrane filter having a 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the Reference Chromatogram for total phenols provided with the USP Powdered *Echinacea angustifolia* Extract RS.

Resolution: NLT 1.0 between the 1,3-dicaffeoylquinic acid isomer and echinacoside, *Standard solution A*

Capacity factor (k'): NLT 3.0, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram from the *Sample solution* by comparison with the chromatogram from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caftaric acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), chlorogenic acid ($C_{16}H_{18}O_9$), dicaffeoylquinic acids ($C_{25}H_{24}O_{12}$), and echinacoside ($C_{35}H_{46}O_{20}$) in the portion of *Echinacea angustifolia* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak response for the relevant analyte from the *Sample solution*

- r_s = peak response for chlorogenic acid from *Standard solution B*
 C_s = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)
 V = volume of the *Sample solution* (mL)
 W = weight of *Echinacea angustifolia* taken to prepare the *Sample solution* (mg)
 F = response factor: chicoric acid, 0.695; dicaffeoylquinic acids, 0.729; caftaric acid, 0.881; chlorogenic acid, 1.000; and echinacoside, 2.220

Calculate the percentage of total phenols in the portion of *Echinacea angustifolia* taken by adding the individual percentages calculated.

Acceptance criteria: NLT 0.5% of total phenols on the dried basis

• **CONTENT OF DODECATETRAENOIC ACID ISOBUTYLAMIDES**

Mobile phase: Acetonitrile and water (55:45)

Standard solution A: Dissolve, with sonication, USP Powdered *Echinacea angustifolia* Extract RS in methanol, shaking for 10 min, and dilute with methanol to obtain a solution having a concentration of 5 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 10 μ g/mL of USP 2E,4E-Hexadienoic Acid Isobutylamide RS in methanol

Sample solution: Transfer about 2.5 g, accurately weighed, of finely powdered *Echinacea angustifolia* (capable of passing through a 40-mesh sieve) to a round-bottom flask. Add 80 mL of methanol, and reflux for 30 min. Cool to room temperature, and filter into a 100-mL volumetric flask, using small portions of methanol to rinse the flask and the filter. Dilute with methanol to volume. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 25 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the Reference Chromatogram for alkamides provided with USP Powdered *Echinacea angustifolia* Extract RS.

Resolution: NLT 1.0 between dodecatetraenoic acid isobutylamide peaks, *Standard solution A*

Tailing factor: NMT 2.0 for the 2E,4E-hexadienoic acid isobutylamide peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the 2E, 4E-hexadienoic acid isobutylamide peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks due to 2E,4E,8Z,10E-dodecatetraenoic acid isobutylamide and 2E,4E,8Z,10Z-dodecatetraenoic acid isobutylamide in the chromatogram from the *Sample solution* by comparison with the chromatogram from *Standard solution A*. Measure the areas for the relevant peaks. Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of *Echinacea angustifolia* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

- r_U = sum of the peak responses of the relevant analytes from the *Sample solution*

- r_s = peak response for 2E,4E-hexadienoic acid isobutylamide from *Standard solution B*
 C_s = concentration of USP 2E,4E-Hexadienoic Acid Isobutylamide RS in *Standard solution B* (mg/mL)
 V = volume of the *Sample solution* (mL)
 W = weight of *Echinacea angustifolia* taken to prepare the *Sample solution* (mg)
 F = response factor for 2E,4E-hexadienoic acid isobutylamide, 1.353

Acceptance criteria: NLT 0.075% of dodecatetraenoic acid isobutylamides ($C_{16}H_{25}NO$) on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS

• **BOTANIC CHARACTERISTICS**

Macroscopic: The outer surface of the rhizome is pale to yellowish brown, crowned with remains of the aerial stem, and sometimes showing surface annulations up to 15 mm in diameter. The roots are also pale to yellowish brown, cylindrical or slightly tapering, sometimes spirally twisted, longitudinally wrinkled and deeply furrowed, up to 4–10 mm in diameter, and passing imperceptibly into rhizome. The fracture is short when dry and becomes tough and pliable on exposure to air.

Microscopic: The rhizomes and roots in transverse section show a thin outer bark separated from a wide xylem by a distinct cambial line. The cork is composed of several rows of thin-walled cells containing yellowish-brown pigment. The rhizome has a small circular pith, occasional small groups of thick-walled, lignified fibers in the pericycle, and a parenchymatous cortex. The phloem and xylem are composed of narrow strands of vascular tissue separated by wide, nonlignified medullary rays. Xylem vessels are lignified, 25–75 μ m in diameter, usually with reticulate thickening but occasionally with spiral or annular thickening. Sclereids occur singly or in small groups, varying considerably in size and shape from rounded to rectangular to elongated and fiber-like, up to 300 μ m long and 20–40 μ m wide, with intercellular spaces forming schizogenous oleoresin canals that are 80–150 μ m in diameter and contain a dense black deposit. The canals are present outside of the central cylinder only (unlike *Echinacea pallida*, where they are present both inside and outside of the central cylinder). Spherocrystalline masses of inulin occur throughout the parenchymatous tissues. Lignified fibers, 300–800 μ m long, are present in scattered groups, and are usually surrounded by phytomelanin (unlike fibers in *Echinacea pallida*, where they usually occur singly in the periphery of the cortex and are 100–300 μ m long, with phytomelanin often absent).

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 3.0%
- **LOSS ON DRYING** (731): Dry at 105° for 2 h: it loses NMT 10.0%.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 7.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* (561): NMT 4.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in well-closed, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Examine the plate under UV light at 254 nm. Spray the plate with *Spray reagent*, and then heat the plate at 100° for 5 min.

Acceptance criteria

Under UV light: The chromatogram obtained from the *Sample solution* shows one main zone at an R_f value of about 0.25 due to 2*E*,4*E*,8*Z*,10*E*-dodecatetraenoic acid isobutylamide and dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide (absent in *E. pallida*) that corresponds in R_f value to that in the chromatogram of *Standard solution A*.

After treatment with *Spray reagent* and heating: The chromatogram obtained from the *Sample solution* shows a zone due to β -sitosterol that corresponds in R_f value to the principal spot in the chromatogram of *Standard solution B*. Below this spot, there is a zone due to dodeca-2*E*,4*E*,8*Z*,10*E*-tetraenoic acid isobutylamide and to dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide that corresponds in R_f value to that in the chromatogram of *Standard solution A*; and below this spot, there are several yellowish zones due to α,β -unsaturated isobutylamides (absent in *Echinacea pallida* and mostly violet in *Echinacea purpurea* due to the presence of $\alpha,\beta,\gamma,\delta$ -unsaturated isobutylamides) that are not visible or are very weak when viewed under UV light at 254 nm.

- **C.** In the test for *Content of Total Phenols* the retention time of the major peak of the *Sample solution* corresponds to that of the echinacoside peak of *Standard solution A*, and a peak is detected at the retention time for 1,3-dicaffeoylquinic acid from the *Sample solution* corresponding to that of *Standard solution A*.

COMPOSITION

- **CONTENT OF TOTAL PHENOLS**

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: Dissolve USP Powdered *Echinacea angustifolia* Extract RS in *Solvent*, shaking and heating in a water bath. Dilute with *Solvent* to obtain a solution having a known concentration of 1 mg/mL. Pass through a membrane filter having a 0.45-µm or finer pore size.

Standard solution B: 40 µg/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer about 125 mg of Powdered *Echinacea angustifolia* (capable of passing through a 40-mesh sieve), accurately weighed, to a round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux, while shaking by mechani-

cal means, for 15 min. Centrifuge, or pass through a membrane filter having a 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the Reference Chromatogram for total phenols provided with the USP Powdered *Echinacea angustifolia* Extract RS.

Resolution: NLT 1.0 between the 1,3-dicaffeoylquinic acid isomer and echinacoside peaks, *Standard solution A*

Capacity factor (k'): NLT 3.0, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caftaric acid (C₁₃H₁₂O₉), chicoric acid (C₂₂H₁₈O₁₂), chlorogenic acid (C₁₆H₁₈O₉), dicaffeoylquinic acids (C₂₅H₂₄O₁₂), and echinacoside (C₃₅H₄₆O₂₀) in the portion of Powdered *Echinacea angustifolia* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak response for the relevant analyte from the *Sample solution*

r_S = peak response for chlorogenic acid from *Standard solution B*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered *Echinacea angustifolia* used to prepare the *Sample solution* (mg)

F = response factor: chicoric acid, 0.695; dicaffeoylquinic acids, 0.729; caftaric acid, 0.881; chlorogenic acid, 1.000; and echinacoside, 2.220

Calculate the percentage of total phenols in the portion of Powdered *Echinacea angustifolia* taken by adding the individual percentages calculated.

Acceptance criteria: NLT 0.5% of total phenols on the dried basis

• CONTENT OF DODECATETRAENOIC ACID ISOBUTYLAMIDES

Standard solution A: Dissolve, with sonication, USP Powdered *Echinacea angustifolia* Extract RS in methanol, shaking for 10 min, and dilute with methanol to obtain a solution having a concentration of 5 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 10 μ g/mL of USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS in methanol

Sample solution: Transfer about 2.5 g of Powdered *Echinacea angustifolia* (capable of passing through a 40-mesh sieve), accurately weighed, into a round-bottom flask. Add 80 mL of methanol, and reflux for 30 min. Cool to room temperature, and filter into a 100-mL volumetric flask, using small portions of methanol to rinse the flask and the filter. Dilute with

methanol to volume. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Mobile phase: Acetonitrile and water (55:45)

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 25 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the Reference Chromatogram for alkamides provided with USP Powdered *Echinacea angustifolia* Extract RS.

Resolution: NLT 1.0 between dodecatetraenoic acid isobutylamide peaks, *Standard solution A*

Tailing factor: NMT 2.0 for the 2*E*,4*E*-hexadienoic acid isobutylamide peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the 2*E*,4*E*-hexadienoic acid isobutylamide peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks due to 2*E*,4*E*,8*Z*,10*E*-dodecatetraenoic acid isobutylamide and 2*E*,4*E*,8*Z*,10*Z*-dodecatetraenoic acid isobutylamide in the chromatogram from the *Sample solution* by comparison with the chromatogram from *Standard solution A*. Measure the areas for the relevant peaks.

Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of Powdered *Echinacea angustifolia* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = sum of the peak responses of the relevant analytes from the *Sample solution*

r_S = peak response of 2*E*,4*E*-hexadienoic acid isobutylamide from the *Standard solution B*

C_S = concentration of USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS in *Standard solution B* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered *Echinacea angustifolia* used to prepare the *Sample solution* (mg)

F = response factor for 2*E*,4*E*-hexadienoic acid isobutylamide, 1.353

Acceptance criteria: NLT 0.075% of dodecatetraenoic acid isobutylamides (C₁₆H₂₅NO) on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* <231>: NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Powdered *Echinacea angustifolia* is a brown powder with a slight aromatic odor and a sweet taste that quickly becomes bitter, leaving a tingling sensation on the tongue. Under a microscope, the following characteristics are observed: thin-walled polygonal cork cells with red-brown contents; lignified reticulate vessels; abundant stone cells of various shapes; fragments of oleoresin canals with reddish-brown contents; and abundant thin-walled parenchyma with spherocrystalline masses of inulin.
- **LOSS ON DRYING** <731>: Dry a sample at 105° for 2 h: it loses NMT 10.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 7.0%

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 4.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.
- **USP REFERENCE STANDARDS (11)**
USP Chlorogenic Acid RS
USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS
USP Powdered *Echinacea angustifolia* Extract RS

Powdered *Echinacea angustifolia* Extract

DEFINITION

Powdered *Echinacea angustifolia* Extract is prepared from *Echinacea angustifolia* roots by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of the starting crude plant material to Powdered Extract is 2:1–8:1. It contains NLT 4.0% and NMT 5.0% of total phenols, calculated on the dried basis as the sum of caftaric acid (C₁₃H₁₂O₉), chicoric acid (C₂₂H₁₈O₁₂), chlorogenic acid (C₁₆H₁₈O₉), dicaffeoylquinic acids (C₂₅H₂₄O₁₂), and echinacoside (C₃₅H₄₆O₂₀). It contains NLT 0.1% of dodecatetraenoic acid isobutylamides (C₁₆H₂₅NO) on the dried basis.

IDENTIFICATION

• A. PRESENCE OF ISOBUTYLALKENYLAMIDES

Standard solution A: Transfer a quantity of USP Powdered *Echinacea angustifolia* Extract RS to a centrifuge tube, and add chloroform to obtain a solution having a known concentration of about 100 mg/mL. Shake by hand to disperse, sonicate for 5 min, and centrifuge. Use the supernatant.

Standard solution B: 1 mg/mL of β -sitosterol in methanol

Sample solution: 100 mg/mL of Powdered Extract in methanol. Allow to stand for 15 min before use.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long μ m (TLC plates)

Application volume: 10 μ L

Developing solvent system: Hexane and ethyl acetate (2:1)

Spray reagent: Prepare a mixture of glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (10:5:0.5) in an ice bath

Analysis

Samples: Standard solution A, Standard solution B, and Sample solution

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Examine the plate under UV light at 254 nm, and then spray the plate with *Spray reagent*, and heat the plate at 100° for 5 min.

Acceptance criteria

Under UV 254 nm: The chromatogram obtained from the *Sample solution* shows one main zone at an *R_f* value of about 0.25 due to 2*E*,4*E*,8*Z*,10*E*-dodecatetraenoic acid isobutylamide and dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide (absent in *E. pallida*) that corresponds in *R_f* value to that in the chromatogram of *Standard solution A*.

After treatment with *Spray reagent*: The chromatogram obtained from the *Sample solution* shows a zone due to β -sitosterol that corresponds in *R_f* value to the principal spot in the chromatogram of *Standard solution B*. Below this spot, there is a zone due to dodeca-2*E*,4*E*,8*Z*,10*E*-tetraenoic acid isobutylamide and to dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide that corresponds in

R_f value to that in the chromatogram of *Standard solution A*; and below this spot, there are several yellowish zones due to α , β -unsaturated isobutylamides (absent in *Echinacea pallida* and mostly violet in *Echinacea purpurea* due to the presence of α , β , γ , δ -unsaturated isobutylamides) that are not visible or are very weak when viewed under UV light at 254 nm.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the echinacoside peak of *Standard solution A*, and the retention time of the peak for 1,3-dicaffeoylquinic acid from the *Sample solution* corresponds to that of *Standard solution A*, all peaks as obtained in the test for *Content of total phenols*.

COMPOSITION

• CONTENT OF TOTAL PHENOLS

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: Dissolve USP Powdered *Echinacea angustifolia* Extract RS in *Solvent*, shaking and heating in a water bath. Dilute with *Solvent* to obtain a solution having a known concentration of 1 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 40 μ g/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer about 60 mg of Powdered Extract, accurately weighed, to an appropriate round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux while shaking by mechanical means for 15 min. Centrifuge, or pass through a membrane filter having a 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μ L

System suitability

Samples: Standard solution A and Standard solution B

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the Reference Chromatogram for total phenols provided with the USP Powdered *Echinacea angustifolia* Extract RS.

Resolution: NLT 1.0 between the 1,3-dicaffeoylquinic acid isomer and echinacoside peaks, *Standard solution A*

Capacity factor (*k'*): NLT 3.0, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: Standard solution A, Standard solution B, and Sample solution

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caftaric acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), chlorogenic acid ($C_{16}H_{18}O_9$), dicaffeoylquinic acids ($C_{25}H_{24}O_{12}$), and echinacoside ($C_{35}H_{46}O_{20}$) in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = peak response for the relevant analyte from the *Sample solution*
 r_S = peak response for chlorogenic acid from *Standard solution B*
 C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)
 C_U = concentration of Powdered *Echinacea angustifolia* Extract in the *Sample solution* (mg/mL)
 F = response factor: chicoric acid, 0.695; dicaffeoylquinic acids, 0.729; caftaric acid, 0.881; chlorogenic acid, 1.000; and echinacoside, 2.220

Calculate the percentage of total phenols in the portion of Powdered Extract taken by adding the individual percentages.

Acceptance criteria: NLT 4.0% and NMT 5.0% of total phenols on the dried basis

• CONTENT OF DODECATETRAENOIC ACID ISOBUTYLAMIDES

Standard solution A: Dissolve USP Powdered *Echinacea angustifolia* Extract RS in methanol, shaking for 1 min, and dilute with methanol to volume to obtain a solution having a known concentration of 1 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 10 μ g/mL of USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS in methanol

Sample solution: Transfer about 500 mg of Powdered Extract, accurately weighed, to a 100-mL volumetric flask. Add 80 mL of methanol, and sonicate for 30 min. Dilute with methanol to volume, and pass through a membrane filter having a 0.45- μ m or finer pore size.

Mobile phase: Acetonitrile and water (55:45)

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 25 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the Reference Chromatogram for alkamides provided with USP Powdered *Echinacea angustifolia* Extract RS.

Resolution: NLT 1.0 between dodecatetraenoic acid isobutylamide peaks, *Standard solution A*

Tailing factor: NMT 2.0 for the 2*E*,4*E*-hexadienoic acid isobutylamide peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the 2*E*,4*E*-hexadienoic acid isobutylamide peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks due to 2*E*,4*E*,8*Z*,10*E*-dodecatetraenoic acid isobutylamide and 2*E*,4*E*,8*Z*,10*Z*-dodecatetraenoic acid isobutylamide in the chromatogram from the *Sample solution* by comparison with the chromatogram

obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = sum of the peak responses of the relevant analytes from the *Sample solution*

 C_U = concentration of Powdered *Echinacea angustifolia* Extract in the *Sample solution* (mg/mL)
 F = response factor for 2*E*,4*E*-hexadienoic acid isobutylamide, 1.353

Acceptance criteria: NLT 0.1% of dodecatetraenoic acid isobutylamides ($C_{16}H_{25}NO$) on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method II* <231>: 20 ppm
- **MICROBIAL ENUMERATION TESTS** <2021>: The total bacterial count does not exceed 10^4 cfu/g and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meets the requirements of the tests for absence of *Salmonella* species, and *Escherichia coli*.
- **OTHER REQUIREMENTS:** It meets the requirements for *Botanical Extracts* <565>, *Residual Solvents* and *Pesticide Residues*.

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry 1 g at 105° for 2 h: it loses NMT 5.0%.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a cool place.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. If standardized by the content of alkamides, label it to indicate the targeted content of dodecatetraenoic acid isobutylamides. The label bears a statement indicating that *Echinacea angustifolia* may cause rare allergic reactions, rashes, or aggravate asthma. It meets the requirements for *Botanical Extracts* <565>, *Labeling*.
- **USP REFERENCE STANDARDS** <11>
 USP Chlorogenic Acid RS
 USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS
 USP Powdered *Echinacea angustifolia* Extract RS

Echinacea pallida

DEFINITION

Echinacea pallida consists of the dried rhizome and roots of *Echinacea pallida* (Nutt.) Nutt. (Fam. Asteraceae). It is harvested in the fall after 3 or more years of growth. It contains NLT 0.5% of total phenols, calculated on the dried basis as the sum of caftaric acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), chlorogenic acid ($C_{16}H_{18}O_9$), and echinacoside ($C_{35}H_{46}O_{20}$).

IDENTIFICATION

- **A. PRESENCE OF ECHINACOSIDE AND ABSENCE OF DICAFFELOYLQUINIC ACIDS (CYNARIN(E))**

Standard solution A: 10 mg/mL of USP Powdered *Echinacea pallida* Extract RS in methanol

Standard solution B: 1 mg/mL of 1,3-dicaffeoylquinic acid in methanol

Sample solution: Weigh and finely pulverize about 10 g of *Echinacea pallida*, and transfer about 1 g of powder, to a suitable extraction thimble. Transfer the thimble to a continuous extraction apparatus, and extract with 50 mL of chloroform for 1 h. Retain the chloroform extract for *Identification* test B. Continue the extraction with 50 mL of methanol, and concentrate to a small volume at 40° in vacuum. With the aid of methanol, transfer the extract to a 10-mL volumetric flask, and dilute with methanol to volume.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 µL

Developing solvent system: Ethyl acetate, formic acid, and water (17:2:1)

Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and then examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram obtained from the *Sample solution* shows a yellowish zone at an R_f value of 0.14, characteristic of echinacoside (absent or traces in *Echinacea purpurea*), corresponding in color and R_f value to that in the chromatogram of *Standard solution A*, and does not show a zone characteristic of 1,3-dicaffeoylquinic acid (present in *Echinacea angustifolia*) corresponding in color and R_f value to that in the chromatogram of *Standard solution B*. Other colored zones of varying intensities may be observed in the chromatogram of the *Sample solution*.

• B. PRESENCE OF KETOALKENYNES

Standard solution A: 10 mg/mL of USP Powdered *Echinacea pallida* Extract RS in chloroform. Shake for 1 min, and centrifuge. Use the supernatant.

Standard solution B: 1 mg/mL of β -sitosterol in methanol

Sample solution: Evaporate to dryness the chloroform extract retained from preparation of the *Sample solution* in *Identification* test A at 40° in vacuum. To the residue add 1 mL of alcohol, and pass through a nylon membrane filter having a pore size of 0.45 µm.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 µL

Developing solvent system: Toluene and ethyl acetate (7:3)

Spray reagent A: 1% solution of vanillin in alcohol

Spray reagent B: 10% solution of sulfuric acid in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and heat the plate at 120° for 3 min.

Acceptance criteria: The chromatogram obtained from the *Sample solution* shows green, brown, and violet zones above the spot for β -sitosterol (R_f range, 0.6–0.8). These zones (unlike those in *Echinacea angustifolia* and *Echinacea purpurea*) are characteristic of ketoalkenyne, and correspond in R_f value to the zones in the chromatogram obtained from *Standard solution A*.

- **C.** The retention time of the major peak in the *Sample solution* corresponds to that of the echinacoside peak in

Standard solution A, as obtained in the test for *Content of Total Phenols*. The peak area of any peak detected at the locus of 1,3-dicaffeoylquinic acid is NMT 1% of the peak area for the echinacoside peak.

COMPOSITION

• CONTENT OF TOTAL PHENOLS

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: Dissolve USP Powdered *Echinacea pallida* Extract RS in *Solvent*, by shaking and heating in a water bath. Dilute with *Solvent* to obtain a solution having a known concentration of 1 mg/mL. Pass through a membrane filter having a 0.45-µm or finer pore size.

Standard solution B: 40 µg/mL of USP Chlorogenic Acid RS in *Solvent*. Pass through a membrane filter having a 0.45-µm or finer pore size.

Sample solution: Transfer 125 mg of finely powdered *Echinacea pallida* (capable of passing through a 40-mesh sieve), to a round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux, while shaking by mechanical means, for 15 min. Centrifuge, or pass through a membrane filter having a 0.45-µm or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained is similar to the Reference Chromatogram for total phenols provided with USP Powdered *Echinacea pallida* Extract RS.

Capacity factor (k'): NLT 3.0 for the chlorogenic acid peak, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caffeic acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), chlorogenic acid ($C_{16}H_{18}O_9$), and echinacoside ($C_{35}H_{46}O_{20}$) in the portion of *Echinacea pallida* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

- r_U = peak response for the relevant analyte from the *Sample solution*
 r_S = peak response for chlorogenic acid from *Standard solution B*
 C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)
 V = volume of the *Sample solution* (mL)
 W = weight of powdered *Echinacea pallida* used to prepare the *Sample solution* (mg)
 F = response factor: chicoric acid, 0.695; caftaric acid, 0.881; chlorogenic acid, 1.000; and echinacoside, 2.220

Calculate the percentage of total phenols in the portion of *Echinacea pallida* taken by adding the individual percentages calculated.

Acceptance criteria: NLT 0.5% of total phenols on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method III (231):** 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis (561):** Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: The outer surface of the rhizome is pale to yellowish-brown, crowned with the remains of the aerial stem, and sometimes shows surface annulations up to 15 mm in diameter. The roots are pale to yellowish-brown, cylindrical or slightly tapering, sometimes spirally twisted, longitudinally wrinkled and deeply furrowed, up to 4–10 mm in diameter, and pass imperceptibly into rhizome. The short fracture, when dry, becomes tough and pliable on exposure to air.

Microscopic: The rhizomes and roots in transverse section show a thin outer bark separated from a wide xylem by a distinct cambial line. The cork is composed of several rows of thin-walled cells containing yellowish-brown pigment. The rhizome has a small circular pith, occasional small groups of thick-walled, lignified fibers in the pericycle, and a parenchymatous cortex. The phloem and xylem are composed of narrow strands of vascular tissue separated by wide, nonlignified medullary rays. Xylem vessels are lignified, 25–75 μm in diameter, usually with reticulate thickening but occasionally with spiral or annular thickening. Sclereids occur singly or in small groups, varying considerably in size and shape from rounded to rectangular to elongated and fiber-like, are up to 300 μm long and 20–40 μm wide, with intercellular spaces forming schizogenous oleoresin canals that are 80–150 μm in diameter and contain a dense black deposit present both inside and outside of the central cylinder (unlike *Echinacea angustifolia*, where the canals are present only outside of the central cylinder). Spherocrystalline masses of inulin occur throughout the parenchymatous tissues. Lignified fibers, present in the periphery of the cortex, are 100–300 μm long and occur singly with phytomelanin often absent (unlike *Echinacea angustifolia*, where the fibers occur scattered in groups, are 300–800 μm long, and are usually surrounded by phytomelanin).

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 4.0%
- **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 10.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS (11)**
 USP Chlorogenic Acid RS
 USP Powdered *Echinacea pallida* Extract RS

Powdered *Echinacea pallida*

DEFINITION

Powdered *Echinacea pallida* is *Echinacea pallida* reduced to a powder or very fine powder.

IDENTIFICATION

• A. PRESENCE OF ECHINACOSIDE AND ABSENCE OF DICAFFELOYLQUINIC ACIDS (CYNARIN(E))

Standard solution A: 10 mg/mL of USP Powdered *Echinacea pallida* Extract RS in methanol

Standard solution B: 1 mg/mL of 1,3-dicaffeoylquinic acid in methanol

Sample solution: Transfer 1 g of Powdered *Echinacea pallida* to a suitable extraction thimble. Transfer the thimble to a continuous extraction apparatus, and extract with 50 mL of chloroform for 1 h. Retain the chloroform extract for *Identification* test B. Continue the extraction with 50 mL of methanol, and concentrate to a small volume at 40° in vacuum. With the aid of methanol, transfer the extract to a 10-mL volumetric flask, and dilute with methanol to volume.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture (TLC plates)

Application volume: 10 μL

Developing solvent system: Ethyl acetate, formic acid, and water (17:2:1)

Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and then examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram obtained from the *Sample solution* shows a yellowish zone at an R_f value of 0.14, characteristic of echinacoside (absent or traces in *Echinacea purpurea*), corresponding in color and R_f value to that in the chromatogram of *Standard solution A*, and does not show a zone characteristic of 1,3-dicaffeoylquinic acid (present in *Echinacea angustifolia*) corresponding in color and R_f value to that in the chromatogram of *Standard solution B*. Other colored zones of varying intensities may be observed in the chromatogram of the *Sample solution*.

• B. PRESENCE OF KETOALKENYNES

Standard solution A: 10 mg/mL of USP Powdered *Echinacea pallida* Extract RS in chloroform. Shake for 1 min, and centrifuge. Use the supernatant.

Standard solution B: 1 mg/mL of β -sitosterol in methanol

Sample solution: Evaporate to dryness the chloroform extract retained from preparation of the *Sample solution* in *Identification* test A at 40° in vacuum. To the residue add 1 mL of alcohol, and pass through a nylon membrane filter having a 0.45- μm pore size.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture (TLC plates)

Application volume: 10 μ L

Developing solvent system: Toluene and ethyl acetate (7:3)

Spray reagent A: 1% solution of vanillin in alcohol

Spray reagent B: 10% solution of sulfuric acid in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and heat the plate at 120° for 3 min.

Acceptance criteria: The chromatogram obtained from the *Sample solution* shows green, brown, and violet zones above the spot for β -sitosterol (R_f range 0.6–0.8). These zones (unlike those in *Echinacea angustifolia* and *Echinacea purpurea*) are characteristic of ketoalkenynes, and correspond in R_f value to the zones in the chromatogram obtained from *Standard solution A*.

- **C.** The retention time of the major peak in the *Sample solution* corresponds to that of the echinacoside peak in the *Standard solution A*, as obtained in the test for *Content of Total Phenols*. The peak area of any peak detected at the locus of 1,3-dicaffeoylquinic acid is NMT 1% of the peak area for the echinacoside peak.

COMPOSITION

• CONTENT OF TOTAL PHENOLS

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: Dissolve USP Powdered *Echinacea pallida* Extract RS in *Solvent*, by shaking and heating in a water bath. Dilute with *Solvent* to obtain a solution having a known concentration of about 1 mg/mL. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 40 μ g/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer 125 mg of Powdered *Echinacea pallida* (capable of passing through a 40-mesh sieve), to a round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux, while shaking by mechanical means, for 15 min. Centrifuge, or pass through a membrane filter having a 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution A* is similar to the Reference Chromatogram for total phenols provided with USP Powdered *Echinacea pallida* Extract RS.

Capacity factor (k'): NLT 3.0 for the chlorogenic acid peak, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caftaric acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), chlorogenic acid ($C_{16}H_{18}O_9$), and echinacoside ($C_{35}H_{46}O_{20}$) in the portion of Powdered *Echinacea pallida* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak response for the relevant analyte from the *Sample solution*

r_S = peak response for chlorogenic acid from *Standard solution B*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Powdered *Echinacea pallida* taken to prepare the *Sample solution* (mg)

F = response factor: chicoric acid, 0.695; caftaric acid, 0.881; chlorogenic acid, 1.000; and echinacoside, 2.220

Calculate the percentage of total phenols in the portion of *Echinacea pallida* taken by adding the individual percentages calculated.

Acceptance criteria: NLT 0.5% of total phenols on the dried basis

CONTAMINANTS

• **HEAVY METALS**, *Method III* (231): 10 ppm

• **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS

• **BOTANICAL CHARACTERISTICS:** Powdered *Echinacea pallida* is a brown powder with a faint aromatic odor and a slightly acid, persistent taste. It turns yellow when mounted in sodium hydroxide solution. Under a microscope, the following characteristics are observed: groups of secretory canals with brown contents, surrounded by parenchymatous cells containing cluster crystals of calcium oxalate; and parenchymatous cells with small starch granules; thick-walled lignified fibers and fragments of reticulate and pitted vessels.

• **ARTICLES OF BOTANICAL ORIGIN**, *Volatile Oil Determination* (561): 1.0–2.0 mL/100 g

• **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 7.0%

• **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* (561): NMT 4.0%

- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 10.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.
- **USP REFERENCE STANDARDS** (11)
 - USP Chlorogenic Acid RS
 - USP Powdered *Echinacea pallida* Extract RS

Powdered *Echinacea pallida* Extract

DEFINITION

Powdered *Echinacea pallida* Extract is prepared from *Echinacea pallida* roots by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of the starting crude plant material to Powdered Extract is between 2:1 and 8:1. It contains NLT 4.0% and NMT 5.0% of total phenols, calculated as the sum of caftaric acid (C₁₃H₁₂O₉), chicoric acid (C₂₂H₁₈O₁₂), chlorogenic acid (C₁₆H₁₈O₉), and echinacoside (C₃₅H₄₆O₂₀), on the dried basis.

IDENTIFICATION

- **A. PRESENCE OF ECHNIACOSIDE AND ABSENCE OF DICAFFELOYLQUINIC ACIDS (CYNARIN(E))**

Standard solution A: 100 mg/mL of USP Powdered *Echinacea pallida* Extract RS in methanol

Standard solution B: 1 mg/mL of 1,3-dicaffeoylquinic acid in methanol

Sample solution: Dissolve 1.0 g of Powdered Extract in 10 mL of methanol. Allow to settle before use.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 µL

Developing solvent system: Ethyl acetate, formic acid, and water (17:2:1)

Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram obtained from the *Sample solution* shows a yellowish zone at an *R_f* value of 0.14 characteristic of echinacoside (absent or only traces present in *Echinacea purpurea*) that corresponds in color and *R_f* value to that in the chromatogram of *Standard solution A*, and does not show a zone characteristic of 1,3-dicaffeoylquinic acid (present in *Echinacea angustifolia*) corresponding in color and *R_f* value to that in the chromatogram of *Standard solution B*. Other colored zones of varying intensities may be observed in the chromatogram of the *Sample solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the echinacoside peak of *Standard solution A*, as obtained in the test for *Content of Total Phenols*.

COMPOSITION

- **CONTENT OF TOTAL PHENOLS**

Solution A: Phosphoric acid (0.1 in 100)

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: Dissolve USP Powdered *Echinacea pallida* Extract RS in *Solvent*, by shaking and heating in a water bath. Dilute with *Solvent* to obtain a solution having a known concentration of 1 mg/mL. Pass through a membrane filter having a 0.45-µm or finer pore size.

Standard solution B: 40 µg/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer about 60 mg of Powdered Extract, accurately weighed, to an appropriate round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux while shaking by mechanical means for 15 min. Centrifuge, or pass through a membrane filter having a 0.45-µm or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

- **USP REFERENCE STANDARDS** (11)
 USP Chlorogenic Acid RS
 USP Powdered *Echinacea pallida* Extract RS

Echinacea purpurea Aerial Parts

DEFINITION

Echinacea purpurea Aerial Parts consists of the aerial parts of *Echinacea purpurea* (L.) Moench (Fam. Asteraceae). It is harvested during the flowering stage. It contains NLT 1.0% of the sum of caftaric acid ($C_{13}H_{12}O_9$) and chicoric acid ($C_{22}H_{18}O_{12}$), and NLT 0.01% of dodecatetraenoic acid isobutylamides ($C_{16}H_{25}NO$), calculated on the dried basis.

IDENTIFICATION

- **A. PRESENCE OF CHICORIC ACID AND ABSENCE OF ECHINACOSIDE**
Standard solution: 10 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in methanol
Sample solution: Add 5 mL of diluted alcohol (7:3) to 0.5 g of the powdered plant material, and shake for 1 min. Centrifuge, and use the supernatant.
Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)
Application volume: 10 μ L
Developing solvent system: Ethyl acetate, formic acid, and water (17:2:1)
Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol
Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
 Develop the chromatograms until the solvent front has moved NLT 18 cm, and dry the plate in a stream of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram from the *Sample solution* shows a yellowish-green zone at an R_f value of 0.75 due to chicoric acid and another yellowish-green zone at an R_f value of 0.45 due to caftaric acid, both zones corresponding in color and R_f value to zones in the chromatogram from the *Standard solution*. The chromatogram from the *Sample solution* does not show or shows only traces of a zone at an R_f value of 0.1 due to echinacoside (present in *Echinacea angustifolia* and in *Echinacea pallida*). Other colored zones of varying intensities may be observed in the chromatogram from the *Sample solution*.

- **B.** The retention times for the relevant peaks of the *Sample solution*, mainly due to caftaric acid and chicoric acid, correspond to those of *Standard solution A*, as obtained in the test for *Content of Chicoric Acid and Caftaric Acid*. A peak for echinacoside is not detected or is very weak (difference with *E. pallida* and *E. angustifolia*).
- **C.** The retention times for the relevant peaks of the *Sample solution*, mainly due to dodecatetraenoic isobutyl amides, correspond to those of *Standard solution A*, as obtained in the test for *Content of Dodecatetraenoic Isobutylamides*.

COMPOSITION

- **CONTENT OF CHICORIC ACID AND CAFTARIC ACID**

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17.5	60	40
18	90	10
30	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: 5 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in *Solvent*. Dissolve by shaking for 1 min, dilute to volume, and filter through a filter of 0.45- μ m or finer pore size.

Standard solution B: 40 μ g/mL of USP Chlorogenic Acid RS in *Solvent*. Dissolve by shaking for 1 min, dilute to volume, and pass through a filter of 0.45- μ m or finer pore size.

Sample solution: Transfer about 125 mg, accurately weighed, of finely powdered *Echinacea purpurea* Aerial Parts (capable of passing through a 40-mesh sieve), to a round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux, while shaking by mechanical means for 15 min. Centrifuge, or pass through a membrane filter of 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the Reference Chromatogram for total phenols provided with USP Powdered *Echinacea purpurea* Extract RS.

Relative standard deviation: NMT 2.0% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentages of caftaric acid (C₁₃H₁₂O₉) and chicoric acid (C₂₂H₁₈O₁₂) in the portion of *Echinacea purpurea* Aerial Parts taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of chlorogenic acid from *Standard solution B*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of *Echinacea purpurea* Aerial Parts taken to prepare the *Sample solution* (mg)

F = response factor: chicoric acid, 0.695; caftaric acid, 0.881; and chlorogenic acid, 1.000

Calculate the percentage of the sum of chicoric acid and caftaric acid in the portion of *Echinacea purpurea* Aerial Parts taken by adding the individual percentages calculated.

Acceptance criteria: NLT 1.0% on the dried basis

• CONTENT OF DODECATETRAENOIC ACID ISOBUTYLAMIDES

Mobile phase: Acetonitrile and water (55:45)

Standard solution A: 5 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in methanol. Dissolve using sonication and shaking for 10 min. After dilution, pass through a membrane filter of 0.45-μm or finer pore size.

Standard solution B: 10 μg/mL of USP 2E,4E-Hexadienoic Acid Isobutylamide RS in methanol

Sample solution: Transfer about 2.5 g of finely powdered *Echinacea purpurea* Aerial Parts (capable of passing through a 40-mesh sieve), accurately weighed, into a round-bottom flask. Add 80 mL of methanol, and reflux for 30 min. Cool to room temperature, and filter into a 100-mL volumetric flask, using small portions of methanol to rinse the flask and the filter. Dilute with methanol to volume. Pass through a membrane filter of 0.45-μm or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the Reference Chromatogram for alkalimides provided with USP Powdered *Echinacea purpurea* Extract RS.

Resolution: NLT 1.0 between dodecatetraenoic acid isobutylamide peaks, *Standard solution A*

Tailing factor: NMT 2.0 for 2E,4E-hexadienoic acid isobutylamide, *Standard solution B*

Relative standard deviation: NMT 2.5% for the 2E, 4E-hexadienoic acid isobutylamide peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks of the two isomers of dodecatetraenoic acid isobutylamides in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of *Echinacea purpurea* Aerial Parts taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = sum of the peak areas of the relevant analytes from the *Sample solution*

r_S = peak area of 2E,4E-hexadienoic acid isobutylamide from *Standard solution B*

C_S = concentration of USP 2E,4E-Hexadienoic Acid Isobutylamide RS in *Standard solution B* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of *Echinacea purpurea* Aerial Parts taken to prepare the *Sample solution* (mg)

F = response factor to convert 2E,4E-hexadienoic acid isobutylamide into dodecatetraenoic acid isobutylamides, 1.353

Acceptance criteria: NLT 0.01% of dodecatetraenoic acid isobutylamides on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticides Residues Analysis* (561): Meet the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the enterobacterial count does not exceed 10³ cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

• BOTANICAL CHARACTERISTICS

Macroscopic: The herb is an erect, coarse, rough-hairy perennial, usually up to 90 cm tall, rarely up to 180 cm. The leaves are alternate and simple; the lowermost leaves are slender, long, and petioled, ovate to broadly lanceolate, mostly penta-nerved, acute or acuminate at the apex, abruptly narrowed or rarely cordate at the base, usually sharply dentate, and 7–20 cm long and 2.5–7.5 cm wide; the petioles are mostly winged at the

summit. The upper leaves are narrower, often almost entirely sessile, lanceolate or ovate lanceolate, and usually with 3 veins.

The flower heads are radiate, up to 15 cm across, solitary or few, and long-peduncled, with 12–20 rays, purple, crimson, or rarely pale; the bristle disks are often orange, 3.5–7.5 cm long; the involucre is depressed-hemispheric; the bracts are lanceolate, spreading or appressed, imbricated in 2–4 series, and hairy on the outer surface with ciliate margins; the receptacle is conical, the scales of the receptacle stiff, spinescent, and conspicuously longer than the disc flowers; the chaff is carinate and cuspidate; the achenes are 3–4 mm in length, tetrasided, obpyramidal, and thick; the pappus has a short, dentate crown.

Microscopic

Leaf: The leaf has a thickness of 200–350 μm , with an epidermis 9–13 μm thick, largely without chloroplasts; the stomata are 28–35 μm , abundant on the ventral surface and fewer on the dorsal surface; the mesophyll is clearly divided into palisade parenchyma and sponge parenchyma. The palisade parenchyma is one layer thick, with elongated cells 50–65 μm in length, oriented at right angles to the leaf surface, containing numerous chloroplasts. The sponge parenchyma is 150–250 μm thick, with cells of irregular shape, and has multiple cell layers, few chloroplasts, and large intercellular spaces. The phloem bundles of the lateral veins within the sponge parenchyma are bound by a one-layer sheath of small parenchymous cells, with vascular elements of the midrib surrounded by large-celled parenchyma. The uniseriate trichomes are few in the ventral surface, numerous on the dorsal surface, typically tricelled, occasionally tetra- or pentacelled, 250–500 μm in length, each arising from an epidermal cell; the epidermal cell walls appear with moderate thickening; the vessels are various, scalariform, with variable reticulated width.

Petiole: The parenchyma appear without chloroplasts, in several layers adjacent to a layer of collenchyma; 5–7 phloem bundles of small- to medium-sized vessels are weakly lignified and embedded in the parenchyma in the form of an arc; the wing ribs of the upper surface of the slightly hollowed petiole are marginal.

Inflorescence: The epidermal cells of the ray florets are square, 50 μm , with a transparent, beaded cell wall; various elements of the *Asteraceae* exhibit inflorescence; numerous multicellular jointed trichomes of the involucre bracts are 500–800 μm in length; tangential sections of the paleae with numerous fiber bundles are 10–15 μm in diameter and 100–150 μm in length; cell walls are thin. The epidermis of ray florets is reddish to violet; the epidermal cells from the end of the corolla form rounded papillae; a stigma of papillary cells is present; *Asteraceae* pollen grains are 20–30 μm and spherical with a warty exine.

Calcium oxalate is negative; crystals of inulin and starch granules are rare.

• USP REFERENCE STANDARDS (11)

- USP Chlorogenic Acid RS
- USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS
- USP Powdered *Echinacea purpurea* Extract RS

Echinacea purpurea Root

DEFINITION

Echinacea purpurea Root consists of the dried rhizome and roots of *Echinacea purpurea* (L.) Moench (Fam. *Asteraceae*). It is harvested in the fall after 3 or more years of growth. It contains NLT 0.5% of total phenols, calculated on the dried basis as the sum of caftaric acid ($\text{C}_{13}\text{H}_{12}\text{O}_9$), chicoric acid ($\text{C}_{22}\text{H}_{18}\text{O}_{12}$), and chlorogenic acid ($\text{C}_{16}\text{H}_{18}\text{O}_9$). It contains NLT 0.025% of alkamides calculated as decatetraenoic acid isobutylamides ($\text{C}_{16}\text{H}_{25}\text{NO}$).

IDENTIFICATION

• A. PRESENCE OF CHICORIC ACID AND ABSENCE OF ECHINACOSIDE

Standard solution A: 20 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in methanol

Standard solution B: 1 mg/mL of 1,3-dicaffeoylquinic acid in methanol

Sample solution: Transfer 1 g of finely pulverized *Echinacea purpurea* Root to a suitable extraction thimble. Transfer the thimble to a continuous extraction apparatus, and extract with 50 mL of chloroform for 1 h. Retain the chloroform extract for *Identification* test B. Continue the extraction with 50 mL of methanol, and concentrate to a small volume at 40° in vacuum. With the aid of methanol, transfer the extract to a 10-mL volumetric flask, and dilute with methanol to volume.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture (TLC plates)

Application volume: 10 μL

Developing solvent system: Ethyl acetate, formic acid, and water (17:2:1)

Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 18 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram from the *Sample solution* shows a yellowish-green zone at an R_f value of 0.75 due to chicoric acid and another yellowish-green zone at an R_f value of 0.45 due to caftaric acid, both zones corresponding in color and R_f value to zones in the chromatogram from *Standard solution A*. The chromatogram from the *Sample solution* does not show or shows only traces of a zone at an R_f value of 0.1 due to echinacoside (present in *Echinacea angustifolia* and in *Echinacea pallida*), and does not show a zone that corresponds in color and R_f value to the spot for 1,3-dicaffeoylquinic acid (cynarin) (present in *Echinacea angustifolia*) in the chromatogram from *Standard solution B*. Other colored zones of varying intensities may be observed in the chromatogram from the *Sample solution*.

• B. PRESENCE OF ISOBUTYLALKENYLAMIDES

Standard solution A: 100 mg/mL USP *Echinacea purpurea* Extract RS in methanol

Standard solution B: 1 mg/mL of β -sitosterol in methanol

Sample solution: Evaporate the chloroform extract retained from preparation of the *Sample solution* in *Identification* test A to dryness at 40° in vacuum. To the residue add 1 mL of alcohol, and pass through a nylon membrane filter of 0.45-μm pore size.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture (TLC plates)

Application volume: 10 μL

Developing solvent system: Hexane and ethyl acetate (2:1)

Spray reagent: Prepare a mixture of glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (10:5:0.5) in an ice bath.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Examine the plate under UV light at 254 nm, and then spray the plate with *Spray reagent*, and heat the plate at 100° for 5 min. Examine the plate under long-wavelength UV light.

Acceptance criteria

Under UV light at 254 nm: The chromatogram from the *Sample solution* shows one main zone corresponding in *R_f* value to the zone due to dodeca-2*E*,4*E*,8*Z*,10*E*-tetraenoic acid isobutylamide and dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide in the chromatogram of *Standard solution A*, and below this zone there are several other zones due to α,β,γ,δ-unsaturated isobutylamides.

After treatment with *Spray reagent* and heating: The zone due to dodeca-2*E*,4*E*,8*Z*,10*E*-tetraenoic acid isobutylamide and dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide turns blue-black, and below this zone there are several other zones due to α,β,γ,δ-unsaturated isobutylamides (not detectable in *Echinacea pallida*) that turn violet (unlike the corresponding zones in the chromatogram of *Echinacea angustifolia* that are mostly yellowish due to α,β-unsaturated isobutylamides). A zone due to β-sitosterol that corresponds in *R_f* value to the principal spot in the chromatogram of *Standard solution B* is also observed.

- **C.** The retention times for the relevant peaks of the *Sample solution*, mainly due to caftaric acid and chicoric acid, correspond to those of *Standard solution A*, as obtained in the test for *Content of Total Phenols*. An echinacoside peak is not detectable or is very weak.

COMPOSITION

• CONTENT OF TOTAL PHENOLS

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17.5	60	40
18	90	10
30	90	10

Solvent: Alcohol and water (7:3)

Standard solution A: 5 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in *Solvent*. Dissolve by shaking for 1 min, dilute with *Solvent* to volume, and pass through a membrane filter of 0.45-μm or finer pore size.

Standard solution B: 40 μg/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer 125 mg of finely powdered *Echinacea purpurea* Root (capable of passing through a 40-mesh sieve) to a round-bottom flask equipped with a condenser. Add 25.0 mL of *Solvent*, and heat under reflux, while shaking by mechanical means for 15 min. Centrifuge, or pass through a membrane filter of 0.45-μm or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution A* is similar to the Reference Chromatogram for total phenols provided with USP Powdered *Echinacea purpurea* Extract RS.

Relative standard deviation: NMT 2% for the chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caftaric acid (C₁₃H₁₂O₉), chicoric acid (C₂₂H₁₈O₁₂), and chlorogenic acid (C₁₆H₁₈O₉) in the portion of *Echinacea purpurea* Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of chlorogenic acid from *Standard solution B*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of *Echinacea purpurea* taken to prepare the *Sample solution* (mg)

F = response factor: chicoric acid, 0.695; caftaric acid, 0.881; and chlorogenic acid, 1.000

Calculate the percentage of total phenols in the portion of *Echinacea purpurea* Root taken by adding the individual percentages calculated.

Acceptance criteria: NLT 0.5% of total phenols on the dried basis

• CONTENT OF ALKAMIDES

Mobile phase: Acetonitrile and water (55:45)

Standard solution A: 5 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in methanol. Dissolve using sonication, and shaking for 10 min. After dilution, pass through a membrane filter having a 0.45-μm or finer pore size.

Standard solution B: 10 μg/mL of USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS in methanol

Sample solution: Transfer about 2.5 g of finely powdered *Echinacea purpurea* Root (capable of passing through a 40-mesh sieve) into a round-bottom flask. Add 80 mL of methanol, and reflux for 30 min. Cool to room temperature, and filter into a 100-mL volumetric flask, using small portions of methanol to rinse the flask and the filter. Dilute with methanol to volume. Pass through a membrane filter having a 0.45-μm or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 25-cm; 5-μm packing L1
Column temperature: 30°
Flow rate: 1.5 mL/min
Injection size: 25 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*
Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the Reference Chromatogram for alkamides provided with USP Powdered *Echinacea purpurea* Extract RS.

Resolution: NLT 1.0 between dodecatetraenoic acid isobutylamide peaks, *Standard solution A*

Tailing factor: NMT 2.0 for the 2*E*,4*E*-hexadienoic acid isobutylamide peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the 2*E*, 4*E*-hexadienoic acid isobutylamide peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks of the 10 major alkamides in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Calculate the percentage of alkamides in the portion of *Echinacea purpurea* Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = sum of the peak areas of the relevant analytes from the *Sample solution*

r_S = peak area of 2*E*,4*E*-hexadienoic acid isobutylamide from *Standard solution B*

C_S = concentration of USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS in *Standard solution B* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of *Echinacea purpurea* root taken to prepare the *Sample solution* (mg)

F = response factor to convert 2*E*,4*E*-hexadienoic acid isobutylamide into dodecatetraenoic acid isobutylamide, 1.353

Acceptance criteria: NLT 0.025% on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residues* (561): Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: The roots are cylindrical and irregularly branched. The outer surface is dark brown and longitudinally striated; fractures are short and tough. Transverse sections show a thin periderm and yellowish xylem with distinct rays. In older roots, the pith is spongy, with a brownish center surrounded by yellow.

Microscopic: Rhizomes and roots in transverse section show a thin outer bark separated from a wide xylem by a brown vascular cambium. The cork is composed of several rows of thin-walled cells containing brown pigment. Schizogenous resin canals are present in the cortex. The rhizome contains bast fibers and stone cells. The xylem, with distinct rays, contains tracheary elements composed of reticulated vessels and tracheids (about 80 × 30 μm) with bordered pits and slanted end walls. Vessels and tracheids are surrounded by thick-walled parenchyma and fibers; fibers are elongated with narrow lumens and funnel-shaped ends (20–40 μm wide). Polygonal sclereids (about 50 μm in diameter) are also present. Xylem fibers have minimal or no

phytomelanin deposits (unlike *Echinacea angustifolia* and *Echinacea pallida*). A melanogenic layer is present between adjacent xylem parenchyma cell walls. The rhizome, with pith, is composed of pitted parenchyma cells containing inulin crystals. Starch is minimal to absent, and calcium oxalate crystals are absent.

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 3.0%
- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 10.0%.

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Under a microscope, the following characteristics are observed: vessels (80 \times 30 μ m) with slanted end walls and spiral or pitted secondary walls; rectangular cork cells (150 \times 60 μ m) with brown inclusions; rectangular parenchymatous cells (120 \times 30 μ m), some pitted; elongated fiber cells having a narrow lumen with funnel-shaped end (20 to 40 μ m wide); polygonal sclereids; a melanogenic layer of variable

thickness, interspersed between the cell walls of the parenchyma; and lignified sclereids, vessels, and fibers. Starch is present; calcium oxalate and inulin crystals are absent.

- **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 10.0%.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 7.0%
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 4.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.
- **USP REFERENCE STANDARDS (11)**
 - USP Chlorogenic Acid RS
 - USP 2*E*,4*E*-Hexadienoic Acid Isobutylamide RS
 - USP Powdered *Echinacea purpurea* Extract RS

Powdered *Echinacea purpurea* Extract

DEFINITION

Powdered *Echinacea purpurea* Extract is prepared from dried *Echinacea purpurea* Root, *Echinacea purpurea* Aerial Parts, or a mixture of them, by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of the starting crude plant material to Powdered Extract is between 2:1 and 8:1. It contains NLT 4.0% of total phenols, calculated as the sum of caffeic acid (C₁₃H₁₂O₉), chicoric acid (C₂₂H₁₈O₁₂), and chlorogenic acid (C₁₆H₁₈O₉), on the dried basis. It contains NLT 0.025% of dodecatetraenoic acid isobutylamides (C₁₆H₂₅NO), calculated on the dried basis.

IDENTIFICATION

A. PRESENCE OF ISOBUTYLALKENYLAMIDES

Standard solution A: 100 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in methanol

Standard solution B: 1 mg/mL of β -sitosterol in methanol

Sample solution: Transfer about 1 g of Powdered *Echinacea purpurea* Extract to a suitable extraction thimble. Transfer the thimble to a continuous extraction apparatus, and extract with 50 mL of chloroform for 1 h.

Evaporate the chloroform extract to dryness at 40° in vacuum. To the residue add 1 mL of alcohol, and pass through a nylon membrane filter of 0.45- μ m pore size.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)

Application volume: 10 μ L

Developing solvent system: Hexane and ethyl acetate (2:1)

Spray reagent: Prepare a mixture of glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (10:5:0.5) in an ice bath.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved NLT 12 cm, and dry the plate in a current of air. Examine the plate under UV light at 254 nm, and then spray the plate with *Spray reagent*, and heat the plate at 100° for 5 min.

Acceptance criteria

Under UV light at 254 nm: The chromatogram from the *Sample solution* shows one main zone corresponding in R_f value to the zone due to dodeca-2*E*,4*E*,8*Z*,10*E*-tetraenoic acid isobutylamide and dodeca-2*E*,4*E*,8*Z*,10*Z*-tetraenoic acid isobutylamide in the chromatogram of *Standard solution A*, and below this zone there are sev-

eral other zones due to $\alpha,\beta,\gamma,\delta$ -unsaturated isobutylamides.

After treatment with *Spray reagent* and heating: The zone due to dodeca-2E,4E,8Z,10E-tetraenoic acid isobutylamide and dodeca-2E,4E,8Z,10Z-tetraenoic acid isobutylamide turns blue-black, and below this zone there are several other zones due to $\alpha,\beta,\gamma,\delta$ -unsaturated isobutylamides (not detectable in *Echinacea pallida*) that turn violet (unlike the corresponding zones in the chromatogram of *Echinacea angustifolia* that are mostly yellowish due to α,β -unsaturated isobutylamides). A zone due to β -sitosterol that corresponds in R_f value to the principal spot in the chromatogram of *Standard solution B* is also observed.

- **B.** The retention times of the peaks for chicoric and caftaric acids of the *Sample solution* correspond to those of *Standard solution A*, as obtained in the test for *Content of Total Phenols*. An echinacoside peak is not detectable or is very weak.

COMPOSITION

• CONTENT OF TOTAL PHENOLS

Solvent: Alcohol and water (7:3)

Standard solution A: 5 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in *Solvent*. Dissolve by shaking for 1 min. After dilution, pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 40 μ g/mL of USP Chlorogenic Acid RS in *Solvent*

Sample solution: Transfer 60 mg of Powdered *Echinacea purpurea* Extract to a round-bottom flask equipped with a condenser. Add 25 mL of *Solvent*, and heat under reflux, while shaking by mechanical means for 15 min. Centrifuge, or pass through a membrane filter of 0.45- μ m or finer pore size.

Solution A: Phosphoric acid (0.1 in 100) in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
13	78	22
14	60	40
17	60	40
17.5	90	10
22	90	10

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 330 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 5 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution A* is similar to the reference chromatogram for total phenols provided with USP Powdered *Echinacea purpurea* Extract RS.

Relative standard deviation: NMT 2% for chlorogenic acid peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the relevant analytes in the chromatogram obtained from the *Sample solution* by comparison with

the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Separately calculate the percentage of caftaric acid ($C_{13}H_{12}O_9$), chicoric acid ($C_{22}H_{18}O_{12}$), and chlorogenic acid ($C_{16}H_{18}O_9$) in the portion of Powdered *Echinacea purpurea* Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response for the relevant analyte from the *Sample solution*

r_S = peak response for chlorogenic acid from *Standard solution B*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution B* (mg/mL)

C_U = concentration of *Echinacea purpurea* in the *Sample solution* (mg/mL)

F = response factor: chicoric acid, 0.695; caftaric acid, 0.881; and chlorogenic acid, 1.000

Calculate the percentage of total phenols in the portion of Powdered *Echinacea purpurea* Extract taken by adding the individual percentages calculated.

Acceptance criteria: NLT 4.0% on the dried basis

• CONTENT OF DODECATETRAENOIC ACID ISOBUTYLAMIDES

Standard solution A: 5 mg/mL of USP Powdered *Echinacea purpurea* Extract RS in methanol. Dissolve using sonication and shaking for 10 min. After dilution, pass through a membrane filter having a 0.45- μ m or finer pore size.

Standard solution B: 10 μ g/mL of USP 2E,4E-Hexadienoic Acid Isobutylamide RS in methanol

Sample solution: Transfer about 500 mg of Powdered *Echinacea purpurea* Extract, accurately weighed, into a 100-mL volumetric flask. Add 80 mL of methanol, and sonicate for 30 min. Cool to room temperature, and dilute with methanol to volume. Pass through a membrane filter of 0.45- μ m or finer pore size.

Mobile phase: Acetonitrile and water (55:45)

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 25 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the reference chromatogram for alkanamides provided with USP Powdered *Echinacea purpurea* Extract RS.

Resolution: NLT 1.0 between dodecatetraenoic acid isobutylamide peaks, *Standard solution A*

Tailing factor: NMT 2.0 for the 2E,4E-hexadienoic acid isobutylamide peak, *Standard solution B*

Relative standard deviation: NMT 2.5% for the 2E, 4E-hexadienoic acid isobutylamide peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks due to 2E,4E,8Z,10E-dodecatetraenoic acid isobutylamide and 2E,4E,8Z,10Z-dodecatetraenoic acid isobutylamide in the chromatogram obtained from the *Sample solution* by comparison with the chromatogram obtained from *Standard solution A*. Measure the areas for the relevant peaks.

Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of Powdered *Echinacea purpurea* Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = sum of the peak responses of the relevant analytes from the *Sample solution*
 r_S = peak response from *Standard solution B*
 C_S = concentration of USP 2E,4E-Hexadienoic Acid Isobutylamide RS in *Standard solution B* (mg/mL)
 C_U = concentration of *Echinacea purpurea* in the *Sample solution* (mg/mL)
 F = response factor to convert 2E,4E-hexadienoic acid isobutylamide into dodecatetraenoic acid isobutylamides, 1.353

Acceptance criteria: NLT 0.025% on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total bacterial count does not exceed 10^4 cfu/g. The total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **BOTANICAL EXTRACTS**, *Residual Solvents* (565): Meets the requirements

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry 1 g at 105° for 2 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a cool place.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant from which the article was prepared. If derived from root and aerial parts, indicate the corresponding percentages. Label it to indicate the content of total phenols and dodecatetraenoic isobutylamides. The label bears a statement indicating that *Echinacea purpurea* may cause rare allergic reactions, rashes, or aggravate asthma. It meets the requirements for *Botanical Extracts* (565), *Labeling*.
- **USP REFERENCE STANDARDS** (11)
 USP Chlorogenic Acid RS
 USP Powdered *Echinacea purpurea* Extract RS
 USP 2E,4E-Hexadienoic Acid Isobutylamide RS

trifuge or filter the solution, and use the supernatant or the filtrate.

Adsorbent: Chromatographic silica gel with an average particle size of 5 μ m (HPTLC plates)

Application volume: 10 μ L, as bands

Developing solvent system: Chloroform, methanol, and water (35:15:2)

Spray reagent: Place 18 mL of methanol in a glass flask, and cool in a water-ice-salt bath or in a freezer. To the ice-cold methanol, slowly and carefully add 2 mL of sulfuric acid, and mix well. Allow the mixture to adjust to room temperature.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Before the development of the chromatogram, saturate the chamber for 20 min with *Developing solvent system*. Record the temperature and humidity in the laboratory. If the relative humidity exceeds 50%, condition the plate to about 30% relative humidity, using a suitable device. Develop the plate over a path of 6 cm, dry, and spray with *Spray reagent*. Heat the plate at 100° for 5 min, and examine under visible light and UV light at 365 nm.

Acceptance criteria: Under visible light, the *Sample solution* exhibits two brown bands due to eleutheroside E and eleutheroside B at R_F values of about 0.34 and 0.45, corresponding in color and R_F to the bands exhibited by *Standard solution A* and *Standard solution B*, respectively. The *Sample solution* also exhibits two additional brown bands near the application zone, corresponding in color and R_F values to the bands exhibited by *Standard solution C*. Other bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. Under UV light, the *Sample solution* shows a brown band due to eleutheroside E corresponding in color and R_F to the band exhibited by *Standard solution A*.

- **B. HPLC:** The chromatogram of the *Sample solution* obtained in the test for *Content of Eleutherosides B and E* shows a peak at a retention time corresponding to that of eleutheroside B in the chromatogram of *Standard solution B* and a peak at a retention time corresponding to that of eleutheroside E in the chromatogram of *Standard solution A*.

COMPOSITION

• CONTENT OF ELEUTHEROSIDES B AND E

Solvent: Methanol and water (1:1)

Solution A: Acetonitrile and water (5:95)

Solution B: Acetonitrile and water (60:40)

Mobile phase: See *Table 1*.

Eleuthero

DEFINITION

Eleuthero is the dried rhizome with roots of *Eleutherococcus senticosus* (Rupr. & Maxim.) Maxim. (Fam. Araliaceae) [*Acanthopanax senticosus* (Rupr. & Maxim.) Harms]. It contains NLT 0.08% of the sum of eleutheroside B and eleutheroside E, calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution A: 1 mg/mL of USP Eleutheroside E RS in methanol

Standard solution B: 1 mg/mL of USP Eleutheroside B RS in methanol

Standard solution C: 0.1 g of USP Powdered Eleuthero Extract RS in 5 mL of aqueous ethanol 50%. Sonicate for 10 min, centrifuge, and use the supernatant.

Sample solution: Transfer about 1 g of finely powdered Eleuthero to a centrifuge tube, add 5 mL of aqueous ethanol 50%, and mix well. Sonicate for 10 min. Cen-

Standard solution A: 0.1 mg/mL of USP Eleutheroside E RS in methanol. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution B: 0.1 mg/mL of USP Eleutheroside B RS in methanol. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution C: 5.0 mg/mL of USP Powdered Eleuthero Extract RS in *Solvent*. Sonicate for 30 min,

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	97	3
5	97	3
30	60	40
31	5	95
45	5	95
45.1	97	3
60	97	3

cool to room temperature, decant, and pass through a nylon filter of 0.45- μ m or finer pore size.

Sample solution: Transfer about 5.0 g of finely ground Eleuthero, accurately weighed, to a round-bottom flask equipped with a condenser. Add 50 mL of *Solvent*, and heat under reflux for 30 min. Filter the supernatant through cotton wool into a 100-mL volumetric flask. Transfer the cotton wool to the round-bottom flask, and repeat the extraction twice, using 22 mL of *Solvent* for each extraction. Filter through cotton wool into the volumetric flask, wash the residue and the cotton wool with *Solvent*, cool to room temperature, dilute with *Solvent* to volume, and mix. Before injection, pass through a nylon filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.0-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Samples: *Standard solution B* and *Standard solution C*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used.

Relative standard deviation: NMT 2.0% determined from the eleutheroside B peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Identify the eleutheroside B and eleutheroside E peaks in the *Sample solution* by comparison with the chromatograms of *Standard solution B* and *Standard solution A*, respectively, and measure the peak responses.

Separately calculate the percentages of eleutheroside B and eleutheroside E in the portion of Eleuthero taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response of the relevant analyte from the *Sample solution*

r_S = peak response of eleutheroside E or eleutheroside B from *Standard solution A* or *Standard solution B*, respectively

C_S = concentration of eleutheroside E or eleutheroside B in *Standard solution A* or *Standard solution B*, respectively (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Eleuthero taken to prepare the *Sample solution* (mg)

Acceptance criteria: Add the percentages of eleutheroside B and eleutheroside E: NLT 0.08% on the dried basis.

CONTAMINANTS

- **HEAVY METALS**, *Method III* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residues* <561>: Meets the requirements
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: The rhizome is knotty and of irregular cylindrical form with a diameter of 15–40 mm. The heartwood area is light brown, and the connecting splint wood is pale yellow. The bark is approximately 2 mm thick and is firmly affixed to the xylem. The surface is gray-brown or black-brown, coarse, and longitudinally vallecule and plicate. A broken rhizome is coarse and fibrous, particularly inside the xylem. The fractured surface of the bark shows short, thin fibers. Numerous roots spring from the underside of the rhizome. These roots are 35–150 mm long, cylindrical, and knotty, with a diameter of 3–15 mm. The surface of the roots is gray-brown to black-brown, is smoother than the rhizome, and has longitudinal stripes. A 0.5-mm thin bark is tightly affixed to the pale yellow xylem. A broken root is sparsely fibrous and appears yellowish-gray where the thin epidermis is flaked off.

Histology: The roots have five to seven rows of brown cork cells. Secretory canals with brown contents appear in groups of four or five and are not more than 20 μ m in diameter. Phloem fibers with thick lignified walls occur singly or in small groups; there are cluster crystals of calcium oxalate in the phloem parenchyma. Parenchymatous cells surround the secretory cells, and medullary ray cells contain small starch granules. The xylem shows reticulately thickened and pitted vessels. The rhizome is similar to the roots except for its larger secretory canals, up to 25 μ m in diameter, and the presence of a pith with parenchymatous cells containing starch granules.

- **LOSS ON DRYING** <731>: Dry a sample at 105° to constant weight: it loses NMT 14.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 8.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Water-Soluble Extractives*, *Method 2* <561>: NLT 4.0%

Powdered Eleuthero

DEFINITION

Powdered Eleuthero is Eleuthero reduced to a powder or very fine powder. It contains NLT 0.08% of the sum of eleutheroside B and eleutheroside E, calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Standard solution A: 1 mg/mL of USP Eleutheroside E RS in methanol

Standard solution B: 1 mg/mL of USP Eleutheroside B RS in methanol

Standard solution C: 0.1 g of USP Powdered Eleuthero Extract RS in 5 mL of aqueous ethanol 50%. Sonicate for 10 min, centrifuge, and use the supernatant.

Sample solution: Transfer about 1 g of Powdered Eleuthero to a centrifuge tube, add 5 mL of aqueous ethanol 50%, and mix well. Sonicate for 10 min. Centrifuge or filter the solution, and use the supernatant or the filtrate.

Adsorbent: Chromatographic silica gel with an average particle size of 5 μ m (HPTLC plates)

Application volume: 10 μ L, as bands

Developing solvent system: Chloroform, methanol, and water (35:15:2)

Spray reagent: Place 18 mL of methanol in a glass flask, and cool in a water-ice-salt bath or in a freezer. To the ice-cold methanol, slowly and carefully add 2 mL of sulfuric acid, and mix well. Allow the mixture to adjust to room temperature.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Before the development of the chromatogram, saturate the chamber for 20 min with *Developing solvent system*. Record the temperature and humidity in the laboratory. If the relative humidity exceeds 50%, condition the plate to about 30% relative humidity, using a suitable device. Develop the plate over a path of 6 cm, dry, and spray with *Spray reagent*. Heat the plate at 100° for 5 min, and examine under visible light and UV light at 365 nm.

Acceptance criteria: Under visible light, the *Sample solution* exhibits two brown bands due to eleutheroside E and eleutheroside B at R_F values of about 0.34 and 0.45, corresponding in color and R_F to the bands exhibited by *Standard solution A* and *Standard solution B*, respectively. The *Sample solution* also exhibits two additional brown bands near the application zone, corresponding in color and R_F values to the bands exhibited by *Standard solution C*. Other bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. Under UV light, the *Sample solution* shows a brown band due to eleutheroside E corresponding in color and R_F to the band exhibited by *Standard solution A*.

- **B. HPLC:** The chromatogram of the *Sample solution* obtained in the test for *Content of Eleutherosides B and E* shows a peak at a retention time corresponding to that of eleutheroside B in the chromatogram of *Standard solution B* and a peak at a retention time corresponding to that of eleutheroside E in the chromatogram of *Standard solution A*.

COMPOSITION

• CONTENT OF ELEUTHEROSIDES B AND E

Solvent: Methanol and water (1:1)

Solution A: Acetonitrile and water (5:95)

Solution B: Acetonitrile and water (60:40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	97	3
5	97	3
30	60	40
31	5	95
45	5	95
45.1	97	3
60	97	3

Standard solution A: 0.1 mg/mL of USP Eleutheroside E RS in methanol. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution B: 0.1 mg/mL of USP Eleutheroside B RS in methanol. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution C: 5.0 mg/mL of USP Powdered Eleuthero Extract RS in *Solvent*. Sonicate for 30 min, cool to room temperature, decant, and pass through a nylon filter of 0.45- μ m or finer pore size.

Sample solution: Transfer 5.0 g of Powdered Eleuthero, accurately weighed, to a round-bottom flask equipped with a condenser. Add 50 mL of *Solvent*, and heat under reflux for 30 min. Filter the supernatant through cotton wool into a 100-mL volumetric flask. Transfer the cotton wool to the round-bottom flask, and repeat the extraction twice, using 22 mL of *Solvent* for each extraction. Filter through cotton wool into the volumetric flask, wash the residue and the cotton wool with *Solvent*, cool to room temperature, dilute with *Solvent* to volume, and mix. Before injection, pass through a nylon filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.0-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Samples: *Standard solution B* and *Standard solution C*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used.

Relative standard deviation: NMT 2.0%, determined from the eleutheroside B peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Identify the eleutheroside B and eleutheroside E peaks in the *Sample solution* by comparison with the chromatograms of *Standard solution B* and *Standard solution A*, respectively, and measure the peak responses.

Separately calculate the percentages of eleutheroside B and eleutheroside E in the portion of Powdered Eleuthero taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response of the relevant analyte from the *Sample solution*

r_S = peak response of eleutheroside E or eleutheroside B from *Standard solution A* or *Standard solution B*, respectively

C_S = concentration of eleutheroside E or eleutheroside B in *Standard solution A* or *Standard solution B*, respectively (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Eleuthero taken to prepare the *Sample solution* (mg)

Acceptance criteria: Add the percentages of eleutheroside B and eleutheroside E: NLT 0.08% on the dried basis.

CONTAMINANTS

• **HEAVY METALS**, *Method III* <231>: NMT 20 ppm

• **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residues* <561>: Meets the requirements

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3

cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.

- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** The powder is brown with a faint aromatic odor and a slightly acid, persistent taste. Groups of secretory canals with brown contents are surrounded by parenchymatous cells containing cluster crystals of calcium oxalate. The parenchymatous cells show small starch granules, thick-walled lignified fibers, and fragments of reticulate and pitted vessels. It turns bright yellow when mounted in sodium hydroxide solution.
- **LOSS ON DRYING (731):** Dry a sample at 105° to constant weight: it loses NMT 14.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 8.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.
- **USP REFERENCE STANDARDS (11)**

Powdered Eleuthero Extract

DEFINITION

Powdered Eleuthero Extract is prepared from Eleuthero using hydroalcoholic mixtures. The ratio of the starting crude plant material to Powdered Extract is between 13:1 and 25:1. It contains NLT 0.8% of eleutherosides B and E, calculated on the anhydrous basis. It may contain added substances.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
 - Standard solution A:** 1 mg/mL of USP Eleutheroside E RS in methanol
 - Standard solution B:** 1 mg/mL of USP Eleutheroside B RS in methanol
 - Standard solution C:** 0.1 g of USP Powdered Eleuthero Extract RS in 5 mL of aqueous ethanol 50%. Sonicate for 10 min, centrifuge, and use the supernatant.
 - Sample solution:** 0.1 g of Powdered Extract in 5 mL of aqueous ethanol 50%. Sonicate for 10 min, centrifuge, and use the supernatant.
 - Adsorbent:** Chromatographic silica gel with an average particle size of 5 μ m (HPTLC plates)
 - Application volume:** 10 μ L, as bands
 - Developing solvent system:** Chloroform, methanol, and water (35:15:2)
 - Spray reagent:** Place 18 mL of methanol in a glass flask, and cool in a water-ice-salt bath or in a freezer. To the ice-cold methanol, slowly and carefully add 2 mL of sulfuric acid, and mix well. Allow the mixture to adjust to room temperature.

Analysis

Samples: Standard solution A, Standard solution B, Standard solution C, and Sample solution
Before the development of the chromatogram, saturate the chamber for 20 min with *Developing solvent system*. Record the temperature and humidity in the laboratory. If the relative humidity exceeds 50%, condition the plate to about 30% relative humidity, using a suitable device. Develop the plate over a path of 6 cm, dry, and spray the plate with *Spray reagent*. Heat the plate at 100° for 5 min, and examine under visible light and UV light at 365 nm.

Acceptance criteria: Under visible light, the *Sample solution* exhibits two brown bands due to eleutheroside E and eleutheroside B at R_F values of about 0.34 and 0.45, corresponding in color and R_F to the bands exhibited by *Standard solution A* and *Standard solution B*, respectively. The *Sample solution* also exhibits two additional brown bands near the application zone, corresponding in color and R_F values to the bands exhibited by *Standard solution C*. Other bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. Under UV light, the *Sample solution* shows a brown band due to eleutheroside E corresponding in color and R_F to the band exhibited by *Standard solution A*.

- **B. HPLC:** The chromatogram of the *Sample solution* obtained in the test for *Content of Eleutherosides B and E* shows a peak at a retention time corresponding to that of eleutheroside B in the chromatogram of *Standard solution B* and a peak at a retention time corresponding to that of eleutheroside E in the chromatogram of *Standard solution A*.

COMPOSITION

• CONTENT OF ELEUTHEROSIDES B AND E

Solvent: Methanol and water (1:1)

Solution A: Acetonitrile and water (5:95)

Solution B: Acetonitrile and water (60:40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	97	3
5	97	3
30	60	40
31	5	95
45	5	95
45.1	97	3
60	97	3

Standard solution A: 0.1 mg/mL of USP Eleutheroside E RS in methanol. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution B: 0.1 mg/mL of USP Eleutheroside B RS in methanol. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution C: 5.0 mg/mL of USP Powdered Eleuthero Extract RS in *Solvent*. Sonicate for 30 min, cool to room temperature, and decant. Before injection, pass through a nylon filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Transfer 500 mg of Powdered Extract to a 100-mL volumetric flask, add 80 mL of *Solvent*, and sonicate for 30 min. Cool to room temperature, dilute with *Solvent* to volume, and mix. Before injection, pass through a nylon filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.0-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution B* and *Standard solution C*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used.

Relative standard deviation: NMT 2.0% determined from the eleutheroside B peak in repeated injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Identify the eleutheroside B and eleutheroside E peaks in the *Sample solution* by comparison with the chromatograms of *Standard solution B* and *Standard solution A*, respectively, and measure the peak responses. Separately calculate the percentages of eleutheroside B and eleutheroside E in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the relevant analyte from the *Sample solution*

r_S = peak response of eleutheroside E or eleutheroside B from *Standard solution A* or *Standard solution B*, respectively

C_S = concentration of eleutheroside E or eleutheroside B in *Standard solution A* or *Standard solution B*, respectively (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 0.8% on the anhydrous basis

CONTAMINANTS

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^4 cfu/g. The total combined yeasts and molds count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method Ia* (921): NMT 5.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 10.0%
- **ALCOHOL DETERMINATION**, *Method II* (611): NMT 0.5%
- **OTHER REQUIREMENTS:** It meets the requirements for *Residual Solvents* and *Pesticide Residues* in *Botanical Extracts* (565).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of eleutherosides, the extracting solvent used for preparation, and the ratio of the starting crude plant material to Powdered Extract. It meets the requirements for *Labeling* in *Botanical Extracts* (565).

Feverfew

DEFINITION

Feverfew consists of the dried leaves of *Tanacetum parthenium* (L.) Sch. Bip. (Fam. Asteraceae), collected when the plant is in flower.

IDENTIFICATION

- A.** The retention time of the parthenolide peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Parthenolide*.

- B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 1.0 mg/mL of USP Parthenolide RS in methanol

Sample solution: Transfer 1.0 g of finely powdered Feverfew to a suitable flask. Add 20 mL of methanol, heat the flask over a water bath at 60° for 15 min, cool, and filter. Evaporate the filtrate under reduced pressure to dryness, and dissolve the residue in 2.0 mL of methanol.

Adsorbent: 0.5-mm layer of chromatographic silica gel, typically 20 cm long

Application volume: 20 µL

Developing solvent system: Toluene and acetone (85:15)

Spray reagent: 0.5% solution of vanillin in a mixture of sulfuric acid and alcohol (4:1)

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatograms until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, mark the solvent front, and allow it to air-dry. Spray the plate with *Spray reagent*. After 5 min, examine the plate in daylight.

Acceptance criteria: A blue spot in the middle portion of the chromatogram of the *Sample solution* that corresponds in color and R_f value to the principal spot obtained in the chromatogram of the *Standard solution* indicates the presence of parthenolide. The lower one-third of the chromatogram of the *Sample solution* may exhibit two pink spots, and the upper one-third may exhibit one pink spot.

- C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.25 mg/mL of USP Rutin RS in methanol

Sample solution: To 1 g of finely powdered Feverfew, add 10 mL of methanol, and heat on a water bath at 60° for 15 min. Cool, and filter.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 20 µL

Developing solvent system: Ethyl acetate, anhydrous formic acid, glacial acetic acid, and water (10:1.1:1.1:2.7)

Spray reagent A: 1% solution of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 5% (w/v) solution of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatogram until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, and allow it to air-dry. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 366 nm.

Acceptance criteria: Relative to the R_f value of the principal spot of the *Standard solution*, the chromatogram of the *Sample solution* exhibits no blue spot at R_f 1.1 (distinction from *Roman chamomile*) but exhibits a green spot at R_f 2.3 (distinction from *Matricaria*), and colored spots at the R_f values indicated are as follows: 1.5 (yellowish orange), 1.65 (yellowish green), 2.0 (greenish blue), and 2.25 (whitish blue).

COMPOSITION

• CONTENT OF PARTHENOLIDE

Mobile phase: Acetonitrile and water (9:11)

Standard solution: 0.04 mg/mL of USP Parthenolide RS in methanol

Sample stock solution: Reduce 100 g of Feverfew to a fine powder. Transfer about 1.0 g of the finely powdered Feverfew, accurately weighed, to a suitable flask. Add 100 mL of methanol, and heat on a water bath at 60° for 10 min. Remove the flask from the water bath, cool, and filter. Rinse the flask with three 5-mL portions of methanol, and filter, adding the rinsings to the filtrate. Transfer the residue left within the filter to the same flask. Add 50 mL of methanol, and continue the rinse procedure as described above. Evaporate the combined filtrates under reduced pressure to dryness, and dissolve the residue in 20.0 mL of methanol.

Sample solution: Transfer 10 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the parthenolide peak

Relative standard deviation: NMT 2.0% for the parthenolide peak in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of parthenolide in the portion of Feverfew taken to prepare the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times [C_S \times (V/W)] \times D \times 100$$

r_U = peak area of the parthenolide peak from the *Sample solution*

r_S = peak area of the parthenolide peak from the *Standard solution*

C_S = concentration of USP Parthenolide RS in the *Standard solution* (mg/mL)

V = final volume of the *Sample stock solution* (mL)

W = weight of powder used to prepare the *Sample stock solution* (mg)

D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*

Acceptance criteria: NLT 0.2% on the dried basis

CONTAMINANTS

- **HEAVY METALS** (231): NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022) It meets the requirements of the tests for the absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Yellowish green, petiolate, usually 2–5 cm in length but sometimes up to 10 cm, ovate, deeply divided into 5 or occasionally 7 segments, each with a coarsely crenate margin and obtuse apex; both surfaces downy and the mid-rib prominent on the lower surface

Histology: Upper and lower epidermal cells with wavy anticlinal walls, striated cuticle and anomocytic stomata, more frequent on the lower epidermis; trichomes, more abundant on the lower epidermis, of two types; covering trichomes uniseriate with up to 6 small isodiametric basal cells and elongated, tapering apical cells, often at right angles to the axis of the basal cells; glandular trichomes slightly sunken, composed of a short, biseriate, 2- or 4-celled stalk and a biseriate head of 4 cells, around which the cuticle forms a bladder-like covering

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** (561): NMT 10.0%, including the stalk
- **ARTICLES OF BOTANICAL ORIGIN, Water-Soluble Extractives, Method 2** (561): NLT 15.0%
- **LOSS ON DRYING** (731): Dry 1.0 g of finely powdered Feverfew at 105° for 1 h: it loses NMT 10.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 12.0%
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** (561): NMT 3.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store in a dry place, protected from light.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11)

Fish Oil Containing Omega-3 Acids

DEFINITION

Fish Oil Containing Omega-3 Acids is the purified, winterized, and deodorized fatty oil obtained from fish of the families Engraulidae, Carangidae, Clupeidae, Osmeridae, Scombroideae, and Ammodytidae. The omega-3 acids are defined as the following: alpha-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), eicosapentaenoic acid (EPA) (C20:5 n-3), heneicosapentaenoic acid (C21:5 n-3), docosapentaenoic acid (C22:5 n-3), and docosahexaenoic acid (DHA) (C22:6 n-3). It contains NLT 28.0% (w/w) of total omega-3 acids, expressed as free acids, consisting of NLT 13.0% of EPA and NLT 9.0% of DHA. Suitable antioxidants in appropriate concentrations may be added.

IDENTIFICATION

- The retention times of the peaks for eicosapentaenoic acid methyl ester and docosahexaenoic acid methyl ester of *Test Solution 2* in the test for *Content of EPA and DHA* correspond to those for the respective compounds of *Standard Solution 1*. The sum of the area for EPA and DHA methyl esters is NLT 22% of the total detected area for the methyl esters, and no other peak has an area higher than 20% of the total detected area for the methyl esters. The chromatogram of *Test Solution 2* exhibits at least 15 additional peaks at the retention times of the methyl esters of unsaturated fatty acids exhibited in *Standard Solution 2*.

COMPOSITION

• CONTENT OF EPA AND DHA

(See *Fats and Fixed Oils* <401>, *Omega-3 Fatty Acids Determination and Profile*.)

Analysis

Samples: *Standard Solution 1*, *Standard Solution 2*, *Test Solution 1*, and *Test Solution 2*

Identify the retention times of the relevant fatty acid methyl esters peaks by comparing the chromatogram of *Standard Solution 2* with the Reference Chromatogram supplied with the USP Fish Oil RS. Identify the retention time for the internal standard peak in the chromatogram of *Test Solution 2* by comparing with that of *Test Solution 1*.

Calculate the percentage of EPA or DHA in the portion of Fish Oil Containing Omega-3 Acids taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times F \times 100$$

R_S = ratio of peak responses of either EPA or DHA relative to the internal standard in the chromatogram of *Standard Solution 2*

W_S = weight of either USP Docosahexaenoic Acid Ethyl Ester RS or USP Eicosapentaenoic Acid Ethyl Ester RS used to prepare *Standard Solution 1* (mg)

W_U = weight of the Fish Oil Containing Omega-3 Acids taken to prepare *Test Solution 2* (mg)

F = factor to express the content of DHA (0.921) and EPA (0.915) as free fatty acids

R_U = ratio of peak response of either EPA or DHA to the corrected peak response of the internal standard in the chromatogram of *Test Solution 2* calculated as follows:

$$R_U = 1/[(r_{U2}/r_{T2}) - (r_{U1}/r_{T1})]$$

r_{U2} = peak response of the peak at the locus of the internal standard in the chromatogram of *Test Solution 2*

r_{T2} = peak response of EPA or DHA in the chromatogram of *Test Solution 2*

- r_{U1} = peak response of any peak at the locus of the internal standard in the chromatogram of *Test Solution 1*
- r_{T1} = peak response of EPA or DHA in the chromatogram of *Test Solution 1*. [NOTE—If no peak is found at the locus of the internal standard in the chromatogram of *Test Solution 1*, $R_U = r_{T2}/r_{U2}$.]

Acceptance criteria: NLT 13.0% (w/w) of EPA and NLT 9.0% (w/w) of DHA

• CONTENT OF TOTAL OMEGA-3 ACIDS

(See *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.)

Analysis: Proceed as directed in the test for *Content of EPA and DHA*, except to calculate the content of the total omega-3 acids:

$$\text{Result} = \text{EPA} + \text{DHA} + [A_{n-3}(\text{EPA} + \text{DHA})]/(A_{\text{EPA}} + A_{\text{DHA}})$$

EPA = content of EPA from the test for *Content of EPA and DHA* [% (w/w)]

DHA = content of DHA from the test for *Content of EPA and DHA* [% (w/w)]

A_{n-3} = sum of the areas of the peaks corresponding to C18:3 n-3, C18:4 n-3, C20:4 n-3, C21:5 n-3, and C22:5 n-3 methyl esters in the chromatogram of *Test Solution 2*

A_{EPA} = area of the peak corresponding to the EPA methyl ester in the chromatogram of *Test Solution 2*

A_{DHA} = area of the peak corresponding to the DHA methyl ester in the chromatogram of *Test Solution 2*

Acceptance criteria: NLT 28.0% (w/w) of total omega-3 acids, expressed as free acids

CONTAMINANTS

• LIMIT OF ARSENIC

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed first through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

1% Palladium stock solution: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

1% Magnesium nitrate stock solution: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution: 1% Palladium stock solution, 1% Magnesium nitrate stock solution, and 2% nitric acid (3:2:5). A volume of 5 μL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (5 in 100)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in the test for *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 $\mu\text{g}/\text{mL}$ of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 $\mu\text{g}/\text{mL}$ of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [CAUTION—Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg of Fish Oil Containing Omega-3 Acids, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115° using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min. Char the sample at 1000° using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min. Cool down and purge the air from the furnace for 10 s using a 20° set temperature and an argon flow of 300 mL/min. Atomize at 2400° using a 0-s ramp and a 5-s hold with the argon flow stopped. Clean out at 2600° using a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 μL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by a 5- μL injection of the *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in $\mu\text{g}/\text{mL}$, and calculate the regression line best fitting the points. Determine the concentration, C , in $\mu\text{g}/\text{mL}$, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Fish Oil Containing Omega-3 Acids taken:

$$\text{Result} = (C/W) \times 25$$

W = weight of Fish Oil Containing Omega-3 Acids taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 $\mu\text{g}/\text{g}$

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N

nitric acid for 30 min and by rinsing with deionized water.]

10% Monobasic ammonium phosphate solution:

10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate solution: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution: 10% Monobasic ammonium phosphate solution, 1% Magnesium nitrate solution, and 2% nitric acid (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (5 in 100)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in the test for *Heavy Metals* (231), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask. Add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120° using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min. Char the sample at 850° using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min. Cool down and purge the air from the furnace for 10 s using a 20° set temperature and an argon flow of 300 mL/min. Atomize at 2100° using a 0-s ramp and a 5-s hold with the argon flow stopped. Clean out at 2600° using a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by a 5-µL injection of *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Fish Oil Containing Omega-3 Acids taken:

$$\text{Result} = (C/W) \times 25$$

W = weight of Fish Oil Containing Omega-3 Acids taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT FOR CADMIUM**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

10% Monobasic ammonium phosphate solution:

10 g of ultrapure monobasic ammonium phosphate in

40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate solution: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution: 10% Monobasic ammonium phosphate solution, 1% Magnesium nitrate solution, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (5 in 100)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate in water

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before make up to final volume dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120° using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min. Char the sample at 850° using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min. Cool down and purge the air from the furnace for 10 s using a 20° set temperature and an argon flow of 300 mL/min. Atomize at 2400° using a 0-s ramp and a 5-s hold with the argon flow stopped. Clean out at 2600° using a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by a 5-µL injection of *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of cadmium in the Fish Oil Containing Omega-3 Acids taken:

$$\text{Result} = (C/W) \times 25$$

W = weight of Fish Oil Containing Omega-3 Acids taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT FOR MERCURY:** Proceed as directed for *Mercury* (261), *Method IIa*, except use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic* combining the 2 duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution*.

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT FOR DIOXINS, FURANS, AND POLYCHLORINATED BIPHENYLS**

Analysis: Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 2.0 pg/g of WHO toxic equivalents. The sum of PCDDs, PCDFs, and dioxin-like PCBs (polychlorinated biphenyls, non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169, and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is NMT 10.0 pg/g of WHO toxic equivalents.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value <401>:** NMT 3
- **FATS AND FIXED OILS, Anisidine Value <401>:** NMT 20.0
- **FATS AND FIXED OILS, Peroxide Value <401>:** NMT 5.0
- **FATS AND FIXED OILS, Total Oxidation Value (TOTOX) <401>:** NMT 26, calculated:

$$\text{Result} = (2 \times \text{PV}) + \text{AV}$$

PV = peroxide value

AV = anisidine value

- **FATS AND FIXED OILS, Unsaponifiable Matter <401>:** NMT 1.5%
- **STEARIN:** 10 mL remains clear after cooling at 0° for 3 h
- **ABSORBANCE**
Sample solution: 0.24 mg/mL in isooctane
Acceptance criteria: The absorbance is NMT 0.70, determined at 233 nm.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature. It may be bottled or otherwise packaged in containers from which air has been expelled by production of a vacuum or by an inert gas.
- **LABELING:** The label states the average content of DHA and EPA in mg/g. It also states the name and concentration of any added antioxidant.
- **USP REFERENCE STANDARDS <11>**
 USP Docosahexaenoic Acid Ethyl Ester RS
 all *cis*-4,7,10,13,16,19-Docosahexaenoic ethyl ester.
 $\text{C}_{24}\text{H}_{36}\text{O}_2$ 356.55
 USP Eicosapentaenoic Acid Ethyl Ester RS
 all *cis*-5,8,11,14,17-Eicosapentaenoic ethyl ester.
 $\text{C}_{22}\text{H}_{34}\text{O}_2$ 330.51
 USP Fish Oil RS
 USP Methyl Tricosanoate RS
 Tricosanoic acid methyl ester.
 $\text{C}_{24}\text{H}_{48}\text{O}_2$ 368.64

Fish Oil Containing Omega-3 Acids Capsules

DEFINITION

Fish Oil Containing Omega-3 Acids Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of Fish Oil Containing Omega-3 Acids where Fish Oil Containing Omega-3 Acids is the purified, winterized, and deodorized fatty oil obtained from fish of the families Engraulidae, Carangidae, Clupeidae, Osmeridae, Scombroidae, and Ammodytidae. The omega-3 acids are defined as the following: alpha-linolenic acid (C18:3 n-3), morotic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), eicosapentaenoic acid (EPA) (C20:5 n-3), heneicosapentaenoic acid (C21:5 n-3), docosapentaenoic acid (C22:5 n-3), and docosahexaenoic acid (DHA) (C22:6 n-3). It contains NLT 28.0% (w/w) of total omega-3 acids, expressed as free acids, consisting of NLT 13.0% of EPA and NLT 9.0% of DHA. Suitable antioxidants in appropriate concentrations may be added.

IDENTIFICATION

- The oil contained in the Capsules meets the requirements for the following test: The retention times of the peaks for eicosapentaenoic acid methyl ester and docosahexaenoic acid methyl ester obtained in the chromatogram of *Test Solution 2* in the test for *Content of EPA and DHA* correspond to those for the respective compounds in the chromatogram of *Standard Solution 1*. The sum of the area for EPA and DHA methyl esters is NLT 22% of the total detected area for the methyl esters, and no other peak in the chromatogram has an area higher than 20% of the total detected area for the methyl esters. The chromatogram of *Test Solution 2* exhibits at least 15 additional peaks at the retention times of the methyl esters of unsaturated fatty acids exhibited in *Standard Solution 2*.

STRENGTH

- **CONTENT OF FISH OIL:** Weigh NLT 10 Capsules in a tared weighing bottle, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of 2,2,4-trimethylpentane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the 2,2,4-trimethylpentane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per Capsule.

Acceptance criteria: NLT 95.0% and NMT 105.0% the labeled amount

• CONTENT OF EPA AND DHA

(See *Fats and Fixed Oils <401>*, *Omega-3 Fatty Acids Determination and Profile*.)

Analysis

Samples: *Standard Solution 1*, *Standard Solution 2*, *Test Solution 1*, and *Test Solution 2*

Identify the retention times of the relevant fatty acid methyl esters peaks by comparing the chromatogram of *Standard Solution 2* with the Reference Chromatogram supplied with the USP Fish Oil RS. Identify the retention time for the internal standard peak in the chromatogram of *Test Solution 2* by comparing with that of *Test Solution 1*.

Calculate the percentage of EPA or DHA in the portion of fish oil containing omega-3 acids taken from the Capsules:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times F \times 100$$

R_S = ratio of peak responses of either EPA or DHA relative to the internal standard in the chromatogram of *Standard Solution 2*

W_S = weight of either USP Docosahexaenoic Acid Ethyl Ester RS or USP Eicosapentaenoic Acid Ethyl Ester RS used to prepare *Standard Solution 1* (mg)

W_U = weight of the fish oil containing omega-3 acids taken to prepare *Test Solution 2* (mg)

F = factor to express the content of DHA (0.921) and EPA (0.915) as free fatty acids

R_U = ratio of peak response of either EPA or DHA to the corrected peak response of the internal standard in the chromatogram of *Test Solution 2* calculated as follows:

$$R_U = 1/[(r_{U2}/r_{T2}) - (r_{U1}/r_{T1})]$$

r_{U2} = response of the peak at the locus of the internal standard in the chromatogram of *Test Solution 2*

r_{T2} = peak response of EPA or DHA in the chromatogram of *Test Solution 2*

- r_{UI} = response of any peak at the locus of the internal standard in the chromatogram of *Test Solution 1*
- r_{TI} = peak response of EPA or DHA in the chromatogram of *Test Solution 1*. [NOTE—If no peak is found at the locus of the internal standard in the chromatogram of *Test Solution 1*, $R_U = r_{T2}/r_{U2}$.]

Acceptance criteria: NLT 13.0% (w/w) of EPA and NLT 9.0% (w/w) of DHA

• CONTENT OF TOTAL OMEGA-3 ACIDS

(See *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.)

Analysis: Proceed as directed in the test for *Content of EPA and DHA*. Calculate the percentage of the total omega-3 acids in the portion of fish oil containing omega-3 acids taken from the Capsules:

$$\text{Result} = \text{EPA} + \text{DHA} + [A_{n-3}(\text{EPA} + \text{DHA})]/(A_{\text{EPA}} + A_{\text{DHA}})$$

- EPA = content of EPA from the test for *Content of EPA and DHA* [% (w/w)]
- DHA = content of DHA from the test for *Content of EPA and DHA* [% (w/w)]
- A_{n-3} = sum of the areas of the peaks corresponding to C18:3 n-3, C18:4 n-3, C20:4 n-3, C21:5 n-3, and C22:5 n-3 methyl esters in the chromatogram of *Test Solution 2*
- A_{EPA} = area of the peak corresponding to the EPA methyl ester in the chromatogram of *Test Solution 2*
- A_{DHA} = area of the peak corresponding to the DHA methyl ester in the chromatogram of *Test Solution 2*

Acceptance criteria: NLT 28.0% (w/w) of total omega-3 acids, expressed as free acids

PERFORMANCE TESTS

- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS (2091):** Meet the requirements
- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS (2040):** Meet the requirements for *Rupture Test for Soft Shell Capsules*

CONTAMINANTS

• LIMIT OF ARSENIC

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has first been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

1% Palladium stock solution: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

1% Magnesium nitrate stock solution: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution: 1% Palladium stock solution, 1% Magnesium nitrate stock solution, and 2% nitric acid (3:2:5). A volume of 5 μL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (5 in 100)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in the test for *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 $\mu\text{g}/\text{mL}$ of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 $\mu\text{g}/\text{mL}$ of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [CAUTION—Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg from content of Capsules, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115° using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min. Char the sample at 1000° using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min. Cool down, and purge the air from the furnace for 10 s using a 20° set temperature and an argon flow of 300 mL/min. Atomize at 2400° using a 0-s ramp and a 5-s hold with the argon flow stopped. Clean out at 2600° using a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 μL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by a 5- μL injection of the *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in $\mu\text{g}/\text{mL}$, and calculate the regression line best fitting the points. Determine the concentration, C , in $\mu\text{g}/\text{mL}$, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

W = weight of fish oil containing omega-3 acids taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has first been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

10% Monobasic ammonium phosphate solution:

10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate solution: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution: 10% Monobasic ammonium phosphate solution, 1% Magnesium nitrate solution, and 2% nitric acid (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (5 in 100)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in the test for *Heavy Metals* (231), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask. Add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120° using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min. Char the sample at 850° using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min. Cool down, and purge the air from the furnace for 10 s using a 20° set temperature and an argon flow of 300 mL/min. Atomize at 2100° using a 0-s ramp and a 5-s hold with the argon flow stopped. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

W = weight of fish oil containing omega-3 acids taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT FOR CADMIUM**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels

before use, use water that has first been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

10% Monobasic ammonium phosphate solution:

10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate solution: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution: 10% Monobasic ammonium phosphate solution, 1% Magnesium nitrate solution, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (5 in 100)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate in water

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before make up to final volume dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120° using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min. Char the sample at 850° using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min. Cool down and purge the air from the furnace for 10 s using a 20° set temperature and an argon flow of 300 mL/min. Atomize at 2400° using a 0-s ramp and a 5-s hold with the argon flow stopped. Clean out at 2600° using a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by a 5-µL injection of *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of cadmium in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

W = weight of fish oil containing omega-3 acids taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF MERCURY:** Proceed as directed for *Mercury* (261), *Method IIa*, except to use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic* combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution*.

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF DIOXINS, FURANS, AND POLYCHLORINATED BIPHENYLS**

Analysis: Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 2.0 pg/g of WHO toxic equivalents. The sum of PCDDs, PCDFs, and dioxin-like PCBs (polychlorinated biphenyls, non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169, and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is NMT 10.0 pg/g of WHO toxic equivalents.

Fish Oil Containing Omega-3 Acids Delayed-Release Capsules

DEFINITION

Fish Oil Containing Omega-3 Acids Delayed-Release Capsules are enteric-coated Capsules that contain NLT 95.0% and NMT 105.0% of the labeled amount of Fish Oil Containing Omega-3 Acids where Fish Oil Containing Omega-3 Acids is the purified, winterized, and deodorized fatty oil obtained from fish of the families Engraulidae, Carangidae, Clupeidae, Osmeridae, Scombroideae, and Ammodytidae. The omega-3 acids are defined as the following: alpha-linolenic acid (C18:3 n-3), morotic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), eicosapentaenoic acid (EPA) (C20:5 n-3), heneicosapentaenoic acid (C21:5 n-3), docosapentaenoic acid (C22:5 n-3),

and docosahexaenoic acid (DHA) (C22:6 n-3). It contains NLT 28.0% (w/w) of total omega-3 acids, expressed as free acids, consisting of NLT 13.0% of EPA and NLT 9.0% of DHA. Suitable antioxidants in appropriate concentrations may be added.

IDENTIFICATION

- **A.** The oil contained in the Capsules meets the requirements for the following test: The retention times of the peaks for eicosapentaenoic acid methyl ester and docosahexaenoic acid methyl ester obtained in the chromatogram of *Test Solution 2* in the test for *Content of EPA and DHA* correspond to those for the respective compounds in the chromatogram of *Standard Solution 1*. The sum of the area for EPA and DHA methyl esters is NLT 22% of the total detected area for the methyl esters, and no other peak has an area higher than 20% of the total detected area for the methyl esters. The chromatogram of *Test Solution 2* exhibits at least 15 additional peaks at the retention times of the methyl esters of unsaturated fatty acids exhibited in *Standard Solution 2*.

STRENGTH

- **CONTENT OF FISH OIL:** Weigh NLT 10 Capsules in a tared weighing bottle, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of 2,2,4-trimethylpentane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the 2,2,4-trimethylpentane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per Capsule.

Acceptance criteria: 95.0%–105.0% of the labeled amount

- **CONTENT OF EPA AND DHA**

(See *Fats and Fixed Oils <401>*, *Omega-3 Fatty Acids Determination and Profile*.)

Analysis

Samples: *Standard Solution 1*, *Standard Solution 2*, *Test Solution 1*, and *Test Solution 2*

Identify the retention times of the relevant fatty acid methyl esters peaks by comparing the chromatogram of *Standard Solution 2* with the reference chromatogram supplied with the USP Fish Oil RS. Identify the retention time for the internal standard peak from *Test Solution 2* by comparing with that of *Test Solution 1*. Calculate the percentage of EPA or DHA in the portion of fish oil containing omega-3 acids taken from the Capsules:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times F \times 100$$

R_S = ratio of peak responses of either EPA or DHA relative to the internal standard from *Standard Solution 2*

W_S = weight of either USP Docosahexaenoic Acid Ethyl Ester RS or USP Eicosapentaenoic Acid Ethyl Ester RS used to prepare *Standard Solution 1* (mg)

W_U = weight of the fish oil containing omega-3 acids taken to prepare *Test Solution 2* (mg)

F = factor to express the content of DHA (0.921) and EPA (0.915) as free fatty acids

R_U = ratio of the peak response of either EPA or DHA to the corrected peak response of the internal standard from *Test Solution 2*, calculated as follows:

$$R_U = 1 / [(r_{U2}/r_{T2}) - (r_{U1}/r_{T1})]$$

r_{U2} = response of the peak at the locus of the internal standard from *Test Solution 2*

r_{T2} = peak response of EPA or DHA from *Test Solution 2*

r_{U1} = response of any peak at the locus of the internal standard from *Test Solution 1*

r_{T1} = peak response of EPA or DHA from *Test Solution 1*. [NOTE—If no peak is found at the locus of the internal standard, $R_U = r_{T2}/r_{U2}$.]

Acceptance criteria: NLT 13.0% (w/w) of EPA and NLT 9.0% (w/w) of DHA

• CONTENT OF TOTAL OMEGA-3 ACIDS

(See *Fats and Fixed Oils* <401>, *Omega-3 Fatty Acids Determination and Profile*.)

Analysis: Proceed as directed in the test for *Content of EPA and DHA*.

Calculate the percentage of the total omega-3 acids in the portion of fish oil containing omega-3 acids taken from the Capsules:

$$\text{Result} = \text{EPA} + \text{DHA} + [A_{n-3}(\text{EPA} + \text{DHA})]/(A_{\text{EPA}} + A_{\text{DHA}})$$

EPA = content of EPA from the test for *Content of EPA and DHA* [% (w/w)]

DHA = content of DHA from the test for *Content of EPA and DHA* [% (w/w)]

A_{n-3} = sum of the areas of the peaks corresponding to C18:3 n-3, C18:4 n-3, C20:4 n-3, C21:5 n-3, and C22:5 n-3 methyl esters from *Test Solution 2*

A_{EPA} = area of the peak corresponding to the EPA methyl ester from *Test Solution 2*

A_{DHA} = area of the peak corresponding to the DHA methyl ester from *Test Solution 2*

Acceptance criteria: NLT 28.0% (w/w) of total omega-3 acids, expressed as free acids

PERFORMANCE TESTS

- **WEIGHT VARIATION** (2091): Meet the requirements
- **DISINTEGRATION AND DISSOLUTION** (2040): Meet the requirements for *Disintegration, Delayed-Release (Enteric-Coated) Soft Shell Capsules*

CONTAMINANTS

- **FATS AND FIXED OILS, Trace Metals** <401>: NMT 0.1 ppm each of Pb, Cd, As, and Hg

- **LIMIT OF DIOXINS, FURANS, AND POLYCHLORINATED BIPHENYLS**

Analysis: Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 2.0 pg/g of WHO toxic equivalents. The sum of PCDDs, PCDFs, and dioxin-like PCBs (polychlorinated biphenyls, non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169, and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is NMT 10.0 pg/g of WHO toxic equivalents.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value** <401>: NMT 3
- **FATS AND FIXED OILS, Anisidine Value** <401>: NMT 20.0
- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 5.0
- **FATS AND FIXED OILS, Total Oxidation Value (TOTOX)** <401>: NMT 26, calculated:

$$\text{Result} = (2 \times \text{PV}) + \text{AV}$$

PV = peroxide value

AV = anisidine value

- **FATS AND FIXED OILS, Unsaponifiable Matter** <401>: NMT 1.5%

- **STEARIN:** 10 mL remains clear after cooling at 0° for 3 h.
- **ABSORBANCE**
Sample solution: 0.24 mg/mL in isooctane
Acceptance criteria: NMT 0.70, determined at 233 nm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature, protected from light.

Folic Acid—see *Folic Acid General Monographs*

Folic Acid Tablets—see *Folic Acid Tablets General Monographs*

Forskohlii

DEFINITION

Forskohlii consists of the dried roots of *Plectranthus barbatus* Andrews, also known as *Coleus barbatus* (Andrews) Benth. and *Coleus forskohlii* Briq. (Fam. Lamiaceae). It contains NLT 0.4% of forskolin, calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Standard solution A: 50 µg/mL of USP Forskolin RS in acetonitrile. Sonicate for about 10 min.

Standard solution B: 5 mg/mL of USP Powdered Forskohlii Extract RS in acetonitrile. Sonicate for about 15 min, centrifuge, and use the supernatant.

Sample stock solution: Use the *Sample solution*, prepared as directed in the test for *Content of Forskolin*.

Sample solution: Dilute 10 mL of the *Sample stock solution* with acetonitrile to 25 mL.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates)

Application volume: 10 µL as 4-mm bands

Developing solvent system: Toluene and ethyl acetate (85:15)

Spray reagent: 5% vanillin in glacial acetic acid and 10% sulfuric acid in water (1:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of

the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, heat for 5–10 min at 105°, and examine under visible light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits the following: a violet zone due to forskolin at an R_f value of approximately 0.3, corresponding in color and R_f to that in the chromatogram of *Standard solution A*; and a minor violet zone, a pink zone, and a brick red zone at R_f values of approximately 0.1, 0.62, and 0.69, due to isoforskolin, 1,9-dideoxyforskolin and crocetindialdehyde, respectively. Zones detected in the *Sample solution* chromatogram correspond in position and color to zones in the chromatogram of *Standard solution B*. Other minor zones may be observed in the *Sample solution* and *Standard solution B* chromatograms.

- **B.** The chromatogram of the *Sample solution* obtained in the test for *Content of Forskolin* shows a main peak at a retention time corresponding to that of forskolin in the chromatogram of *Standard solution A*. Identify other diterpene peaks in the *Sample solution* chromatogram by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS. The *Sample solution* chromatogram shows an additional peak corresponding to isoforskolin.

COMPOSITION

• CONTENT OF FORSKOLIN

Solution A: Use filtered and degassed acetonitrile.

Solution B: Use filtered and degassed water.

Standard solution A: Sonicate a quantity of USP Forskolin RS in acetonitrile to obtain a solution having a known concentration of about 1.0 mg/mL.

Standard solution B: 5 mg/mL of USP Powdered Forskohlii Extract RS in acetonitrile, sonicate for about 15 min, centrifuge, and use the supernatant. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size.

Sample solution: Transfer about 3.0 g of Forskohlii, finely powdered, to a 100-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of acetonitrile, reflux on a water bath for 20 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume with acetonitrile to 100 mL. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first 5 mL of the filtrate.

System suitability solution: *Standard solution A* and 0.01% toluene in acetonitrile (1:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	45	55
25	45	55
28	95	5
35	95	5
36	45	55
45	45	55

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; 5- μ m, 100 Å

Column temperature: 30 \pm 2°

Flow rate: 1.8 mL/min

Injection size: 20 μ L

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *System suitability solution*

[NOTE—The approximate relative retention times for isoforskolin and forskolin are 0.51 and 1.00, respectively.]

Suitability requirements: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used.

Resolution: NLT 1.5 between the forskolin and toluene peaks, *System suitability solution*

Relative standard deviation: NMT 2% determined from the forskolin peak for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS, identify the retention times of the peaks corresponding to isoforskolin and forskolin.

Calculate the percentage of forskolin in the portion of Forskohlii taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of forskolin from the *Sample solution*

r_S = peak response of forskolin from *Standard solution A*

C_S = concentration of USP Forskolin RS in *Standard solution A* (mg/mL)

C_U = concentration of Forskohlii in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 0.4% on the dried basis

IMPURITIES

Inorganic Impurities

• **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* (561): NMT 2%

• **HEAVY METALS**, *Method III* (231): NMT 20 ppm

Organic Impurities

• **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matters* (561): NMT 2.0%

• **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Fresh root, pale pinkish yellow, cylindrical to subcylindrical, with tapering ends, 5–12 in length, 1–2 cm in diameter; surface rough, shows lateral rootlets or scars of rootlets and transversely running lenticels. Pharmacopeial article, dark brown; surface rough, irregularly cylindrical, longitudinally wrinkled, showing irregular grooves and prominent ridges; fracture short; cut surface is yellowish white; characteristic and pleasant aromatic odor, and slightly bitter to pungent taste.

Histology

Transverse section of roots: Irregular circular in outline; showing narrow cork, 10–15 rows of tangentially elongated radially arranged cork cells; cortex composed of 10–15 rows of thin-wall parenchyma cells showing sclereids and crystals of calcium oxalate; vascular cambium in the form of a continuous ring; xylem showing narrow rays of vessels, few lignified fibers are present in older roots, 3–8 cell-wide medullary rays, and parenchyma showing few sclereids, oleoresin canals and simple starch grains; pith composed of parenchyma cells in young roots and is replaced by compactly arranged vessels, fibers, and tracheids in mature roots.

- **LOSS ON DRYING** (731): Dry 1.0 g of finely powdered Forskohlii at 105° for 3 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 6%, determined on 1.0 g of finely powdered Forskohlii
- **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2** (561): NLT 25.0%
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10³ cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*
- **ARTICLES OF BOTANICAL ORIGIN, Test for Aflatoxins** (561): Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11)
USP Forskolin RS
USP Powdered Forskohlii Extract RS

Powdered Forskohlii

DEFINITION

Powdered Forskohlii is Forskohlii reduced to a powder or very fine powder. It contains NLT 0.4% of forskolin, calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution A: 50 µg/mL of USP Forskolin RS in acetonitrile. Sonicate for about 10 min.

Standard solution B: 5 mg/mL of USP Powdered Forskohlii Extract RS in acetonitrile. Sonicate for about 15 min, centrifuge, and use the supernatant.

Sample stock solution: Use the *Sample solution*, prepared as directed in the test for *Content of Forskolin*.

Sample solution: Dilute 10 mL of the *Sample stock solution* with acetonitrile to 25 mL.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates)

Application volume: 10 µL, as 4-mm bands

Developing solvent system: A mixture of toluene and ethyl acetate (85:15)

Spray reagent: A mixture of 5% vanillin in glacial acetic acid and 10% sulfuric acid in water (1:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, heat for 5–10 min at 105°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits a violet zone due to forskolin at an *R_f* value of approximately 0.3, corresponding in color and *R_f* to that from *Standard solution A*; and a minor violet zone, a pink zone, and a brick red zone at *R_f* values of approximately 0.1, 0.62, and 0.69, due to isoforskolin, 1,9-dideoxyforskolin, and crocetindialdehyde, respectively. Zones de-

tected from the *Sample solution* correspond in position and color to zones from *Standard solution B*. Other minor zones may be observed from the *Sample solution* and *Standard solution B*.

- **B.** The *Sample solution* from the test for *Content of Forskolin* shows a main peak at a retention time corresponding to that of forskolin from *Standard solution A*. Identify other diterpene peaks in the *Sample solution* by comparison with *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used. The *Sample solution* shows an additional peak corresponding to isoforskolin.

COMPOSITION

• CONTENT OF FORSKOLIN

Solution A: Use filtered and degassed acetonitrile.

Solution B: Use filtered and degassed water.

Standard solution A: Sonicate a quantity of USP Forskolin RS in acetonitrile to obtain a solution having a known concentration of about 1.0 mg/mL.

Standard solution B: 5 mg/mL of USP Powdered Forskohlii Extract RS in acetonitrile. Sonicate for about 15 min, centrifuge, and use the supernatant. Before injection, pass through a membrane filter having a 0.45-µm or finer pore size.

Sample solution: Transfer about 3.0 g of Powdered Forskohlii to a 100-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of acetonitrile, reflux on a water bath for 20 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume with acetonitrile to 100 mL. Before injection, pass through a membrane filter having a 0.45-µm or finer pore size, discarding the first 5 mL of the filtrate.

System suitability solution: A mixture of *Standard solution A* and 0.01% toluene in acetonitrile (1:1)

Mobile phase: See the gradient table below.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-µm, 100 Å

Column temperature: 30 ± 2°

Flow rate: 1.8 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *System suitability solution*

[NOTE—The relative retention times for isoforskolin and forskolin are 0.51 and 1.00, respectively.]

Suitability requirements: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used.

Relative standard deviation: NMT 2% determined from the forskolin peak in repeated injections, *Standard solution A*

Resolution: NLT 1.5 between the forskolin and toluene peaks, *System suitability solution*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used, identify the retention times of the peaks corresponding to isoforskolin and forskolin. Calculate the percentage of forskolin in the portion of Powdered Forskohlii taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of forskolin from the *Sample solution*
 r_S = peak response of forskolin from *Standard solution A*
 C_S = concentration of USP Forskolin RS in *Standard solution A* (mg/mL)
 C_U = concentration of Powdered Forskohlii in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 0.4% is found on the dried basis.

IMPURITIES

Inorganic Impurities

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** (561): NMT 2%

- **HEAVY METALS, Method III** (231): NMT 20 ppm

Organic Impurities

- **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis** (561): Meets the requirements

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Yellowish brown powder; characteristic and pleasant aromatic odor; and slightly bitter to pungent taste. Under a microscope, it shows the presence of parenchyma cells with oleoresin canals, starch grains and prisms of calcium oxalate; oil globules; simple starch grains, cork cells; sclereids; stone cells; pitted vessels; and thin-wall fibers.
- **LOSS ON DRYING** (731): Dry 1.0 g of Powdered Forskohlii at 105° for 3 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 6%, determined on 1.0 g of Powdered Forskohlii
- **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2** (561): NLT 25.0%
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10^5 cfu/g; the total combined molds and yeasts count does not exceed 10^3 cfu/g; and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*
- **ARTICLES OF BOTANICAL ORIGIN, Test for Aflatoxins** (561): Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11)
 USP Forskolin RS
 USP Powdered Forskohlii Extract RS

Powdered Forskohlii Extract

DEFINITION

Powdered Forskohlii Extract is prepared from Forskohlii using suitable solvents such as methanol, ethyl acetate, hexane

or a mixture of these solvents. The ratio of plant material to extract is between 65:1 and 35:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of forskolin, calculated on the dried basis. It contains suitable added substances as carriers.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution A: 50 µg/mL of USP Forskolin RS in acetonitrile. Sonicate for about 10 min.

Standard solution B: 5 mg/mL of USP Powdered Forskohlii Extract RS in acetonitrile. Sonicate for about 15 min, centrifuge, and use the supernatant.

Sample solution: 5 mg/mL of Powdered Forskohlii Extract in acetonitrile. Sonicate for about 15 min, centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates)

Application volume: 10 µL, as 4-mm bands

Developing solvent system: A mixture of toluene and ethyl acetate (85:15)

Spray reagent: A mixture of 5% vanillin in glacial acetic acid and 10% sulfuric acid in water (1:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, heat for 5–10 min at 105°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits a violet zone due to forskolin at an R_f value of approximately 0.3, corresponding in color and R_f to that from *Standard solution A*; and a minor violet zone, a pink zone, and a brick red zone at R_f values of approximately 0.1, 0.62, and 0.69, due to isoforskolin, 1,9-dideoxyforskolin, and crocetindialdehyde, respectively. Zones detected from the *Sample solution* correspond in position and color to zones from *Standard solution B*. Other minor zones may be observed from the *Sample solution* and *Standard solution B*.

- **B.** The *Sample solution* from the test for *Content of Forskolin* shows a main peak at a retention time corresponding to that of forskolin from *Standard solution A*. Identify other diterpene peaks in the *Sample solution* by comparison with *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used. The *Sample solution* shows an additional peak corresponding to isoforskolin.

COMPOSITION

• CONTENT OF FORSKOLIN

Solution A: Use filtered and degassed acetonitrile.

Solution B: Use filtered and degassed water.

Standard solution A: Sonicate a quantity of USP Forskolin RS in acetonitrile to obtain a solution having a known concentration of about 1.0 mg/mL.

Standard solution B: 5 mg/mL of USP Powdered Forskohlii Extract RS in acetonitrile. Sonicate for about 15 min, centrifuge, and use the supernatant. Before injection, pass through a membrane filter having a 0.45-µm or finer pore size.

Sample solution: Transfer an amount of Powdered Forskohlii Extract equivalent to about 25 mg of forskolin to a 25-mL volumetric flask, and add 15 mL of acetonitrile. Sonicate and heat in a water bath for about 10 min, cool, dilute with acetonitrile to volume, and mix. Before injection, filter through a membrane filter having a 0.45-µm or finer pore size, discarding the first 5 mL of the filtrate.

System suitability solution: A mixture of *Standard solution A* and 0.01% toluene in acetonitrile (1:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	45	55
25	45	55
28	95	5
35	95	5
36	45	55
45	45	55

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm, 100 Å

Column temperature: 30 ± 2°

Flow rate: 1.8 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *System suitability solution*

[NOTE—The relative retention times for isoforskolin and forskolin are 0.51 and 1.00, respectively.]

Suitability requirements: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used.

Relative standard deviation: NMT 2% determined from the forskolin peak in repeated injections, *Standard solution A*

Resolution: NLT 1.5 between the forskolin and toluene peaks, *System suitability solution*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Forskohlii Extract RS being used, identify the retention times of the peaks corresponding to isoforskolin and forskolin.

Calculate the percentage of forskolin in the portion of Powdered Forskohlii Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of forskolin from the *Sample solution*

r_S = peak response of forskolin from *Standard solution A*

C_S = concentration of USP Forskolin RS in *Standard solution A* (mg/mL)

C_U = concentration of Powdered Forskohlii Extract in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 90.0% and NMT 110.0% of the labeled amount of forskolin on the dried basis

IMPURITIES

Inorganic Impurities

• **HEAVY METALS, Method III** <231>: NMT 20 ppm

Organic Impurities

• **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis** <561>: Meets the requirements

SPECIFIC TESTS

• **LOSS ON DRYING** <731>: Dry 1.0 g of Powdered Forskohlii Extract at 105° for 3 h: it loses NMT 5.0% of its weight.

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10⁴ cfu/g. The total combined yeasts and molds count does not exceed 10³ cfu/g.

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

USP Forskolin RS

USP Powdered Forskohlii Extract RS

Garcinia cambogia

DEFINITION

Garcinia cambogia consists of the dried pericarp of the fruits of *Garcinia gummi-gutta* (L.) N. Robson, also known as *Garcinia cambogia* (Gaertn.) Desr. (Fam. Clusiaceae). It contains NLT 12% of the sum of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone, on the dried basis.

IDENTIFICATION

• **A. *Garcinia cambogia*** meets the requirements under *Specific Tests, Botanic Characteristics*.

• **B. HPLC IDENTIFICATION TEST:** The *Sample solution* chromatogram exhibits a peak for hydroxycitric acid at a retention time corresponding to that of *Standard solution A*, as obtained in the test for *Content of (–)-Hydroxycitric Acid and (–)-Hydroxycitric Acid Lactone*. The *Sample solution* also exhibits a peak for hydroxycitric acid lactone. The hydroxycitric acid and the hydroxycitric acid lactone peaks are the main peaks in the *Sample solution* chromatogram.

COMPOSITION

• **CONTENT OF (–)-HYDROXYCITRIC ACID AND (–)-HYDROXYCITRIC ACID LACTONE**

Solution A: 30% phosphoric acid in water

Mobile phase: Dissolve 1.36 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, adjust with *Solution A* to a pH of 2.5, complete to 1000 mL with water, mix, filter, and degas.

Solvent: A mixture of *Solution A* and water (1:9)

Standard solution A: A solution of USP Calcium (–)-Hydroxycitrate RS equivalent to about 2.5 mg/mL of (–)-hydroxycitric acid in *Solvent*. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Standard solution B: 5 mg/mL of USP Powdered *Garcinia Hydroxycitrate* Extract RS in *Solvent*. Before injection, pass through a membrane filter of 0.45-μm or finer pore size.

Sample solution: Transfer about 5 g of *Garcinia cambogia*, finely powdered and accurately weighed, to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of *Solvent*, reflux while stirring on a water bath for 30 min, set aside to settle, and decant the supernatant. Repeat the extraction using four 50-mL portions of water, combine all extracts, cool, filter into a 250-mL volumetric flask, and complete with water to volume. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 215 nm**Column:** 4.6-mm × 25-cm; packing L1**Column temperature:** 25 ± 1°**Flow rate:** 1.0 mL/min**Injection size:** 20 µL**System suitability****Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—The relative retention times for the hydroxycitric acid lactone and hydroxycitric acid peaks are about 0.9 and 1.0, respectively.]

Powdered *Garcinia cambogia*

DEFINITION

Powdered *Garcinia cambogia* is *Garcinia cambogia* reduced to a powder or very fine powder. It contains NLT 12% of the sum of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone, on the dried basis.

IDENTIFICATION

- **A.** Powdered *Garcinia cambogia* meets the requirements under *Specific Tests, Botanic Characteristics*.
- **B. HPLC IDENTIFICATION TEST:** The *Sample solution* chromatogram exhibits a peak for hydroxycitric acid at a retention time corresponding to that of *Standard solution A*, as obtained in the test for *Content of (–)-Hydroxycitric Acid and (–)-Hydroxycitric Acid Lactone*. The *Sample solution* also exhibits a peak for hydroxycitric acid lactone. The hydroxycitric acid and the hydroxycitric acid lactone peaks are the main peaks in the *Sample solution* chromatogram.

COMPOSITION

- **CONTENT OF (–)-HYDROXYCITRIC ACID AND (–)-HYDROXYCITRIC ACID LACTONE**

Solution A: 30% phosphoric acid in water

Mobile phase: Dissolve 1.36 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, adjust with *Solution A* to a pH of 2.5, complete with water to 1000 mL, mix, filter, and degas.

Solvent: *Solution A* and water (1:9)

Standard solution A: A solution of USP Calcium (–)-Hydroxycitrate RS equivalent to about 2.5 mg/mL of (–)-hydroxycitric acid in *Solvent*. Before injection, pass through a membrane filter of 0.45-μm or finer pore size.

Standard solution B: 5 mg/mL of USP Powdered Garcinia Hydroxycitrate Extract RS in *Solvent*. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of filtrate.

Sample solution: Transfer about 5 g of Powdered *Garcinia cambogia*, accurately weighed, to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of *Solvent*, reflux while stirring on a water bath for 30 min, set aside to settle, and decant the supernatant. Repeat the extraction using four 50-mL portions of water, combine all extracts, Cool, filter into a 250-mL volumetric flask, and complete with water to volume. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 25 ± 1°

Flow rate: 1.0 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—The relative retention times for the hydroxycitric acid lactone and hydroxycitric acid peaks are about 0.9 and 1.0, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chro-

matogram provided with the lot of USP Powdered Garcinia Hydroxycitrate Extract RS being used.

Resolution: NLT 1.0 between the hydroxycitric acid lactone and hydroxycitric acid peaks, *Sample solution*

Tailing factor: NMT 2.0 for the hydroxycitric acid peak, *Standard solution A*

Relative standard deviation: NMT 2.0%, determined from the hydroxycitric acid peak for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 6 h.]

Calculate the percentages of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone in the portion of Powdered *Garcinia cambogia* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of hydroxycitric acid from *Standard solution A*

C_S = concentration of (–)-hydroxycitric acid in *Standard solution A* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Powdered *Garcinia cambogia* used to prepare the *Sample solution* (mg)

F = conversion factor for each analyte: 2.17 for (–)-hydroxycitric acid lactone, and 1.00 for (–)-hydroxycitric acid

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of citric acid, using the peak area of citric acid from the *Sample solution* in the test for *Content of (–)-Hydroxycitric Acid and Limit of (–)-Hydroxycitric Acid Lactone*
- r_S = peak area of citric acid from the *Standard solution*
- C_S = concentration of USP Citric Acid RS in the *Standard solution* (mg/mL)
- C_U = concentration of Powdered Garcinia Hydroxycitrate Extract in the *Sample solution* in the test for *Content of (–)-Hydroxycitric Acid and Limit of (–)-Hydroxycitric Acid Lactone* (mg/mL)

Acceptance criteria: NMT 5% of citric acid on the dried basis

- **IDENTIFICATION TESTS—GENERAL** (191): Test for the presence of calcium, magnesium, potassium, and/or sodium.
- **LOSS ON DRYING** (731): Dry 2.0 g of Powdered Extract at 105° for 3 h: Powdered Extract containing calcium hydroxycitrate loses NMT 5.0% of its weight; Powdered Extract containing other salts loses NMT 9.0% of its weight.
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10³ cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **OTHER REQUIREMENTS:** It meets the requirements of the test for *Residual Solvents* under *Botanical Extracts* (565).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. It meets other *Labeling* requirements under *Botanical Extracts* (565).
- **USP REFERENCE STANDARDS** (11)
USP Calcium (–)-Hydroxycitrate RS
USP Citric Acid RS
USP Powdered Garcinia Hydroxycitrate Extract RS

Garcinia indica

DEFINITION

Garcinia indica consists of the dried pericarp of the fruits of *Garcinia indica* (Thouars) Choisy (Fam. Clusiaceae). It contains NLT 12% of the sum of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone, on the dried basis.

IDENTIFICATION

- **A. *Garcinia indica*** meets the requirements under *Specific Tests, Botanic Characteristics*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution: 0.5 mg/mL of garcinol in alcohol
Sample solution: Transfer about 2.0 g of *Garcinia indica*, finely powdered, to a Soxhlet apparatus, add 100 mL of alcohol, and extract for 6 h. Filter and concentrate under vacuum to about 10 mL. [NOTE—Use a thimble of suitable size such that the volume of alcohol used in the Soxhlet extraction is at least twice the volume of the thimble.]
Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)
Application volume: 5 µL, as 8-mm bands
Developing solvent system: Toluene, ethyl acetate, and formic acid (4:1:0.5)

Spray reagent: A mixture of 1% vanillin in alcohol and 10% sulfuric acid in alcohol (1:1)

Analysis

Samples: *Standard solution* and *Sample solution*
Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at about 105°, and examine under visible light.

Acceptance criteria: The *Sample solution* chromatogram exhibits a main greenish-grey band due to garcinol at an R_F value of approximately 0.6, which corresponds in position and color to the main band in the chromatogram of the *Standard solution*. The *Sample solution* exhibits the following additional bands: two purple bands, two greenish-grey bands, two blue bands and a purple band at R_F values of approximately 0.31, 0.34, 0.37, 0.47, 0.54, 0.83, and 0.93, respectively. Other bands may be observed for the *Sample solution*.

- **C. HPLC IDENTIFICATION TEST:** The *Sample solution* chromatogram exhibits a peak for hydroxycitric acid at a retention time corresponding to that of *Standard solution A*, as obtained in the test for *Content of (–)-Hydroxycitric Acid and (–)-Hydroxycitric Acid Lactone*. The *Sample solution* also exhibits a peak for hydroxycitric acid lactone. The hydroxycitric acid and the hydroxycitric acid lactone peaks are the main peaks in the *Sample solution* chromatogram.

COMPOSITION

- **CONTENT OF (–)-HYDROXYCITRIC ACID AND (–)-HYDROXYCITRIC ACID LACTONE**

Solution A: 30% phosphoric acid in water

Mobile phase: Dissolve 1.36 g of anhydrous potassium dihydrogen phosphate in 900 mL of water, adjust with *Solution A* to a pH of 2.5, complete with water to 1000 mL, mix, filter, and degas.

Solvent: A mixture of *Solution A* and water (1:9)

Standard solution A: A solution of USP Calcium (–)-Hydroxycitrate RS equivalent to about 4 mg/mL of (–)-hydroxycitric acid in *Solvent*. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Standard solution B: 8 mg/mL of USP Powdered Garcinia Hydroxycitrate Extract RS in *Solvent*. Before injection, pass through a membrane filter of 0.45-µm or finer pore size.

Sample solution: Transfer about 5 g of *Garcinia indica*, finely powdered and accurately weighed, to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of *Solvent*, reflux while stirring on a water bath for 30 min, set aside to settle, and decant the supernatant. Repeat the extraction using four 50-mL portions of water, combine all extracts, cool, filter into a 250-mL volumetric flask, and complete with water to volume. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 25 ± 1°

Flow rate: 1.0 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—The relative retention times for the hydroxycitric acid lactone and hydroxycitric acid peaks are about 0.9 and 1.0, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered *Garcinia Hydroxycitrate Extract RS* being used.

Resolution: NLT 1.0 between the hydroxycitric acid lactone and hydroxycitric acid peaks, *Sample solution*

Tailing factor: NMT 2.0 for the hydroxycitric acid peak, *Standard solution A*

Relative standard deviation: NMT 2.0%, determined from the hydroxycitric acid peak for replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*. [NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 6 h.] Calculate the percentages of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone in the portion of *Garcinia indica* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of hydroxycitric acid from *Standard solution A*

C_S = concentration of (–)-hydroxycitric acid in *Standard solution A* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of *Garcinia indica* used to prepare the *Sample solution* (mg)

F = conversion factor for each analyte: 2.17 for (–)-hydroxycitric acid lactone, and 1.00 for (–)-hydroxycitric acid

Acceptance criteria: Add the percentages of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone: NLT 12% is found on the dried basis.

IMPURITIES**Inorganic Impurities**

• **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* (561): NMT 0.5%

• **HEAVY METALS**, *Method III* (231): NMT 20 ppm

Organic Impurities

• **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 2.0%

• **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS**• BOTANIC CHARACTERISTICS**

Macroscopic: Fresh fruits are globular in shape, 3–4 cm in diameter, purplish to pinkish orange when ripe, with persistent calyx lobes at the base and flattened radiating sessile stigma at the apex; containing 5–8 seeds surrounded by a succulent aril. Compendial article consists of dried pieces of pericarp, bluish black, of various size and shapes, flattened, flexible; remains of pedicels, calyx, and stigma may be present; odor characteristic; taste sour.

Histology

Transverse section of the pericarp: A layer of epicarp, composed of isodiametric cells, with thin cuticle and stomata; hypodermis consisting of several rows of compactly arranged, tangentially elongated, thick-wall cells, containing dark brown contents, showing narrow irregular elongated cavities; outer mesocarp consisting of loosely arranged, tangentially elongated, parenchyma cells, few are full of starch grains, traversed by narrow bands of collapsed cells and oleoresin ducts; inner mesocarp consisting of collapsed and compactly arranged cells, showing rows of fibrovascular bundles; endocarp is not distinct,

consisting of thin-wall collapsed cells, with dark brown content.

• LIMIT OF CITRIC ACID

Solvent and Chromatographic system: Prepare as directed in the test for *Content of (–)-Hydroxycitric Acid and (–)-Hydroxycitric Acid Lactone*.

Standard solution: 0.5 mg/mL of USP Citric Acid RS in *Solvent*. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Analysis

Sample: *Standard solution*

Calculate the percentage of citric acid in the portion of *Garcinia indica* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area of citric acid from the *Sample solution* in the test for *Content of (–)-Hydroxycitric Acid and (–)-Hydroxycitric Acid Lactone*

r_S = peak area of citric acid from the *Standard solution*

C_S = concentration of USP Citric Acid RS in the *Standard solution* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of *Garcinia indica* used to prepare the *Sample solution* in the test for *Content of (–)-Hydroxycitric Acid and Limit of (–)-Hydroxycitric Acid Lactone* (mg)

Acceptance criteria: NMT 2% of citric acid on the dried basis

• **LOSS ON DRYING** (731): Dry 2.0 g of finely powdered *Garcinia indica* at 105° for 3 h: it loses NMT 12.0% of its weight.

• **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): Determined on 1.0 g of finely powdered *Garcinia indica*: NMT 3.0%; and NMT 8.0% if sodium chloride was added as a preservative during collection of the fruits.

• **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the bile-tolerant Gram-negative bacteria do not exceed 10³ cfu/g.

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella species* and *Escherichia coli*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

• USP REFERENCE STANDARDS (11)

USP Calcium (–)-Hydroxycitrate RS

USP Citric Acid RS

USP Powdered *Garcinia Hydroxycitrate Extract RS*

Powdered *Garcinia indica*

DEFINITION

Powdered *Garcinia indica* is *Garcinia indica* reduced to a fine or very fine powder. It contains NLT 12% of the sum of (–)-hydroxycitric acid and (–)-hydroxycitric acid lactone, on the dried basis.

IDENTIFICATION

• **A.** Powdered *Garcinia indica* meets the requirements under *Specific Tests*, *Botanic Characteristics*.

• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.5 mg/mL of garcinol in alcohol

Sample solution: Transfer about 2.0 g of Powdered *Garcinia indica* to a Soxhlet apparatus, add 100 mL of alcohol, and extract for 6 h. Filter and concentrate under vacuum to about 10 mL. [NOTE—Use a thimble of a suitable size such that the volume of alcohol used in the Soxhlet extraction is at least twice the volume of the thimble.]

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)

Application volume: 5 µL, as 8 mm-bands

Developing solvent system: Toluene, ethyl acetate, and formic acid (4:1:0.5)

Spray reagent: A mixture of 1% vanillin in alcohol and 10% sulfuric acid in alcohol (1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, spray with *Spray reagent*, heat for 5–10 min at about 105°, and examine under visible light.

Acceptance criteria: The *Sample solution* chromatogram exhibits a main greenish-grey band due to garcinol at an R_f value of approximately 0.6, which corresponds in position and color to the main band in the chromatogram of the *Standard solution*. The *Sample solution* exhibits the following additional bands: two purple bands, two greenish-grey bands, two blue bands, and a purple band at R_f values of approximately 0.31, 0.34, 0.37, 0.47, 0.54, 0.83, and 0.93, respectively. Other bands may be observed for the *Sample solution*.

- **C. Garlic

DEFINITION

Garlic consists of the fresh or dried compound bulbs of *Allium sativum* L. (Fam. Liliaceae). It contains NLT 0.5% of alliin and NLT 0.2% of γ -glutamyl-(S)-allyl-L-cysteine, calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution A: 0.5 mg/mL of USP L-Methionine RS in a mixture of methanol and water (1:1)
Standard solution B: 0.5 mg/mL of USP Alliin RS in a mixture of methanol and water (1:1)
Sample solution: Cut a freeze-dried garlic bulb into small pieces, transfer 1 g of the cut pieces to an extractor, and extract with two 20-mL portions of a mixture of methanol and water (1:1), combining the extracts.

Concentrate to a small volume (about 5 mL), using a rotary evaporator.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates).

Application volume: 20 μ L, applied separately as 10-mm bands

Developing solvent system: Butyl alcohol, *n*-propyl alcohol, glacial acetic acid, and water (3:1:1:1)

Spray reagent: 0.2% solution of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (19:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved up about three-fourths of the plate, in a saturated chamber. Remove the plate, and allow the solvent to evaporate. Spray with the *Spray reagent*, heat at 100°–105° for 10 min, and immediately examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* shows the following orange and pinkish violet zones: a violet zone having an R_f value of about 0.89; a pink zone having an R_f value of about 0.5 and corresponding in color and R_f value to that obtained from the chromatogram of *Standard solution A*; a pinkish zone having an R_f value of about 0.43; a strong orange zone having an R_f value of about 0.38; a pinkish violet zone having an R_f value of about 0.3 and corresponding in color and R_f value to that of the chromatogram of *Standard solution B*; and additional pinkish orange zones situated very close to each other just below the zone attributed to alliin in the chromatogram of *Standard solution B*.

- **B. Sample:** About 10 g of garlic bulbs that have been cut into small pieces

Analysis: Transfer the *Sample* to a suitable flask. Add 10 mL of 1 N sodium hydroxide and 10 mL of water, heat the flask in boiling water for 10 min, cool, and filter. Add a few drops of freshly prepared sodium nitroferrocyanide TS to 2 mL of the filtrate.

Acceptance criteria: The appearance of a red or orange-red color indicates the presence of sulfur-containing compounds in the *Sample*.

- **C. The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the test for Content of Alliin.**
- **D. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Extraction column: 1-cm \times 5-cm solid-phase extraction column; contains styrene-divinylbenzene copolymer packing with a 75- to 150- μ m diameter and a 400- to 600-Å pore size. Condition column before use by washing with 50 mL of methanol and with 50 mL of a mixture of methanol and water (3:7). [NOTE—Do not allow the column to dry.]

Standard solution: 0.2 mg/mL each of USP β -Chlorogenin RS and USP Agigenin RS in methanol

Sample solution: Transfer about 10 g of freshly peeled garlic clove to a 37-mL homogenizing cup, and homogenize with 25 mL of methanol at the highest speed for 1 min. Centrifuge the mixture, and decant the supernatant to a flask. Add 70 mL of water. Transfer to the *Extraction column*, allow to drain, and discard the eluate. Wash the column with 50 mL of a mixture of methanol and water (3:7), allow the solvent mixture to drain, and discard the eluate. Finally, elute the crude saponin fraction on the column with 20 mL of methanol, and collect the eluate. Evaporate the solvent to dryness. Dissolve the residue in 4 mL of a mixture of 8% sulfuric acid and alcohol (1:1), transfer the solution to a screw-capped test tube, and heat on a boiling water bath for 5 h. Cool the test tube, add 20 mL of water, and transfer the solution to a freshly conditioned *Extraction column*, allow to drain, and discard the eluate. Wash the column with 30 mL of a mixture of meth-

anol and water (7:3), and discard the eluate. Finally, elute the column with 50 mL of methanol. Collect the eluate, evaporate it to dryness, and dissolve the residue in 0.5 mL of methanol.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates).

Application volume: 20 μ L, as 7-mm bands

Developing solvent system: Methylene chloride and methanol (15:2)

Spray reagent: Dissolve 0.5 mL of 4-methoxybenzaldehyde and 0.5 mL of sulfuric acid in sufficient alcohol to make 10 mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved up about three-fourths of the plate, in a saturated chamber. Remove the plate, and allow the solvent to evaporate. Spray the plate with *Spray reagent*, heat the plate at 100°–105° for 5 min, and examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits, among several yellowish and grayish green spots, a grayish green spot at an R_f value of about 0.4, corresponding to the grayish green spot due to β -chlorogenin of the *Standard solution*. The chromatogram of the *Sample solution* exhibits no spot at an R_f value of about 0.2, corresponding to agigenin of the *Standard solution*.

COMPOSITION

• CONTENT OF ALLIIN

Allinase inhibitor solution: Dissolve 109 mg of carboxymethoxylamine hemihydrochloride in 100.0 mL of water.

Solution A: Monobasic sodium phosphate 0.045 M in water, adjusted with 0.2 M sodium hydroxide to a pH of 7.1

Buffer: Monobasic sodium phosphate 0.05 M in water, adjusted with 0.2 M sodium hydroxide to a pH of 9.5

Derivatization reagent: Dissolve 140 mg of *o*-phthalaldehyde in 5 mL of methanol, add 100 μ L of *t*-butylthiol, and dilute with *Buffer* to 50 mL. [NOTE—This reagent may occasionally become opaque during preparation. Store at room temperature, and use within 1 week.]

Mobile phase: Acetonitrile, 1,4-dioxane, tetrahydrofuran, and *Solution A* (25: 2.9: 2.2: 69.9)

Standard solution: 0.05 mg/mL of USP Alliin RS in a mixture of methanol and water (1:1)

Sample stock solution: Transfer about 10.0 g of freshly peeled garlic cloves, accurately weighed, to a 110-mL homogenizing cup. Add 70.0 mL of *Allinase inhibitor solution*, and blend at the highest speed for 30 s. Centrifuge, and decant the supernatant into a 100-mL volumetric flask. Mix the remaining solids in the cup with 20 mL of *Allinase inhibitor solution*, centrifuge, and add the supernatant to the volumetric flask. Dilute the contents of the flask with *Allinase inhibitor solution* to volume.

Sample solution: Dilute a portion of the *Sample stock solution* 1 in 10 with a mixture of methanol and water (1:1).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 337 nm

Column: 4-mm \times 10-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

[NOTE—Alliin exhibits two major peaks representing its diastereomers.]

Relative standard deviation: NMT 2.0% for each of the major peaks, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Using a syringe, transfer 0.1 mL of the *Standard solution* or *Sample solution* to separate septum-capped vials, and add 0.5 mL of the *Derivatization reagent* to each vial. Allow a reaction time of NLT 2 min before injection into the chromatograph. Record the chromatograms, and measure the areas of the alliin diastereomer peaks. Calculate the percentage of alliin in the portion of Garlic taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times 100$$

r_U = peak area of alliin from the *Sample solution*

r_S = peak areas of alliin diastereomers from the *Standard solution*

C_S = concentration of USP Alliin RS in the *Standard solution* (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Garlic used to prepare the *Sample stock solution* (mg)

D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*, 10

Acceptance criteria: NLT 0.5% on the dried basis

• CONTENT OF γ -GLUTAMYL-(S)-ALLYL-L-CYSTEINE

Solution A: Dissolve 6.80 g of monobasic potassium phosphate in 900 mL of water, and adjust with phosphoric acid to a pH of 2.6. Dilute with water to 1000.0 mL, and mix.

Mobile phase: Methanol and *Solution A* (3:17)

Standard solution: 0.08 mg/mL of USP γ -Glutamyl-(S)-allyl-L-cysteine RS in a mixture of methanol and water (1:1)

Sample solution: Transfer about 10 g of freshly peeled garlic cloves, accurately weighed, to a 110-mL homogenizing cup. Add 80 mL of a mixture of methanol and water (1:1), and homogenize at the highest speed for 1 min. Centrifuge the mixture, and decant the supernatant into a 250-mL volumetric flask. Mix the remaining solids with two 70-mL portions of a mixture of methanol and water (1:1), centrifuge, and transfer the supernatants to the volumetric flask. Dilute the contents of the flask with a mixture of methanol and water (1:1) to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm \times 15-cm; packing L1

Flow rate: 0.8 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for the γ -glutamyl-(S)-allyl-L-cysteine peak in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of γ -glutamyl-(S)-allyl-L-cysteine in the portion of Garlic taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response for γ -glutamyl-(S)-allyl-L-cysteine from the *Sample solution*

r_S = peak response for γ -glutamyl-(S)-allyl-L-cysteine from the *Standard solution*

C_S = concentration of USP γ -Glutamyl-(S)-allyl-L-cysteine RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Garlic used to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.2% on the dried basis

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements

SPECIFIC TESTS

BOTANICAL CHARACTERISTICS

Macroscopic: Subglobular compound bulbs, 3–5 cm in width, consisting of 8–20 cloves, the whole surrounded by 2–5 layers of white scale leaves attached to a flattened, circular base; cloves ovoid and 3- to 4-sided, summit acute, narrowed into a threadlike portion of fiber base, truncate, each clove covered with a white scale leaf and a pinkish white epidermis, easily separated from the solid portion, consisting of two flaky scale leaves and two yellowish green conduplicate foliage leaves

Microscopic: The protective leaf contains an epidermis enclosing a mesophyll free from chlorophyll. The outer epidermis consists of lignified sclereid cells of thick, pitted walls, elongated, covered with thin cuticle, long fibers up to 500 μm in length and 30 μm in width. The cortical cells are thick-walled, nonlignified, tending to collapse on maturity, isodiametric, and contain purple pigments. The vascular bundles consist of lignified spiral and annular vessels. The storage leaves show an outer epidermis of thin, delicate cells of variable shape, arranged in somewhat irregular rows, 60 μm in length and 30 μm in width. Stomata are present on the outer epidermis only at the extreme tip near the base of the foliage leaves.

The mesophyll consists of swollen storage parenchyma cells filled with fine granular reserve material; scattered in the cortex are 20 laticiferous tubes, 500–1000 μm in length. Two series of vascular bundles consisting of narrow lignified spiral and annular vessels are arranged in the mesophyll.

 - USP L-Methionine RS

Powdered Garlic

DEFINITION

Powdered Garlic is produced from Garlic that has been cut, freeze-dried or dried at a temperature not exceeding 65°, and powdered. It contains NLT 0.3% of alliin and NLT 0.1% of γ -glutamyl-(S)-allyl-L-cysteine, calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution A: 0.5 mg/mL of USP L-Methionine RS in a mixture of methanol and water (1:1)

Standard solution B: 0.5 mg/mL of USP Alliin RS in a mixture of methanol and water (1:1)

Sample solution: Transfer 1 g of the Powdered Garlic to an extractor, and extract with two 20-mL portions of a mixture of methanol and water (1:1), combining the extracts. Concentrate to a small volume (about 5 mL), using a rotary evaporator.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 20 μL , applied separately as 10-mm bands

Developing solvent system: Butyl alcohol, *n*-propyl alcohol, glacial acetic acid, and water (3:1:1:1)

Spray reagent: 0.2 in 100 solution of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (19:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved up about three-fourths of the plate, in a saturated chamber. Remove the plate, and allow the solvent to evaporate. Spray with *Spray reagent*, heat at 100°–105° for 10 min, and immediately examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* shows the following orange and pinkish violet zones: a violet zone having an R_f value of about 0.89; a pink zone having an R_f value of about 0.5 and corresponding in color and R_f value to that obtained from the chromatogram of *Standard solution A*; a pinkish zone having an R_f value of about 0.43; a strong orange zone having an R_f value of about 0.38; a pinkish violet zone having an R_f value of about 0.3 and corresponding in color and R_f value to that of the chromatogram of *Standard solution B*; and additional pinkish orange zones situated very close to each other just below the zone attributed to alliin in the chromatogram of *Standard solution B*.

B.

Sample: About 10 g of Powdered Garlic

Analysis: Transfer the *Sample* to a suitable flask. Add 10 mL of 1 N sodium hydroxide and 10 mL of water, heat the flask in boiling water for 10 min, cool, and filter. Add a few drops of freshly prepared sodium nitroferrocyanide TS to 2 mL of the filtrate.

Acceptance criteria: The appearance of a red or orange-red color indicates the presence of sulfur-containing compounds in the *Sample*.

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Alliin*.

D. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Extraction column: 1-cm \times 5-cm solid-phase extraction column; contains styrene-divinylbenzene copolymer packing with a 75- to 150- μm diameter and a 400- to 600-Å pore size. Condition column before use by washing with 50 mL of methanol and with 50 mL of a mixture of methanol and water (3:7). [NOTE—Do not allow the column to dry.]

Standard solution: 0.2 mg/mL each of USP β -Chlorogenin RS and USP Agigenin RS in methanol

Sample solution: Transfer about 10 g of the Powdered Garlic to a 37-mL homogenizing cup, and homogenize with 25 mL of methanol at the highest speed for 1 min. Centrifuge the mixture, and decant the supernatant to a flask. Add 70 mL of water. Transfer to the *Extraction column*, allow to drain, and discard the eluate. Wash the column with 50 mL of a mixture of methanol and water (3:7), allow the solvent mixture to drain, and discard the eluate. Finally, elute the crude saponin fraction on the column with 20 mL of methanol, and collect the eluate. Evaporate the solvent to dryness. Dissolve the residue in 4 mL of a mixture of 8% sulfuric acid and alcohol (1:1), transfer the solution to a screw-capped test tube, and heat on a boiling water bath for 5 h.

Cool the test tube, add 20 mL of water, and transfer the solution to a freshly conditioned *Extraction column*, allow to drain, and discard the eluate. Wash the column with 30 mL of a mixture of methanol and water (7:3), and discard the eluate. Finally, elute the column with 50 mL of methanol. Collect the eluate, evaporate it to dryness, and dissolve the residue in 0.5 mL of methanol.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 20 μ L, as 7-mm bands

Developing solvent system: Methylene chloride and methanol (15:2)

Spray reagent: Dissolve 0.5 mL of 4-methoxybenzaldehyde and 0.5 mL of sulfuric acid in sufficient alcohol to make 10 mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved up about three-fourths of the plate, in a saturated chamber. Remove the plate, and allow the solvent to evaporate. Spray the plate with *Spray reagent*, heat the plate at 100°–105° for 5 min, and examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits, among several yellowish and grayish green spots, a grayish green spot at an R_f value of about 0.4, corresponding to the grayish green spot due to β -chlorogenin of the *Standard solution*. The chromatogram of the *Sample solution* exhibits no spot at an R_f value of about 0.2, corresponding to agigenin of the *Standard solution*.

COMPOSITION

• CONTENT OF ALLIIN

Alliinase inhibitor solution: Dissolve 109 mg of carboxymethoxylamine hemihydrochloride in 100.0 mL of water.

Solution A: 0.045 M monobasic sodium phosphate in water. Adjust with 0.2 M sodium hydroxide to a pH of 7.1.

Buffer: 0.05 M monobasic sodium phosphate in water. Adjust with 0.2 M sodium hydroxide to a pH of 9.5.

Derivatization reagent: Dissolve 140 mg of *o*-phthalaldehyde in 5 mL of methanol, add 100 μ L of *t*-butylthiol, and dilute with *Buffer* to 50 mL. [NOTE—This reagent may occasionally become opaque during preparation. Store at room temperature, and use within 1 week.]

Mobile phase: Acetonitrile, 1,4-dioxane, tetrahydrofuran, and *Solution A* (25: 2.9: 2.2: 69.9)

Standard solution: 0.05 mg/mL of USP Alliin RS in a mixture of methanol and water (1:1)

Sample stock solution: Transfer about 1.0 g of Powdered Garlic, accurately weighed, to a flask. Add 30.0 mL of *Alliinase inhibitor solution*, and shake vigorously until the powder is fully dispersed. Centrifuge to obtain a clear solution.

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a 10-mL volumetric flask, and dilute with *Alliinase inhibitor solution* to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 337 nm

Column: 4-mm \times 10-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

[NOTE—Alliin exhibits two major peaks representing its diastereomers.]

Relative standard deviation: NMT 2.0% for each of the major peaks, in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Using a syringe, transfer 0.1 mL of the *Standard solution* or the *Sample solution* to separate septum-capped vials, add 0.5 mL of the *Derivatization reagent* to each vial, and mix. Allow a reaction time of NLT 2 min before injection into the chromatograph. Record the chromatograms, and measure the areas of the alliin diastereomer peaks.

Calculate the percentage of alliin in the portion of Powdered Garlic taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times 100$$

r_U = peak area of alliin from the *Sample solution*

r_S = sum of the peak areas of alliin diastereomers from the *Standard solution*

C_S = concentration of USP Alliin RS in the *Standard solution* (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Powdered Garlic used to prepare the *Sample stock solution* (mg)

D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*, 2

Acceptance criteria: NLT 0.3% on the dried basis

• CONTENT OF γ -GLUTAMYL-(S)-ALLYL-L-CYSTEINE

Solution A: Dissolve 6.80 g of monobasic potassium phosphate in 900 mL of water, and adjust with phosphoric acid to a pH of 2.6. Dilute with water to 1000.0 mL, and mix.

Mobile phase: Methanol and *Solution A* (3:17)

Standard solution: 0.08 mg/mL of USP γ -Glutamyl-(S)-allyl-L-cysteine RS in a mixture of methanol and water (1:1)

Sample solution: Transfer about 1.0 g of Powdered Garlic, accurately weighed, to a 50-mL volumetric flask. Add 30 mL of methanol and water (1:1), and shake vigorously until the powder is fully dispersed. Dilute the contents of the flask with a mixture of methanol and water (1:1) to volume. Centrifuge to obtain a clear solution.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm \times 15-cm; packing L1

Flow rate: 0.8 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for the γ -glutamyl-(S)-allyl-L-cysteine peak in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of γ -glutamyl-(S)-allyl-L-cysteine in the portion of Powdered Garlic taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response for γ -glutamyl-(S)-allyl-L-cysteine from the *Sample solution*

r_S = peak response for γ -glutamyl-(S)-allyl-L-cysteine from the *Standard solution*

C_S = concentration of USP γ -Glutamyl-(S)-allyl-L-cysteine RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Garlic used to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.1% on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method I (231):** NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Under a microscope, Powdered Garlic shows the following diagnostic characteristics: numerous fragments of parenchyma with large cells containing crystals of calcium oxalate and small triangular or quadrangular intercellular spaces at the corners; spiral vessels accompanied by subquadratic cells; elongated epidermal cells with thick, pitted walls.
- **ABSENCE OF STARCH:** A water slurry of Powdered Garlic shows no blue color when iodine TS is added.
- **LOSS ON DRYING (731):** Dry 1 g of it at 105° for 2 h: it loses NMT 7.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 5.0%

Powdered Garlic Extract

DEFINITION

Powdered Garlic Extract is prepared from fresh Garlic bulbs by extraction with alcohol. The ratio of the starting crude plant material to Powdered Extract is 9.5:1–13.5:1. It contains NLT 4.0% of alliin ($C_6H_{11}NO_3S$). It may contain added Powdered Garlic or other suitable substances.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
 - Standard solution A:** 0.5 mg/mL of USP L-Methionine RS in a mixture of methanol and water (1:1)
 - Standard solution B:** 0.5 mg/mL of USP Alliin RS in a mixture of methanol and water (1:1)
 - Sample solution:** Transfer a quantity of Powdered Extract, equivalent to about 5 mg of alliin, to a suitable container. Add 40 mL of a mixture of methanol and water (1:1), and shake until the powder is fully dispersed. Centrifuge, and decant the supernatant into a round-bottomed flask. Concentrate to a small volume (about 5 mL) using a rotary evaporator.
 - Adsorbent:** 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates).
 - Application volume:** 20 μ L, applied separately as 10-mm bands
 - Developing solvent system:** Butyl alcohol, *n*-propyl alcohol, glacial acetic acid, and water (3:1:1:1)
 - Spray reagent:** 0.2% solution of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (19:1)
 - Analysis**
 - Samples:** *Standard solutions* and *Sample solution*
- Develop the chromatograms until the solvent front has moved up about three-fourths of the plate, in a saturated chamber. Remove the plate, and allow the sol-

vent to evaporate. Spray with the *Spray reagent*, heat at 100°–105° for 10 min, and immediately examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* shows the following orange and pinkish violet zones: a violet zone having an R_f value of about 0.89; a pink zone having an R_f value of about 0.5 and corresponding in color and R_f value to that of the chromatogram of *Standard solution A*; a pinkish zone having an R_f value of about 0.43; a strong orange zone having an R_f value of about 0.38; a pinkish violet zone having an R_f value of about 0.3 and corresponding in color and R_f value to that of the chromatogram of *Standard solution B*; and additional pinkish orange zones situated very close to each other just below the zone attributed to alliin in the chromatogram of *Standard solution B*.

- **B.** The retention time of the alliin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Alliin*.

COMPOSITION

• CONTENT OF ALLIIN

Allinase inhibitor solution: 1.09 mg/mL of carboxymethoxylamine hemihydrochloride

Garlic Fluidextract

DEFINITION

Garlic Fluidextract is prepared as follows. Soak 1000 g of Garlic, whole or sliced, in a volume of a mixture of water and alcohol (between 80:20 and 50:50) sufficient to cover the cloves. Store in a suitable container for a length of time sufficient to extract the constituents, avoiding any contamination, and then filter. Concentrate the filtrate, if necessary, at the lowest possible temperature, and add sufficient water or alcohol to make the product measure 1000 mL. [NOTE—Complete extraction may require 30 days.]

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Extraction column: Use a solid-phase extraction column that contains benzenesulfonylpropyl bonded to silica gel in the hydrogen form having a sorbent mass-to-column volume ratio of 1 g per 6 mL, or equivalent. Condition the column before use by washing with 10 mL of methanol and 10 mL of water. [NOTE—Do not allow the column to dry.]

Standard solution: 0.5 mg/mL of USP S-Allyl-L-cysteine RS in a mixture of methanol and water (1:1)

Sample solution: Mix 1 mL of Fluidextract and 5 mL of water, and transfer to the *Extraction column*. Allow to drain, and discard the eluate. Wash the column with 10 mL of water and 10 mL of methanol, discarding the eluates. Elute the amino acid fraction with 3 mL of ammonium hydroxide solution in methanol (7 in 100), and collect the eluate.

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 5 μ L

Developing solvent system: Ethyl acetate, methanol, acetone, glacial acetic acid, and water (10:4:3:1:3)

Spray reagent: Iodoplatinate TS

Analysis

Samples: *Standard solution* and *Sample solution*
 Develop the chromatograms until the solvent front has moved up about three-fourths of the plate, in a saturated chamber. Remove the plate, and allow the solvent to evaporate. Spray with the *Spray reagent*, and examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits, among several yellow spots on the purple plate, a yellow spot at an R_f value of about 0.4 corresponding to that of the yellow spot obtained in the chromatogram of the *Standard solution* (presence of S-allyl-L-cysteine).

COMPOSITION

• CONTENT OF S-ALLYL-L-CYSTEINE

Mobile phase: Transfer 15.8 g of sodium citrate dihydrate to 250 mL of water, and carefully add 10.5 mL of hydrochloric acid. Using a pH meter, adjust with 6 N sodium hydroxide to a pH of 4.0. Dilute with water to 1000 mL, and mix.

Derivatizing reagent: Dissolve 0.8 g of o-phthalaldehyde in 2 mL of 2-mercaptoethanol. Add to a solution containing 24.70 g of boric acid and 22.35 g of potassium hydroxide in 1000 mL of water, and mix.

Reactivating solution: 0.2 N sodium hydroxide. Prepare by dissolving 0.8 g of sodium hydroxide in 100 mL of water.

Standard solution: 0.01 mg/mL of USP S-Allyl-L-cysteine RS in water

Sample solution: Transfer about 2.0 g of Fluidextract, accurately weighed, to a 100-mL volumetric flask, dilute with trichloroacetic acid solution (5 in 100) to volume, and mix. Centrifuge for 5 min, and filter the supernatant.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: Fluorometric detector; excitation wavelength of 340 nm and emission wavelength of 455 nm

Column: 4.6-mm \times 12-cm; packing L17

Column temperature: 40°

Injection size: 10 μ L

[NOTE—The *Mobile phase* and the *Reactivating solution* are pumped separately, each at the rate of 0.4 mL/min, by pumps connected to the opposing arms of a tee. The outlet of the tee is connected to the injector and the chromatographic column. The outlet of the column is attached to a tee, the opposing arm of which is attached to a tube from which the *Derivatizing reagent* is constantly pumped through the sys-

tem at a rate of 0.6 mL/min. The outlet of the tee is connected to a 0.5-mm \times 2.0-m postcolumn polytetrafluoroethylene reaction coil maintained at 40°. The outlet of the reaction coil is connected to the detector. The system is programmed to deliver the *Mobile phase* for 10 min, the *Reactivating solution* for the next 6 min, and the *Mobile phase* for the 24 min remaining before the next injection.]

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor (k'): 2.5–4.5

Tailing factor: NMT 2.0 for the S-allyl-L-cysteine peak

Relative standard deviation: NMT 2.0% for the S-allyl-L-cysteine peak in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of S-allyl-L-cysteine ($C_6H_{11}SN$) in the portion of Fluidextract taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak height of S-allyl-L-cysteine from the *Sample solution*

r_S = peak height of S-allyl-L-cysteine from the *Standard solution*

C_S = concentration of the USP S-Allyl-L-cysteine RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Fluidextract used to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.05% on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method II <231>:** NMT 10 ppm

- **ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- **RESIDUE ON EVAPORATION:** Proceed as directed under *Botanical Extracts* <565>; NLT 20% of the Fluidextract portion taken remains as residue.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash <561>:** NMT 3.0%
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash <561>:** NMT 0.2%
- **PH <791>:** 4.5–6.5
- **OTHER REQUIREMENTS:** Meets the requirements under *Botanical Extracts* <565>, *General Pharmacopeial Requirements*, sections for *Packaging and Storage*, *Labeling*, *Pesticide Residues*, and *Alcohol Content* for Fluidextracts

ADDITIONAL REQUIREMENTS

- **USP REFERENCE STANDARDS <11>:** USP S-Allyl-L-cysteine RS

Garlic Delayed-Release Tablets

DEFINITION

Garlic Delayed-Release Tablets are prepared from Powdered Garlic or Powdered Garlic Extract and contain NLT 90.0% and NMT 140.0% of the labeled amount of alliin ($C_6H_{11}NO_3S$) and NLT 90.0% and NMT 140.0% of the labeled amount of potential allicin ($C_6H_{10}OS_2$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 0.5 mg/mL of USP L-Methionine RS

Standard solution B: 0.5 mg/mL of USP Alliin RS, in a mixture of methanol and water (1:1)

Sample solution: Transfer an amount of pulverized Tablets, equivalent to 30 mg of alliin, to a 100-mL volumetric flask. Add 70 mL of a mixture of methanol and water (1:1), shake, and centrifuge. Concentrate to a small volume (about 5 mL) using a rotary evaporator.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Application volume: 20 μ L, applied separately as 10-mm bands

Developing solvent system: Butyl alcohol, *n*-propyl alcohol, glacial acetic acid, and water (3:1:1:1)

Spray reagent: 2 mg/mL of ninhydrin, in a mixture of butyl alcohol and 2 N acetic acid (19:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Proceed as directed in the chapter. Spray with the *Spray reagent*, heat at 100°–105° for 10 min, and immediately examine the plate.

Acceptance criteria: The chromatogram of the *Sample solution* shows the following orange and pinkish violet zones: a violet zone having an R_f value of 0.89; a pink zone having an R_f value of 0.5 and corresponding in color and R_f value to that of the chromatogram of *Standard solution A*; a pinkish zone having an R_f value of 0.43; a strong orange zone having an R_f value of 0.38; a pinkish violet zone having an R_f value of 0.3 and corresponding in color and R_f value to that of the chromatogram of *Standard solution B*; and additional pinkish orange zones situated very close to each other, just below the zone attributed to alliin in the chromatogram of *Standard solution B*.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Alliin*.

Acceptance criteria: The *Sample solution* exhibits a peak for alliin corresponding to one of the diastereoisomer pairs of peaks in the *Standard solution*.

STRENGTH

• CONTENT OF ALLIIN

Alliinase inhibitor solution: Dissolve 109 mg of carboxymethoxylamine hemihydrochloride in 100.0 mL of water.

Solution A: Dissolve 1.24 g of monobasic sodium phosphate in 100 mL of water, adjust with 0.2 M sodium hydroxide to a pH of 7.1, and dilute with water to 200.0 mL.

Buffer: Dissolve 1.38 g of monobasic sodium phosphate in 100 mL of water, adjust with 0.2 M sodium hydroxide to a pH of 9.5, and dilute with water to 200.0 mL.

Derivatization reagent: Dissolve 140 mg of *o*-phthalaldehyde in 5 mL of methanol, add 100 μ L of *t*-butylthiol, and dilute with *Buffer* to 50 mL. [NOTE—This reagent may occasionally become opaque during preparation. Store at room temperature, and use within 1 week.]

Mobile phase: Acetonitrile, 1,4-dioxane, tetrahydrofuran, and *Solution A* (25: 2.9: 2.2: 69.9)

Standard solution: 0.05 mg/mL of USP Alliin RS in a mixture of methanol and water (1:1). Use a syringe to transfer 0.1 mL of this solution to a septum-capped vial, and add 0.5 mL of the *Derivatization reagent*. Allow a reaction time of NLT 2 min before injection into the chromatograph.

Sample solution: Pulverize a counted number of Tablets, equivalent to 50 mg of alliin, with a mortar and pestle. Transfer a quantity of powder equivalent to 5 mg of alliin to a 100-mL volumetric flask. Add 70 mL of *Alliinase inhibitor solution*, and shake for 1 min. Dilute

with *Alliinase inhibitor solution* to volume. Use a volumetric syringe to transfer 0.1 mL of this solution to a septum-capped vial, and add 0.5 mL of the *Derivatization reagent*. Allow a reaction time of NLT 2 min before injection into the chromatograph.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 337 nm

Column: 4-mm × 10-cm; packing L1

Flow rate: 1 mL/min

[NOTE—Alliin exhibits two major peaks, representing its diastereomers.]

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for each of the major peaks

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Record the chromatograms, and measure the areas of the responses of the alliin diastereomer peaks.]

Calculate the percentage of alliin in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for alliin from the *Sample solution*

r_S = sum of the peak area for alliin diastereomers from the *Standard solution*

C_S = concentration of USP Alliin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of alliin in the *Sample solution* (µg/mL)

Acceptance criteria: 90%–140.0%

• CONTENT OF POTENTIAL ALLICIN

Alliinase inhibitor solution: Dissolve 109 mg of carboxymethoxylamine hemihydrochloride in 100.0 mL of water.

Crude alliinase solution: Homogenize 5 g of raw garlic cloves with 25 mL of water. Filter, and extract three times with 50 mL of *tert*-butyl methyl ether. Discard the organic phase, and remove the residual solvent from the aqueous phase by rotary evaporation in vacuum for 5 min. Filter, and store frozen in small vials. [NOTE—This solution is stable for 6 months when stored as directed. Thaw at room temperature just before use.]

Mobile phase: Methanol and water (3:2)

Standard stock solution: 50 µg/mL of USP Alliin RS

Standard solution: Transfer 1.0 mL of the *Standard stock solution* to a 5-mL volumetric flask containing 100 µL of *Crude alliinase solution*, and allow to stand for 5 min at room temperature. Dilute with water to volume, and pass through a filter having a 0.45-µm or finer pore size.

Sample solution: Transfer an equivalent to 5 mg of potential alliin, from finely powdered Tablets (NLT 20), to a 200-mL volumetric flask, and add 25 mL of water. Incubate at room temperature for exactly 30 min. Stop the enzymatic reaction by diluting with *Alliinase inhibitor solution* to volume. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a 5-mL volumetric flask, and dilute with water to volume.

Blank solution: 100 µL of *Crude alliinase solution* diluted with water to 1 mL

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

[NOTE—The alliin peak is identified by comparing the chromatograms of the *Blank solution* and the *Standard solution*.]

Suitability requirements

Resolution: NLT 2.0 between the alliin peak and the preceding peak at a relative retention time of 0.80 (allyl methyl thiosulfonates), *Sample solution*

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

Calculate the percentage of potential alliin in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of alliin, corrected by the response of the *Blank solution*, from the *Sample solution*

r_S = peak area of alliin, corrected by the response of the *Blank solution*, from the *Standard solution*

C_S = concentration of USP Alliin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of potential alliin in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of alliin, 162.26

M_{r2} = twice the molecular weight of alliin, 354.42

Acceptance criteria: 90.0%–140.0%

PERFORMANCE TESTS

- **ALLICIN RELEASE:** Proceed as directed in *Dissolution* <711> for *Method A* in *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*. Place a number of Tablets, equivalent to 5 mg of potential alliin, in each vessel.

Apparatus 2: 100 rpm

Time: 60 min for the *Buffer stage*

Crude alliinase solution, Mobile phase, Blank solution, and Chromatographic system: Proceed as directed in the test for *Content of Potential Alliin*.

Standard stock solution: 50 µg/mL of USP Alliin RS

Standard solution: Transfer 1.0 mL of the *Standard stock solution* to a 5-mL volumetric flask containing 100 µL of *Crude alliinase solution*, and allow to stand for 5 min at room temperature. Dilute with water to volume, and pass through a membrane filter having a 0.45-µm or finer pore size.

Sample solution: Transfer 1.0 mL of the solution under test to a test tube containing 50 µL of 0.21 M carboxymethoxylamine hemihydrochloride solution.

[NOTE—The solution must be transferred immediately upon removal from the dissolution vessel to inhibit the alliinase enzyme.]

Injection size: 100 µL

Analysis

[NOTE—Do not perform the alliin determination in the *Acid stage*.]

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of potential alliin released in the *Buffer stage*:

$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of alliin from the *Sample solution*

r_S = peak area of alliin from the *Standard solution*

C_S = concentration of USP Alliin RS in the *Standard solution* (µg/mL)

D = dilution factor for the *Sample solution*, 1.050
(1 mL of the *Sample solution* + 50 μ L of 0.21 M carboxymethoxylamine hemihydrochloride solution)

V = volume of final medium, 1000 mL

L = labeled amount of potential allicin (μ g/Tablet)

M_{r1} = molecular weight of allicin, 162.26

M_{r2} = twice the molecular weight of alliin, 354.42

Tolerances: It meets the requirements of *Acceptance Table 4* in *Dissolution* (711). [NOTE— Q is the percentage of the labeled amount of potential allicin released only in the *Buffer stage*.]

- **WEIGHT VARIATION (2091):** Meet the requirements

SPECIFIC TESTS

• ALLIINASE ACTIVITY

Alliinase inhibitor solution, Solution A, Buffer, Derivatization reagent, Mobile phase, Standard solution, and Chromatographic system: Proceed as directed in the test for *Content of Alliin*.

Sample solution: Transfer an equivalent to 5 mg of alliin, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask, and add 25 mL of water. Incubate at room temperature for exactly 5 min. Stop the enzymatic reaction by diluting with *Alliinase inhibitor solution* to volume. Centrifuge a portion of this solution, and use a volumetric syringe to transfer 0.1 mL of the supernatant to a septum-capped vial. Add 0.5 mL of the *Derivatization reagent*, and allow a reaction time of NLT 2 min before injection into the chromatograph.

Analysis

Samples: *Standard solution* and *Sample solution*
Proceed as directed in the test for *Content of Alliin*.

Acceptance criteria: The area of the alliin peak from the *Sample solution* is NMT 1% of the area of the alliin peak from the *Standard solution*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. Label it to indicate the amount of total alliin, in μ g/Tablet, and the amount of potential allicin, in μ g/Tablet.
- **USP REFERENCE STANDARDS (11)**
USP Alliin RS
USP L-Methionine RS

Ginger

DEFINITION

Ginger is the dried rhizome of *Zingiber officinale* Roscoe (Fam. Zingiberaceae), scraped, partially scraped, or unscraped. It is known in commerce as unbleached ginger.

IDENTIFICATION

- **A.**
Analysis: Pulverize 5 g of Ginger. To 1 g of the pulverized Ginger add 5 mL of dilute acetic acid, prepared by diluting 1 part of glacial acetic acid with 1 part of water, and shake for 15 min. Filter, and add a few drops of ammonium oxalate TS to the filtrate.
Acceptance criteria: NMT a slight turbidity is produced.
- **B.**
Sample: 50 mg of the residue obtained in the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives*
Analysis: Dissolve the *Sample* in 25 mL of water, and extract this solution with two 15-mL portions of ether. Combine the ether extracts, and evaporate in a porcelain dish. To the residue add 5 mL of sulfuric acid solu-

tion (7.5 in 10.0) and 5 mg of vanillin. Allow to stand for 15 min, and add an equal volume of water.

Acceptance criteria: The solution turns azure blue.

• C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: Proceed as directed for the *Sample solution*, except to use 0.2 g of USP Powdered Ginger RS.

Standard solution B: Use the *System suitability solution*, prepared as directed in the test for *Content of Gingerols and Gingerdiones*.

Sample solution: Pulverize 5 g of Ginger. Transfer 0.2 g of pulverized Ginger to a test tube, add 5 mL of methanol, shake for 30 min, and centrifuge. Apply the supernatant to the plate.

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 μ L for the *Sample solution* and *Standard solution A*; 40 μ L for *Standard solution B*

Developing solvent system: Ether and hexanes (7:3)

Spray reagent: 10% sulfuric acid in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed in the chapter. Examine the plate under UV light at 254 nm. Spray the plate with *Spray reagent*, heat at 100°–105° for 10 min, and examine under daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a spot due to gingerols that occurs at an R_f value of 0.2. A spot of shogaols may occur at an R_f value of 0.4, corresponding to those shown in the chromatogram of *Standard solution B*. [NOTE—The chromatograms of the *Sample solution* and *Standard solution A* may exhibit other spots in the upper region and at the origin of the plate.]

COMPOSITION

• CONTENT OF GINGEROLS AND GINGERDIONES

Solution A: Acetonitrile, dilute phosphoric acid (1 in 1000), and methanol (55:44:1)

Solution B: Acetonitrile

Mobile phase: Use *Solution A* for NLT seven times the retention time of capsaicin.

Column washing: After each chromatographic run, wash the column, using *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	0	100
12	0	100
14	100	0
29	100	0

Standard solution: 0.1 mg/mL of USP Capsaicin RS in methanol

System suitability solution: Reconstitute the content of 1 vial of USP Ginger Constituent Mixture RS in 1 mL of the *Standard solution*.

Sample solution: Use the filtrate retained from the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 282 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 25 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for 6-gingerol, capsaicin, and 6-shogaol are about 0.8, 1.0, and 1.9, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 3.0 between the 6-gingerol and capsaicin peaks and NLT 10.0 between the capsaicin and 6-shogaol peaks, *System suitability solution*

Tailing factors: NMT 2.0 for the 6-gingerol, capsaicin, and 6-shogaol peaks, *System suitability solution*

Relative standard deviation: NMT 2.5%, *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *System suitability solution*

Calculate the sum of the peak responses due to gingerols and gingerdiones occurring at about the following retention times, relative to 1.0 for capsaicin: 0.8 for 6-gingerol, 1.5 for 8-gingerol A, 2.2 for 8-gingerol B, 2.5 for 6-gingerdiol, 2.6 for 6-gingerdione, 3.4 for 10-gingerol, and 5.2 for 8-gingerdione.

Calculate the percentage of gingerols and gingerdiones in the sample taken:

$$\text{Result} = (r_T/r_S) \times (C_S/W) \times 10$$

r_T = sum of the peak responses for gingerols and gingerdiones from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C_S = concentration of USP Capsaicin RS in the *Standard solution* (mg/mL)

W = weight of Ginger used in the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives* (g)

Acceptance criteria: NLT 0.8%

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements
- **MICROBIAL ENUMERATION TESTS (2021):** The total bacterial count does not exceed 10^5 cfu/g; the total combined molds and yeasts count does not exceed 10^3 cfu/g; the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Ginger occurs in horizontal, laterally flattened, sympodially branching pieces. Whole rhizomes are 5–15 cm long, 1.5–6 cm wide, and up to 2 cm thick, sometimes split longitudinally, pale yellowish buff or light brown externally, longitudinally striated, somewhat fibrous; branches flattish, obovate, short, about 2 cm long, each ending with a depressed stem scar; fracture, short with projecting fibers, or sometimes resinous; internally yellowish brown, showing a yellow endodermis separating the narrow cortex from the wide stele, and numerous yellowish points, secretion cells and numerous bigger greyish points, vascular bundles, scattered on the whole surface. The unscrapped rhizome shows in addition an outer layer of dark brown cork. Morphological characteristics of different varieties and forms of Ginger from different geographical areas are listed in *Table 1* of the general information chapter *Supplemental Information for Articles of Botanical Origin* (2030).

Histology: The scrapped rhizome in transverse section shows a cortex composed of multiple layers of parenchyma cells rich in simple, large, flattened, ovoid or sack-shaped starch granules, 5–15 μm wide and 30–60 μm long having an eccentric hilum, some

showing faint transverse striations. The cortex also shows numerous oleoresin cells with a yellow or yellowish-brown content and scattered collateral vascular bundles; a single layer of endodermal cells free from starch; a wide central stele composed of parenchyma cells rich in starch and oleoresin cells similar to those of the cortex, and containing scattered collateral vascular bundles, some enclosed in a sheath of septate nonlignified fibers with wide lumen. In addition to the above, the unscrapped rhizome shows an outer zone of dark brown cork cells.

• LIMIT OF SHOGAOLS

Analysis: From the chromatograms obtained in the test for *Content of Gingerols and Gingerdiones*, calculate the sum of the peak responses due to shogaols, occurring at the following retention times, relative to 1.0 for capsaicin: 1.9 for 6-shogaol, 4.2 for 8-shogaol, and 5.8 for 10-shogaol.

Calculate the percentage of shogaols in the portion taken:

$$\text{Result} = (r_T/r_S) \times (C_S/W) \times 10$$

r_T = sum of the peak responses of shogaols from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C_S = concentration of USP Capsaicin RS in the *Standard solution*, prepared as directed in the test for *Content of Gingerols and Gingerdiones* (mg/mL)

W = weight of Ginger used in the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives* (g)

Acceptance criteria: NMT 0.18%

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 2.0%
- **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2 (561):** **Analysis:** Collect the filtrate in a 100-mL volumetric flask, and dilute with alcohol to volume. Evaporate 50 mL of the filtrate at a temperature not exceeding 90°. [NOTE—Save the residue for use in *Identification test B* and the remaining volume of the filtrate for the tests for *Limit of Shogaols* and *Content of Gingerols and Gingerdiones*.] **Acceptance criteria:** NLT 4.5% residue
- **ARTICLES OF BOTANICAL ORIGIN, Content of Starch, Method 1 (561):** NLT 42%, *Method 1a* of the *General Procedures* being used
- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 1.0%
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 8.0%
- **ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Content (561):** NLT 1.8 mL/100 g
- **ARTICLES OF BOTANICAL ORIGIN, Water-Soluble Ash (561):** NLT 1.9%
- **ARTICLES OF BOTANICAL ORIGIN, Water-Soluble Extractives, Method 2 (561):** NLT 10.0%
- **WATER DETERMINATION, Method 1a (921):** NMT 10%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store in a cool area.
- **LABELING:** The label states the Latin binominal and, following the official name, the part of the plant contained in the article. This article is exempted from the requirements of the *General Notices* with respect to the pregnancy and lactation statement (section 10.40.50, *Labeling Botanical-Containing Products*).

• **USP REFERENCE STANDARDS** (11)

USP Capsaicin RS
USP Ginger Constituent Mixture RS
USP Powdered Ginger RS

Powdered Ginger

DEFINITION

Powdered Ginger is Ginger reduced to a fine or a very fine powder.

IDENTIFICATION

- **A.**
Analysis: To 1 g of the Powdered Ginger add 5 mL of dilute acetic acid, prepared by diluting 1 part of glacial acetic acid with 1 part of water, and shake for 15 min. Filter, and add a few drops of ammonium oxalate TS to the filtrate.

Acceptance criteria: NMT a slight turbidity is produced.

- **B.**
Sample: 50 mg of the residue obtained in the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives*
Analysis: Dissolve the *Sample* in 25 mL of water, and extract this solution with two 15-mL portions of ether. Combine the ether extracts, and evaporate in a porcelain dish. To the residue add 5 mL of sulfuric acid solution (7.5 in 10.0) and 5 mg of vanillin. Allow to stand for 15 min, and add an equal volume of water.

Acceptance criteria: The solution turns azure blue.

• **C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution A: Proceed as directed for the *Sample solution*, except to use 0.2 g of USP Powdered Ginger RS.

Standard solution B: Use the *System suitability solution*, prepared as directed in the test for *Content of Gingerols and Gingerdiones*.

Sample solution: Transfer 0.2 g of Powdered Ginger to a test tube, add 5 mL of methanol, shake for 30 min, and centrifuge. Apply the supernatant to the plate.

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 µL for the *Sample solution* and *Standard solution A*; 40 µL for *Standard solution B*

Developing solvent system: Ether and hexanes (7:3)

Spray reagent: 10% sulfuric acid in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed in the chapter. Examine the plate under UV light at 254 nm. Spray the plate with *Spray reagent*, heat at 100°–105° for 10 min, and examine under daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a spot due to gingerols that occurs at an R_f value of 0.2. A spot of shogaols may occur at an R_f value of 0.4, corresponding to those shown in the chromatogram of *Standard solution B*. [NOTE—The chromatograms of the *Sample solution* and *Standard solution A* may exhibit other spots in the upper region and at the origin of the plate.]

COMPOSITION

• **CONTENT OF GINGEROLS AND GINGERDIONES**

Solution A: Acetonitrile, dilute phosphoric acid (1 in 1000), and methanol (55:44:1)

Solution B: Acetonitrile

Mobile phase: Use *Solution A* for NLT seven times the retention time of capsaicin.

Column washing: After each chromatographic run, wash the column, using *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	0	100
12	0	100
14	100	0
29	100	0

Standard solution: 0.1 mg/mL of USP Capsaicin RS in methanol

System suitability solution: Reconstitute the content of 1 vial of USP Ginger Constituent Mixture RS in 1 mL of the *Standard solution*.

Sample solution: Use the filtrate retained from the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 282 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 25 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for 6-gingerol, capsaicin, and 6-shogaol are about 0.8, 1.0, and 1.9, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 3.0 between the 6-gingerol and capsaicin peaks and NLT 10.0 between the capsaicin and 6-shogaol peaks, *System suitability solution*

Tailing factors: NMT 2.0 for the 6-gingerol, capsaicin, and 6-shogaol peaks, *System suitability solution*

Relative standard deviation: NMT 2.5%, *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *System suitability solution*

Calculate the sum of the peak responses due to gingerols and gingerdiones, occurring at about the following retention times, relative to 1.0 for capsaicin: 0.8 for 6-gingerol, 1.5 for 8-gingerol A, 2.2 for 8-gingerol B, 2.5 for 6-gingerdiol, 2.6 for 6-gingerdione, 3.4 for 10-gingerol, and 5.2 for 8-gingerdione.

Calculate the percentage of gingerols and gingerdiones in the sample taken:

$$\text{Result} = (r_T/r_S) \times (C_S/W) \times 10$$

r_T = sum of the peak responses of gingerols and gingerdiones from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C_S = concentration of USP Capsaicin RS in the *Standard solution* (mg/mL)

W = weight of Powdered Ginger used in the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives* (g)

Acceptance criteria: NLT 0.8%

CONTAMINANTS

• **HEAVY METALS** (231): NMT 20 ppm

• **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** (561): Meets the requirements

• **MICROBIAL ENUMERATION TESTS** (2021): The total bacterial count does not exceed 10^5 cfu/g; the total combined molds and yeasts count does not exceed 10^3 cfu/g; the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu/g.

• **ABSENCE OF MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Under a microscope, Powdered Ginger reveals mainly starch granules and parenchyma cells containing them; simple, large, flattened, ovoid or sack-shaped starch granules, 5–15 μm wide and 30–60 μm long having an eccentric hilum, some showing faint transverse striations; parenchyma cells containing yellow-brown to dark brown resinous substances; groups of large, thin-walled nonlignified septate fibers with wide lumen; portions of septate fibers with attached vessels; large vessels with annular, spiral, or reticulate thickening and often accompanied by parenchyma cells containing brown content; oleoresin in fragments or droplets, staining with iodine TS and potassium iodide TS; and, rarely, fragments of brown cork tissue, usually seen in surface view. Sclerenchymatous cells, trichomes, and calcium oxalate are absent.

- **LIMIT OF SHOGAOLS**

Analysis: From the chromatograms obtained in the test for *Content of Gingerols and Gingerdiones*, calculate the sum of the peak responses due to shogaols, occurring at the following retention times, relative to 1.0 for capsaicin: 1.9 for 6-shogaol, 4.2 for 8-shogaol, and 5.8 for 10-shogaol.

Calculate the percentage of shogaols in the portion of Powdered Ginger taken:

$$\text{Result} = (r_T/r_S) \times (C_S/W) \times 10$$

r_T = sum of the peak responses of shogaols from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C_S = concentration of USP Capsaicin RS in the *Standard solution*, prepared as directed in the test for *Content of Gingerols and Gingerdiones* (mg/mL)

W = weight of Powdered Ginger used in the test for *Articles of Botanical Origin, Alcohol-Soluble Extractives* (g)

Acceptance criteria: NMT 0.18%

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash <561>:** NMT 2.0%
- **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2 <561>**
Analysis: Collect the filtrate in a 100-mL volumetric flask, and dilute with alcohol to volume. Evaporate 50 mL of the filtrate at a temperature not exceeding 90°.
Acceptance criteria: NLT 4.5% residue. [NOTE—Save the residue for use in *Identification test B*, and the remaining volume of the filtrate for the tests for *Limit of Shogaols* and *Content of Gingerols and Gingerdiones*.]
- **ARTICLES OF BOTANICAL ORIGIN, Content of Starch, Method 1 <561>:** NLT 42%, *Method 1a* of the *General Procedures* being used
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash <561>:** NMT 8.0%
- **ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Content <561>:** NLT 1.8 mL/100 g
- **ARTICLES OF BOTANICAL ORIGIN, Water-Soluble Ash <561>:** NLT 1.9%
- **ARTICLES OF BOTANICAL ORIGIN, Water-Soluble Extractives, Method 2 <561>:** NLT 10.0%
- **WATER DETERMINATION, Method 1a <921>:** NMT 10%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store in a cool area.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. This article is exempted from the requirements of the *General Notices*

with respect to the pregnancy and lactation statement (section 10.40.50, *Labeling Botanical-Containing Products*).

- **USP REFERENCE STANDARDS <11>**

USP Capsaicin RS

USP Ginger Constituent Mixture RS

USP Powdered Ginger RS

Ginger Capsules

DEFINITION

Ginger Capsules are prepared from Powdered Ginger and contain NLT 90.0% and NMT 110.0% of the labeled amount of gingerols, gingerdiones, and shogaols, and NLT 90.0% of the labeled amount of volatile oil.

IDENTIFICATION

- **A.**

Analysis: Pulverize an amount of the contents of Capsules equivalent to 5 g of ginger. To an amount equivalent to 1 g of ginger add 5 mL of dilute acetic acid, prepared by diluting 1 part of glacial acetic acid with 1 part of water, and shake for 15 min. Filter, and add a few drops of ammonium oxalate TS to the filtrate.

Acceptance criteria: NMT a slight turbidity is produced.

- **B.**

Sample (see *Articles of Botanical Origin <561>, Alcohol-Soluble Extractives, Method 2*): Collect the filtrate in a 100-mL volumetric flask, and dilute with alcohol to volume. Evaporate 50 mL of the filtrate at a temperature not exceeding 90°. Use 50 mg of the residue for the test.

Analysis: Dissolve the *Sample* in 25 mL of water, and extract with two 15-mL portions of ether. Combine the ether extracts, and evaporate in a porcelain dish. To the residue add 5 mL of sulfuric acid solution (7.5 in 10.0) and 5 mg of vanillin. Allow to stand for 15 min, and add an equal volume of water.

Acceptance criteria: The solution turns azure blue.

- **C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution A: Proceed as directed for the *Sample solution*, except to use 0.2 g of USP Powdered Ginger RS.

Standard solution B: Use the *System suitability solution*, prepared as directed in the test for *Content of Gingerols, Gingerdiones, and Shogaols*.

Sample solution: Pulverize an amount of the contents of Capsules equivalent to 5 g of ginger. Transfer an amount equivalent to 0.2 g of ginger to a test tube, add 5 mL of methanol, shake for 30 min, and centrifuge. Apply the supernatant to the plate.

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 μL for *Standard solution A* and the *Sample solution*; 40 μL for *Standard solution B*

Developing solvent system: Ether and hexanes (7:3)

Spray reagent: 10% sulfuric acid in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed in the chapter. Examine the plate under UV light at 254 nm. Spray the plate with *Spray reagent*, heat at 100°–105° for 10 min, and examine under daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a spot due to gingerols that occurs at an R_f value of 0.2, and a spot of shogaols may occur at an R_f value of 0.4, corresponding to those shown in the chromatogram of *Standard solution B*. [NOTE—The chromatograms of *Standard solution A* and the *Sample solution* may exhibit other spots in the upper region and at the origin of the plate.]

STRENGTH**• CONTENT OF GINGEROLS, GINGERDIONES, AND SHOGAOLS**

Solution A: Acetonitrile, dilute phosphoric acid (1 in 1000), and methanol (55:44:1)

Solution B: Acetonitrile

Mobile phase: Use *Solution A* for NLT seven times the retention time of capsaicin.

Column washing: After each chromatographic run, wash the column, using *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	0	100
12	0	100
14	100	0
29	100	0

Standard solution: 0.1 mg/mL of USP Capsaicin RS in methanol

System suitability solution: Reconstitute the content of 1 vial of USP Ginger Constituent Mixture RS in 1 mL of the *Standard solution*.

Sample solution: Mix and finely powder the contents of NLT 20 Capsules, and transfer an amount equivalent to 2.0 g of powdered ginger to a glass-stoppered conical flask. Add 50 mL of alcohol, insert a stopper into the flask, and macerate for 24 h, shaking frequently during the first 8 h, and then allowing to stand for 16 h. Filter, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 282 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 25 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for 6-gingerol, capsaicin, and 6-shogaol are about 0.8, 1.0, and 1.9, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 3.0 between the 6-gingerol and capsaicin peaks and NLT 10.0 between the capsaicin and 6-shogaol peaks, *System suitability solution*

Tailing factors: NMT 2.0 for the 6-gingerol, capsaicin, and 6-shogaol peaks, *System suitability solution*

Relative standard deviation: NMT 2.5% for the capsaicin peak for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *System suitability solution*

Calculate the sum of the peak responses due to gingerols and gingerdiones occurring at about the following retention times relative to 1.0 for capsaicin: 0.8 for 6-gingerol, 1.5 for 8-gingerol A, 2.2 for 8-gingerol B, 2.5 for 6-gingerdiol, 2.6 for 6-gingerdione, 3.4 for 10-gingerol, and 5.2 for 8-gingerdione.

Calculate the sum of the peak responses due to shogaols, occurring at about the following retention times, relative to 1.0 for capsaicin: 1.9 for 6-shogaol, 4.2 for 8-shogaol, and 5.8 for 10-shogaol.

Calculate the percentage of the labeled amount of gingerols, gingerdiones, and shogaols in the portion of Capsules taken:

$$\text{Result} = (r_T/r_S) \times C_S \times (V/W_U) \times (A_{WC}/L) \times 100$$

r_T = sum of the peak responses for gingerols, gingerdiones, and shogaols from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C_S = concentration of USP Capsaicin RS in the *Standard solution* (mg/mL)

V = final volume of the *Sample solution* (mL)

W_U = weight of the portion of Capsules taken (mg)

A_{WC} = average weight of the Capsule content (mg)

L = labeled amount of gingerols, gingerdiones, and shogaols (mg/Capsule)

Acceptance criteria: 90.0%–110.0% of the labeled amount of gingerols, gingerdiones, and shogaols. Calculate the amount (G_0), in mg, of 6-gingerol in each Capsule taken:

$$G_0 = (r_U/r_S) \times (C_S/W) \times V \times A$$

r_U = peak response of 6-gingerol from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C_S = concentration of USP Capsaicin RS in the *Standard solution* (mg/mL)

W = weight of powdered ginger used in the preparation of the *Sample solution* (g)

V = final volume of the *Sample solution* (mL)

A = average Capsule fill weight (g)

• ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Determination <561>

Sample: Finely powder a quantity of Capsules, equivalent to 100 g of powdered ginger.

Acceptance criteria: NLT 1.4 mL/100 g (NLT 90.0% of the labeled amount of volatile oil)

PERFORMANCE TESTS**• DISINTEGRATION AND DISSOLUTION <2040>:** Meet the requirements for *Dissolution*

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 75 rpm

Time: 60 min

[NOTE—In each dissolution vessel, place a number of Capsules equivalent to 20 mg of the labeled amounts of gingerols, gingerdiones, and shogaols.]

Solution A, Solution B, Mobile phase, Column washing, System suitability solution,

Chromatographic system, and System suitability:

Proceed as directed in the test for *Content of Gingerols, Gingerdiones, and Shogaols*.

Standard stock solution: Use the *Standard solution* prepared in the test for *Content of Gingerols, Gingerdiones, and Shogaols*.

Standard solution: 0.025 mg/mL of USP Capsaicin RS from *Standard stock solution* in *Medium*

Sample solution: Transfer an aliquot of solution from each dissolution vial to a suitable vial. Allow to stand for 5 min so that the powder settles into the suspension, or centrifuge to obtain a clear supernatant. Pass through a membrane filter of 0.45-µm or finer pore size.

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Allow the *Sample solution* to elute for NLT three times the retention time of capsaicin.]

Calculate the quantity, G , in mg, of 6-gingerol dissolved from each Capsule taken:

$$G = (r_U/r_S) \times (C/N) \times V$$

r_U = peak response of 6-gingerol from the *Sample solution*

r_S = peak response of capsaicin from the *Standard solution*

C = concentration of USP Capsaicin RS in the *Standard solution* (mg/mL)

N = number of Capsules in each vessel
 V = volume of *Medium*; 500 mL
 Calculate the percentage of the relative amount of 6-gingerol dissolved:

$$\text{Result} = (G/G_0) \times 100$$

G_0 = content of 6-gingerol in each Capsule, as determined in the test for *Content of Gingerols, Gingerdiones, and Shogaols* (mg)

Tolerances: NLT 60% of the content of 6-gingerol ($C_{17}H_{26}O_4$) is dissolved.

- **WEIGHT VARIATION (2091):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of gingerols, gingerdiones, and shogaols, in mg per Capsule, and the content of volatile oil, in μL per Capsule. This article is exempted from the requirements of the *General Notices* with respect to the pregnancy and lactation statement (section 10.40.50, *Labeling Botanical-Containing Products*).
- **USP REFERENCE STANDARDS (11)**
 USP Capsaicin RS
 USP Ginger Constituent Mixture RS
 USP Powdered Ginger RS

Ginger Tincture

DEFINITION

Ginger Tincture is prepared as follows.

Ginger	200 g
A mixture of Alcohol and Water (7:3), a sufficient quantity to make	1000 mL

Prepare the Tincture as directed for *Botanical Extracts* (565), *Tinctures, Maceration Process*. It contains NLT 0.10% of gingerols.

IDENTIFICATION

- **THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution A: Transfer 0.2 g of USP Powdered Ginger RS to a test tube, add 5 mL of methanol, shake for 30 min, and centrifuge. Apply the supernatant to the plate.

Standard solution B: Use the *System suitability solution*, prepared as directed in the test for *Content of Gingerols*.

Sample solution: Tincture

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 μL for the *Sample solution* and *Standard solution A*; 40 μL for *Standard solution B*

Developing solvent system: Ethyl ether and hexane (7:3)

Spray reagent: 10% sulfuric acid in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber and dry. Examine the plate under UV light at 254 nm. Spray the plate with *Spray reagent*, heat at 100°–105° for 10 min, and examine under daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a spot due to gingerols that occurs at

an R_f value of 0.2, and a spot of shogaols may occur at an R_f value of 0.4, corresponding to the chromatogram of *Standard solution B*. [NOTE—The chromatograms of the *Sample solution* and *Standard solution A* may exhibit other spots in the upper region and at the origin of the plate.]

STRENGTH

- **CONTENT OF GINGEROLS**

Solution A: Acetonitrile, dilute phosphoric acid (1 in 1000), and methanol (55:44:1)

Solution B: Acetonitrile

Mobile phase: Use *Solution A* for NLT seven times the retention time of capsaicin.

Column washing: After each chromatographic run, wash the column, using *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)

 USP Capsaicin RS
 USP Ginger Constituent Mixture RS
 USP Powdered Ginger RS

Ginkgo

DEFINITION

Ginkgo consists of the dried leaf of *Ginkgo biloba* L. (Fam. Ginkgoaceae). It contains NLT 0.5% of flavonoids, calculated as flavonol glycosides, with a mean molecular mass of 756.7; and NLT 0.1% of terpene lactones, calculated as the sum of bilobalide (C₁₅H₁₈O₈), ginkgolide A (C₂₀H₂₄O₉), ginkgolide B (C₂₀H₂₄O₁₀), and ginkgolide C (C₂₀H₂₄O₁₁), both on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Test for flavonoids

Standard solution: A solution of 0.6 mg/mL of USP Rutin RS, 0.2 mg/mL of USP Chlorogenic Acid RS, and 0.2 mg/mL of USP Quercetin RS in methanol

Sample solution: Transfer 1.0 g of finely powdered Ginkgo to a 50-mL round-bottom flask fitted with a reflux condenser. Add 10 mL of methanol, reflux in a water bath for 10 min, allow to cool to room temperature, and filter. [NOTE—Reserve some of the *Sample solution* for use in the *Test for terpene lactones*.]

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)

Application volume: 5 µL

Developing solvent system: Ethyl acetate, water, anhydrous formic acid, and glacial acetic acid (100:26:11:11)

Spray reagent 1: 5 mg/mL of 2-aminoethyl diphenylborinate in methanol

Spray reagent 2: 50 mg/mL of polyethylene glycol 400 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Before development of the chromatograms, saturate the chamber for 20 min with *Developing solvent system*. Record temperature and humidity in the laboratory. If the relative humidity exceeds 50%, condition the plate to about 35% relative humidity using a suitable device. Apply the samples separately as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), and allow the bands to dry. Develop the plate over a path of 6 cm, remove the plate from the chromatographic chamber, and dry in a circulating air oven at 105° for 5 min. Immediately spray the hot plate with *Spray reagent 1*, then with *Spray reagent 2*, dry, and examine under long-wavelength UV light.

Acceptance criteria: The *Standard solution* shows in its lower part with increasing R_f values a yellowish-brown fluorescent zone due to rutin (R_f 0.28), a light blue fluorescent zone due to chlorogenic acid (R_f 0.36), and a yellow fluorescent zone due to quercetin (R_f 0.92). The *Sample solution* shows a yellowish-brown fluorescent zone, a light blue fluorescent zone, and a yellowish-brown fluorescent zone at R_f similar to those of rutin, chlorogenic acid, and quercetin, respectively, in the *Standard solution*. Additional yellowish to yellowish-green zones due to flavonoids detected in the *Sample solution* chromatogram include one zone below the rutin zone, two zones between the rutin and chlorogenic acid zones, and two zones above the chlorogenic acid zone. Other zones may be seen in the *Sample solution* chromatogram.

Test for terpene lactones

Standard solution: Dissolve an amount of USP Ginkgo Terpene Lactones RS in methanol to obtain a solution containing in each mL about 1.0, 0.9, 0.6, 0.7, and 0.2 mg of bilobalide, ginkgolide A, ginkgolide B, ginkgolide C, and ginkgolide J, respectively.

Sample solution: Use the *Sample solution* prepared in the *Test for flavonoids*.

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates)

Application volume: 5 µL

Developing solvent system: Toluene, ethyl acetate, acetone, and methanol (20: 10: 10: 1.2)

Spray reagent: Acetic anhydride

Analysis

Samples: *Standard solution* and *Sample solution*

Immerse a suitable thin-layer chromatographic plate coated with *Adsorbent* for 2 s in an 8 g/200 mL solution of sodium acetate in methanol. Allow the excess liquid to drip from the plate, dry in a forced-air oven at 70° for 30 min, and cool in a desiccator. Apply the samples separately as bands to the impregnated plate (see *Chromatography* (621)), and allow the spots to air-dry. Before development of the chromatograms, saturate the chamber for 20 min with *Developing solvent system*. Record temperature and humidity in the laboratory. If the relative humidity exceeds 50%, condition the plate to about 35% relative humidity, using a suitable device. Develop the plate over a path of 6 cm, remove the plate from the chromatographic chamber, and dry in cold air. Spray the plate with *Spray reagent*, heat at 180° for 10 min, cool, and examine under short-wavelength UV light.

Acceptance criteria: The *Standard solution* chromatogram shows five distinct quenching zones correspond-

ing to the different ginkgo terpene lactones: ginkgolide C, ginkgolide J, ginkgolide B, ginkgolide A, and bilobalide at R_f values of about 0.13, 0.18, 0.32, 0.38, and 0.45, respectively. The *Sample solution* chromatogram shows a strong quenching zone at the application position, a broad quenching zone near the solvent front, and five distinct quenching zones corresponding to different ginkgo terpene lactones at R_f similar to those detected in the *Standard solution* chromatogram. [NOTE— R_f values may differ from one plate to another due to the impregnation step.]

COMPOSITION

• CONTENT OF FLAVONOL GLYCOSIDES

Extraction solvent: Alcohol, hydrochloric acid, and water (25:4:10)

Mobile phase: Methanol, water, and phosphoric acid (100:100:1)

Standard solution A: 0.02 mg/mL of USP Quercetin RS in methanol

Standard solution B: 0.02 mg/mL of USP Kaempferol RS in methanol

Standard solution C: 0.005 mg/mL of USP Isorhamnetin RS in methanol

Sample solution: Transfer about 1.0 g of Ginkgo, finely powdered, to a 250-mL flask fitted with a reflux condenser. Add 78 mL of *Extraction solvent*, and reflux on a hot water bath for 135 min. [NOTE—The solution will turn deep red. The color of the solution is not a definitive indication of reaction completeness.] Allow to cool to room temperature. Decant to a 100-mL volumetric flask. Add 20 mL of methanol to the 250-mL flask, and sonicate for 30 min. Filter, collect the filtrate in the 100-mL volumetric flask, wash the residue on the filter with methanol, collect the washing in the same 100-mL volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 370 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *Standard solution C*

[NOTE—The relative retention times for quercetin, kaempferol, and isorhamnetin are about 1.0, 1.8, and 2.0, respectively; *Standard solution A*, *Standard solution B*, and *Standard solution C*.]

Suitability requirements

Relative standard deviation: NMT 2.0% determined from the quercetin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the percentage of each flavonol glycoside in the portion of Ginkgo taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times F \times 10$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of the relevant analyte from *Standard solution A*, *Standard solution B*, or *Standard solution C*

C_S = concentration of the relevant analyte in *Standard solution A*, *Standard solution B*, or *Standard solution C* (mg/mL)

W = weight of Ginkgo taken to prepare the *Sample solution* (g)

F = mean molecular mass factor to convert each analyte into flavonol glycoside with a mean molecular mass of 756.7: 2.504 for quercetin, 2.437 for isorhamnetin, and 2.588 for kaempferol

Calculate the total percentage of flavonol glycosides by adding the individual percentages calculated.

Acceptance criteria: NLT 0.5% of flavonoids, as flavonol glycosides, with a mean molecular mass of 756.7, on the dried basis

• CONTENT OF TERPENE LACTONES

Solvent: Methanol and water (9:1)

Buffer solution: Dissolve 1.19 g of dibasic sodium phosphate and 8.25 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of 5.8.

Diluent: Methanol and water (1:1)

Solution A: Water

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
23	52	48
28	52	48
30	25	75
35	10	90
40	75	25
50	75	25

Standard solutions: Using the labeled content of the individual terpene lactones, prepare five solutions of the USP Ginkgo Terpene Lactones RS in *Diluent* within the range of 5–500 µg/mL for each of the relevant terpene lactones. Use sonication to dissolve the analytes if necessary. Pass through a filter of 0.45-µm or finer pore size.

Sample solution: Transfer about 2.5 g of Ginkgo, accurately weighed, to a 30-mL glass centrifuge tube with a screw cap and PTFE gasket. Add 10.0 mL of *Solvent*, seal the tube, and mix well on a vortex mixer. Heat in a water bath at 90° for 30 min. Mix the hot suspension on a vortex mixer, and repeat the heating at 90° for 30 min. Cool, centrifuge, transfer the supernatant to a flask, and return the residue to the glass tube. Repeat the extraction two more times, each time using 10.0 mL of *Solvent*. Combine the extracts, allow them to cool to room temperature, and evaporate to dryness under vacuum in a water bath maintained at 50°. Add 10 mL of *Buffer solution* to the residue, and sonicate for 5 min. Quantitatively transfer the solution to a glass chromatographic tube filled with chromatographic siliceous earth capable of holding 20 mL of aqueous phase.¹ Rinse the beaker with two 5-mL portions of *Buffer solution*, and transfer the washings to the column. [NOTE—Do not exceed 20 mL of total aqueous phase or the holding capacity of the chromatographic tube.]

Allow the *Buffer solution* to be absorbed into the column. After 15 min, elute the column with 100 mL of ethyl acetate, collect the ethyl acetate solution, and evaporate to dryness under vacuum in a water bath maintained at 50°. Dissolve the residue in 10.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

¹ Suitable commercially available material is Extrelut® NT 20 from E Merck Science.

Mode: LC

Detector: Evaporative light-scattering detector.

[NOTE—The parameters of the detector are adjusted to achieve the best signal-to-noise ratio, according to manufacturer recommendations.]

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 25 ± 1°

Flow rate: 1 mL/min

Injection volume: 15 µL

System suitability

Samples: *Standard solutions*

Suitability requirements

Chromatogram similarity: The chromatograms from the *Standard solutions* are similar to the reference chromatogram provided with the lot of USP Ginkgo Terpene Lactones RS being used.

Relative standard deviation: NMT 2.0% determined from the bilobalide peak in repeated injections

Correlation coefficient: NLT 0.995 for the regression line as determined in *Analysis*

Analysis

Samples: *Standard solutions* and *Sample solution*

Record the chromatograms, and identify the peaks of the relevant analytes in the chromatograms of the *Standard solutions* by comparison with the reference chromatogram of the USP Ginkgo Terpene Lactones RS lot being used. Measure the areas of the analyte peaks. Plot the logarithms of the relevant peak responses versus the logarithms of concentrations, in mg/mL, of each analyte from the *Standard solutions*, and determine the regression line using a least-squares analysis.

From the graphs, determine the concentration, *C*, in mg/mL, of the relevant analyte in the *Sample solution*.

Separately calculate the percentages of bilobalide (C₁₅H₁₈O₈), ginkgolide A (C₂₀H₂₄O₉), ginkgolide B (C₂₀H₂₄O₁₀), and ginkgolide C (C₂₀H₂₄O₁₁) in the portion of Ginkgo taken:

$$\text{Result} = (C/W) \times 1000$$

C = concentration of the relevant analyte in the *Sample solution* (mg/mL)

W = weight of Ginkgo taken to prepare the *Sample solution* (mg)

Calculate the total percentage of terpene lactones in the portion of Ginkgo taken by adding the percentages calculated for each analyte.

Acceptance criteria: NLT 0.1% of terpene lactones, calculated as the sum of bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C, on the dried basis

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis (561):** Meets the requirements
- **HEAVY METALS, Method III (231):** NMT 20 µg/g
- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10³ cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: Dried whole, folded, or fragmented leaves, with or without attached petiole, vary from khaki green to greenish brown in color, are often more brown at the apical edge, and darker on the adaxial surface. Lamina are broadly obcordate (fan-shaped), 2–12 cm in width and 2–9.5 cm in length from petiole to apical margin; mostly 1.5–2 times wider than long. The base margins are entire, concave; apical margin sinuate, usually truncate or centrally cleft, and rarely

multiply cleft. The surface is glabrous, with wrinkled appearance due to prominent dichotomous venation appearing parallel and extending from the lamina base to the apical margin. Petioles, similar color to leaf, are channeled on the adaxial surface, and 2–8 cm in length.

Histology

Transverse section of lamina: A thin but marked cuticle occurs over a single layer of epidermal cells on both surfaces. Stomata are present on the lower surface only, with guard cells sunken with respect to adjacent epidermal cells. Palisade elements, elongated, at right angles to the surface and often irregular in appearance, occur just below the upper epidermis. Vascular bundles occur at intervals along the width of the blade, with adjacent cluster crystals of calcium oxalate. Cells of the mesophyll are smaller than the palisade cells, elongated, parallel to the leaf surface, and separated by large intercellular spaces.

Powdered lamina and petiole: Under the microscope, transverse fragments of the leaf display a smooth cuticle, present on both leaf surfaces and staining pinkish orange with sudan III TS. In surface view, cells of the upper epidermis are elongated and wavy-walled, with abundant yellow droplets 2–12 µm in diameter visible in mature and old leaves but not in young leaves. Cells of the lower epidermis are similar in shape but have straighter walls and are interrupted by anisocytic stomata. Numerous lignified elements derived from the lamina and petiole are present, including xylem vessels with annular thickening, tracheids, and vessels with bordered pits. The extent of lignification, particularly in the petiole, increases with age of leaf. Calcium oxalate crystals are numerous, present scattered or associated with vessels, ranging in size from 5–50 µm in young leaves and 15–100 µm in mature leaves. Under crossed polaroids, numerous smaller prism- or tear-shaped shiny features of indeterminate nature may be present. Very occasional, highly elongated, uniseriate, covering trichomes with no obvious cross walls and smooth or warty surfaces may be seen. Mature leaves may show the presence of very rare, polygonal to circular starch granules approximately 20 µm in diameter, with a central hilum and exhibiting a marked Maltese cross under crossed polaroids.

Powdered Ginkgo Extract

DEFINITION

Powdered Ginkgo Extract is prepared from dried and comminuted leaves of Ginkgo extracted with an acetone–water mixture or other suitable solvents. The ratio of the crude plant material to Powdered Extract is between 35:1 and 67:1. It contains NLT 22.0% and NMT 27.0% of flavonoids, calculated as flavonol glycosides, with a mean molecular mass of 756.7, on the dried basis. It contains NLT 5.4% and NMT 12.0% of terpene lactones, consisting of between 2.6% and 5.8% of bilobalide ($C_{15}H_{18}O_8$) and between 2.8% and 6.2% of the sum of ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$), on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Test for flavanoids

Standard solution: A solution of 0.6 mg/mL of USP Rutin RS, and 0.2 mg/mL each of USP Chlorogenic Acid RS and USP Quercetin RS in methanol

Sample solution: 5 mg/mL of Powdered Extract in a mixture of methanol and water (4:1)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μ m (HPTLC plates)

Application volume: 5 μ L

Developing solvent system: Ethyl acetate, water, anhydrous formic acid, and glacial acetic acid (100:26:11:11)

Spray reagent 1: 5 mg/mL of 2-aminoethyl diphenylborinate in methanol

Spray reagent 2: 50 mg/mL of polyethylene glycol 400 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
Before development of the chromatograms, saturate the chamber for 20 min with *Developing solvent system*. Record temperature and humidity in the laboratory. If the relative humidity exceeds 50%, condition the plate to about 35% relative humidity using a suitable device. Apply the samples separately as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), and allow the bands to dry. Develop the plate over a path of 6 cm, remove the plate from the chromatographic chamber, and dry in a circulating air oven at 105° for 5 min. Immediately spray the hot plate with *Spray reagent 1*, then with *Spray reagent 2*, dry, and examine under long-wavelength UV light.

Acceptance criteria: The *Standard solution* shows in its lower part with increasing R_f values a yellowish-brown fluorescent zone due to rutin (R_f 0.28), a light blue fluorescent zone due to chlorogenic acid (R_f 0.36), and a yellow fluorescent zone due to quercetin (R_f 0.92). The *Sample solution* shows a yellowish-brown fluorescent zone, a light blue fluorescent zone, and a yellowish-brown fluorescent zone at R_f similar to those of rutin, chlorogenic acid, and quercetin, respectively, in the *Standard solution*. Additional yellowish to yellowish-green zones due to flavonoids detected in the *Sample solution* chromatogram include one zone below the rutin zone, two zones between the rutin and chlorogenic acid zones, and two zones above the chlorogenic acid zone. Other zones may be seen in the *Sample solution* chromatogram.

- **B. HPLC:** In the test for *Content of Flavonol Glycosides*, the retention times of the peaks for quercetin, isorhamnetin, and kaempferol of the *Sample solution* correspond to those of the *Standard solution*. In the chromatogram of the *Sample solution*, the ratio of the kaempferol peak to the quercetin peak is NLT 0.7, and the peak for isorhamnetin is NLT 0.1 times the size of the quercetin peak.

COMPOSITION

• CONTENT OF FLAVONOL GLYCOSIDES

Extraction solvent: Alcohol, hydrochloric acid, and water (25:4:10)

Mobile phase: Methanol, water, and phosphoric acid (100:100:1)

Standard solution A: 0.125 mg/mL of USP Quercetin RS in methanol

Standard solution B: 0.125 mg/mL of USP Kaempferol RS in methanol

Standard solution C: 0.03 mg/mL of USP Isorhamnetin RS in methanol

Sample solution: Transfer about 0.3 g of Powdered Extract, accurately weighed, to a 250-mL flask fitted with a reflux condenser. Add 78 mL of *Extraction solvent*, and reflux in a hot water bath for 135 min. [NOTE—The solution will turn deep red. The color of the solution is not a definitive indication of reaction completeness.] Allow to cool to room temperature. Transfer to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 370 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *Standard solution C*

[NOTE—The relative retention times for quercetin, kaempferol, and isorhamnetin are about 1.0, 1.8, and 2.0, respectively; *Standard solution A*, *Standard solution B*, and *Standard solution C*.]

Suitability requirements

Relative standard deviation: NMT 2.0% determined from the quercetin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the percentage of each flavonol glycoside in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times F \times 10$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of the relevant analyte from *Standard solution A*, *Standard solution B*, or *Standard solution C*

C_S = concentration of the relevant analyte in *Standard solution A*, *Standard solution B*, or *Standard solution C* (mg/mL)

W = weight of Powdered Extract taken to prepare the *Sample solution* (g)

F = mean molecular mass factor to convert each analyte into flavonol glycoside with a mean molecular mass of 756.7: 2.504 for quercetin, 2.437 for isorhamnetin, and 2.588 for kaempferol

Calculate the total percentage of flavonol glycosides by adding the individual percentages calculated.

Acceptance criteria: 22.0%–27.0% of flavonoids, calculated as flavonol glycosides with a mean molecular mass of 756.7, on the dried basis

• CONTENT OF TERPENE LACTONES

Solvent: Methanol and water (9:1)

Buffer solution: Dissolve 1.19 g of dibasic sodium phosphate and 8.25 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of 5.8.

Diluent: Methanol and water (1:1)
Solution A: Water
Solution B: Methanol
Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
23	52	48
28	52	48
30	25	75
35	10	90
40	75	25
50	75	25

Standard solutions: Using the labeled content of the individual terpene lactones, prepare five solutions of the USP Ginkgo Terpene Lactones RS in *Diluent* within the range of 5–500 µg/mL for each of the relevant terpene lactones. Use sonication to dissolve the analytes if necessary. Pass through a filter of 0.45-µm or finer pore size.

Sample solution: Transfer about 120 mg of Powdered Extract, accurately weighed, to a 25-mL beaker. Add 10 mL of *Buffer solution* to the residue, and sonicate for 5 min. Quantitatively transfer the solution to a glass chromatographic tube filled with chromatographic siliceous earth capable of holding 20 mL of aqueous phase.¹ Rinse the beaker with two 5-mL portions of *Buffer solution*, and transfer the washings to the column. [NOTE—Do not exceed 20 mL of total aqueous phase or the holding capacity of the chromatographic tube.] Allow the *Buffer solution* to be absorbed into the column. After 15 min, elute the column with 100 mL of ethyl acetate, collect the ethyl acetate solution, and evaporate to dryness under vacuum in a water bath maintained at 50°. Dissolve the residue in 20.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering. [NOTE—The parameters of the detector are adjusted to achieve the best signal-to-noise ratio, according to manufacturer recommendations.]

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 25 ± 1°

Flow rate: 1 mL/min

Injection volume: 15 µL

System suitability

Samples: *Standard solutions*

Suitability requirements

Chromatogram similarity: The chromatograms obtained from the *Standard solutions* are similar to the reference chromatogram provided with the lot of USP Ginkgo Terpene Lactones RS being used.

Relative standard deviation: NMT 2.0% determined from the bilobalide peak in repeated injections

Correlation coefficient: NLT 0.995 for the regression line as determined in *Analysis*

Analysis

Samples: *Standard solutions* and *Sample solution*

Record the chromatograms, and identify the peaks of the relevant analytes in the chromatogram of the *Standard solution* by comparison with the reference chromatogram of the USP Ginkgo Terpene Lactones RS lot being used. Measure the areas of the analyte peaks. Plot the logarithms of the relevant peak responses versus the logarithms of concentrations, in mg/mL, of

each analyte of the *Standard solutions*, and determine the regression line using a least-squares analysis. From the graphs, determine the concentration, *C*, in mg/mL, of the relevant analyte in the *Sample solution*. Separately calculate the percentages of bilobalide (C₁₅H₁₈O₈), ginkgolide A (C₂₀H₂₄O₉), ginkgolide B (C₂₀H₂₄O₁₀), and ginkgolide C (C₂₀H₂₄O₁₁) in the portion of Powdered Extract taken:

$$\text{Result} = (C/W) \times 2000$$

C = concentration of the relevant analyte in the *Sample solution* (mg/mL)

W = weight of Powdered Extract taken to prepare the *Sample solution* (mg)

Calculate the total percentage of terpene lactones in the portion of Powdered Extract taken by adding the percentages calculated for each analyte.

Acceptance criteria

Total terpene lactones: 5.4%–12.0%

Bilobalide: 2.6%–5.8%

Sum of ginkgolide A, ginkgolide B, and ginkgolide C: 2.8%–6.2%

CONTAMINANTS

• **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** <561>: Meets the requirements

• **HEAVY METALS, Method II** <231>: NMT 20 µg/g

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10³ cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

LIMIT OF GINKGOLIC ACIDS

Solution A: 0.01% phosphoric acid in water

Solution B: 0.01% phosphoric acid in acetonitrile

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	25	75
6	10	90
7	10	90
8	25	75
10	25	75

Standard solution: Dissolve USP Ginkgolic Acids RS in methanol, and dilute, if necessary, with water to obtain a concentration of 0.25 µg/mL of ginkgolic acids, calculated as the sum of the congeners ginkgolic acid C 13:0, ginkgolic acid C 15:1, and ginkgolic acid C 17:1.

Sample solution: Transfer 0.5 g of Powdered Extract to a 10-mL volumetric flask. Add 8 mL of methanol to dissolve, and dilute with water to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 5-cm; base-deactivated packing L7

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram obtained is similar to the reference chromatogram provided with the lot of USP Ginkgolic Acids RS being used.

¹ Suitable commercially available material is Extrelut® NT 20 from E Merck Science.

Tailing factor: NMT 2.0 for the ginkgolic acid C 15:1 peak

Relative standard deviation: NMT 5.0% for the ginkgolic acid C 15:1 peak in repeated injections

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Identify the peaks of the relevant analytes by comparison with the reference chromatogram of the USP Ginkgolic Acids RS lot being used. If deterioration of peak shapes is observed, wash the column using a mixture of methanol and water (9:1) for 30 min.]

Calculate the concentration, in µg/g, of each ginkgolic acid in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times P \times 10$$

r_U = peak area for the relevant analyte from the *Sample solution*

r_S = peak area for the relevant analyte from the *Standard solution*

C_S = concentration of USP Ginkgolic Acids RS in the *Standard solution* (mg/mL)

W = weight of Powdered Extract taken to prepare the *Sample solution* (mg)

P = content of the relevant ginkgolic acid in USP Ginkgolic Acids RS (µg/g)

Calculate the total amount of ginkgolic acids by adding the individual contents.

Acceptance criteria: NMT 5 µg/g

• Loss on Drying (731)

Sample: 1.0 g of Powdered Extract

Analysis: Dry the *Sample* at 105° for 2 h.

Acceptance criteria: NMT 5.0%

• OTHER REQUIREMENTS: Meets the requirements for *Residual Solvents* in *Botanical Extracts* (565)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, protected from moisture, and store at controlled room temperature.

- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of flavonol glycosides and of terpene lactones, the extracting solvent used for preparation, and the ratio of the starting crude plant material to the Powdered Extract.

USP Rutin RS

Ginkgo Capsules

DEFINITION

Ginkgo Capsules are prepared with Powdered Ginkgo Extract and contain, in the labeled amount of Powdered Extract, NLT 22.0% and NMT 27.0% of flavonol glycosides and NLT 5.4% and NMT 12.0% of terpene lactones, calculated as the sum of bilobalide (C₁₅H₁₈O₈), ginkgolide A (C₂₀H₂₄O₉), ginkgolide B (C₂₀H₂₄O₁₀), and ginkgolide C (C₂₀H₂₄O₁₁).

IDENTIFICATION

- **A. HPLC:** In the test for *Content of Flavonol Glycosides*, the retention times of the peaks for quercetin, isorhamnetin, and kaempferol of the *Sample solution* correspond to

those of the *Standard solution*. In the chromatogram of the *Sample solution*, the ratio of the kaempferol peak to the quercetin peak is NLT 0.7, and the peak for isorhamnetin is NLT 0.1 times the size of the quercetin peak.

- **B. HPLC:** The retention times of the peaks for bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C of the *Sample solution* correspond to those of the *Standard solutions*, as obtained in the test for *Content of Terpene Lactones*.

STRENGTH

• CONTENT OF FLAVONOL GLYCOSIDES

Mobile phase: Methanol, water, and phosphoric acid (100:100:1)

Standard solution A: 0.2 mg/mL of USP Quercetin RS in methanol

Standard solution B: 0.2 mg/mL of USP Kaempferol RS in methanol

Standard solution C: 0.05 mg/mL of USP Isorhamnetin RS in methanol

Sample solution: Weigh and finely powder the contents of NLT 20 Capsules. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of flavonol glycosides, to a 50-mL volumetric flask. Add 20 mL of methanol, and sonicate for 3 min. Add 20 mL of 1.5 N hydrochloric acid, and sonicate again for 10 min. Allow to cool to room temperature, and dilute with methanol to volume. Centrifuge, and transfer a portion of the clear supernatant to a rubber-capped, low-actinic glass vial. Heat in a steam bath for 25 min, and cool to room temperature in an ice bath.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 370 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *Standard solution C*

[NOTE—The relative retention times for quercetin, kaempferol, and isorhamnetin are about 1.0, 1.8, and 2.0, respectively; *Standard solution A*, *Standard solution B*, and *Standard solution C*.]

Suitability requirements

Relative standard deviation: NMT 2.0% determined from the quercetin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the quantity, in mg, of each flavonol glycoside in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times C_S \times F \times 50$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of the relevant analyte from *Standard solution A*, *Standard solution B*, or *Standard solution C*

C_S = concentration of the relevant analyte in *Standard solution A*, *Standard solution B*, or *Standard solution C* (mg/mL)

F = mean molecular mass factor to convert each analyte into flavonol glycoside with a mean molecular mass of 756.7: 2.504 for quercetin, 2.437 for isorhamnetin, and 2.588 for kaempferol

Calculate the total quantity, in mg, of flavonol glycosides in the portion of Capsules taken by adding the individual quantities calculated. Calculate the total quantity, in mg, of flavonol glycosides per Capsule and

the percentage of flavonol glycosides in the labeled amount of Powdered Ginkgo Extract.

Acceptance criteria: 22.0%–27.0% of flavonol glycosides

• **CONTENT OF TERPENE LACTONES**

Solvent: Methanol and water (9:1)

Buffer solution: Dissolve 1.19 g of dibasic sodium phosphate and 8.25 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of 5.8.

Diluent: Methanol and water (1:1)

Solution A: Water

Solution B: Methanol

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
23	52	48
28	52	48
30	25	75
35	10	90
40	75	25
50	75	25

Standard solutions: Using the labeled content of the individual terpene lactones, prepare five solutions of the USP Ginkgo Terpene Lactones RS in *Diluent* within the range of 5–500 µg/mL for each of the relevant terpene lactones. Use sonication to dissolve the analytes if necessary. Pass through a filter of 0.45-µm or finer pore size.

Sample solution: Weigh and finely powder the contents of NLT 20 Capsules. Transfer an accurately weighed quantity of the powder, equivalent to about 120 mg of Powdered Ginkgo Extract, to a 30-mL glass centrifuge tube with a screw cap and PTFE gasket. Add 10.0 mL of *Solvent*, seal the tube, and mix well on a vortex mixer. Heat in a water bath at 90° for 30 min. Mix the hot suspension on a vortex mixer, and repeat the heating at 90° for 30 min. Cool, centrifuge, transfer the supernatant to a flask, and return the residue to the glass tube. Repeat the extraction two more times, each time using 10.0 mL of *Solvent*. Combine the extracts, allow them to cool to room temperature, and evaporate to dryness under vacuum in a water bath maintained at 50°. Add 10 mL of *Buffer solution* to the residue, and sonicate for 5 min. Quantitatively transfer the solution to a glass chromatographic tube filled with chromatographic siliceous earth capable of holding 20 mL of aqueous phase.¹ Rinse the beaker with two 5-mL portions of *Buffer solution*, and transfer the washings to the column. [NOTE—Do not exceed 20 mL of total aqueous phase or the holding capacity of the chromatographic tube.] Allow the *Buffer solution* to be absorbed into the column. After 15 min, elute the column with 100 mL of ethyl acetate, collect the ethyl acetate solution, and evaporate to dryness under vacuum in a water bath maintained at 50°. Dissolve the residue in 20.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering. [NOTE—The parameters of the detector are adjusted to achieve the best signal-to-noise ratio, according to manufacturer recommendations.]

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 25 ± 1°

Flow rate: 1 mL/min

Injection volume: 15 µL

System suitability

Samples: *Standard solutions*

Suitability requirements

Chromatogram similarity: The chromatograms from the *Standard solutions* are similar to the reference chromatogram provided with the lot of USP Ginkgo Terpene Lactones RS being used.

Relative standard deviation: NMT 2.0% determined from the bilobalide peak in repeated injections

Correlation coefficient: NLT 0.995 for the regression line as determined in *Analysis*

Analysis

Samples: *Standard solutions* and *Sample solution*

Record the chromatograms, and identify the peaks of the relevant analytes in the chromatogram of the *Standard solutions* by comparison with the reference chromatogram of the USP Ginkgo Terpene Lactones RS lot being used. Measure the areas of the analyte peaks. Plot the logarithms of the relevant peak responses versus the logarithms of concentrations, in mg/mL, of each analyte obtained from the *Standard solutions*, and determine the regression line using a least-squares analysis.

From the graphs, determine the concentration, *C*, in mg/mL, of the relevant analyte in the *Sample solution*. Separately calculate the quantities, in mg, of bilobalide (C₁₅H₁₈O₈), ginkgolide A (C₂₀H₂₄O₉), ginkgolide B (C₂₀H₂₄O₁₀), and ginkgolide C (C₂₀H₂₄O₁₁) in the portion of Capsules taken:

$$\text{Result} = C \times 20$$

C = concentration of the relevant analyte in the *Sample solution* (mg/mL)

Calculate the total quantity of terpene lactones in the portion of Capsules taken by adding the quantities calculated for each analyte. Calculate the total quantity, in mg, of terpene lactones per Capsule and the percentage of terpene lactones in the labeled amount of Powdered Ginkgo Extract.

Acceptance criteria: 5.4%–12.0% of terpene lactones, calculated as the sum of bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Dissolution*

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 75 rpm

Time: 45 min

Standard solutions: Proceed as directed in the test for *Content of Terpene Lactones*.

Sample solution: Combine 25-mL portions of the solution under test from each of the six dissolution vessels in a separation funnel. Extract with four 50-mL portions of ethyl acetate. Combine the extracts and evaporate in vacuum to dryness. Dissolve the residue with sonication in 5.0 mL of a mixture of water and methanol (1:1).

Analysis: Proceed as directed in the test for *Content of Terpene Lactones* to determine the concentration, *C*, in mg/mL, of ginkgolide B in the *Sample solution*.

Calculate the percentage of ginkgolide B dissolved:

$$\text{Result} = 5000C/3G$$

C = concentration of ginkgolide B in the *Sample solution* (mg/mL)

G = content of ginkgolide B as determined in the test for *Content of Terpene Lactones* (mg/Capsule)

¹ Suitable commercially available material is Extrelut® NT 20 from E Merck Science.

Tolerances: NLT 75% of the content of ginkgolide B is dissolved.

- **WEIGHT VARIATION** (2091): Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the article used to prepare the Capsules. Label the Capsules to indicate the amount, in mg, of Powdered Ginkgo Extract per Capsule.
- **USP REFERENCE STANDARDS** (11)
 - USP Ginkgo Terpene Lactones RS
 - USP Isorhamnetin RS
 - USP Kaempferol RS
 - USP Quercetin RS

Ginkgo Tablets

DEFINITION

Ginkgo Tablets are prepared from Powdered Ginkgo Extract and contain, in the labeled amount of Powdered Extract, NLT 22.0% and NMT 27.0% of flavonol glycosides and NLT 5.4% and NMT 12.0% of terpene lactones, consisting of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$).

IDENTIFICATION

- **A. HPLC:** In the test for *Content of Flavonol Glycosides*, the retention times of the peaks for quercetin, isorhamnetin, and kaempferol of the *Sample solution* correspond to those of the *Standard solution*. In the chromatogram of the *Sample solution*, the ratio of the kaempferol peak to the quercetin peak is NLT 0.7, and the peak for isorhamnetin is NLT 0.1 times the size of the quercetin peak.
- **B. HPLC:** The retention times of the peaks for bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C of the *Sample solution* correspond to those of the *Standard solutions*, as obtained in the test for *Content of Terpene Lactones*.

STRENGTH

• CONTENT OF FLAVONOL GLYCOSIDES

Mobile phase: Methanol, water, and phosphoric acid (100:100:1)

Standard solution A: 0.2 mg/mL of USP Quercetin RS in methanol

Standard solution B: 0.2 mg/mL of USP Kaempferol RS in methanol

Standard solution C: 0.05 mg/mL of USP Isorhamnetin RS in methanol

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of flavonol glycosides, to a 50-mL volumetric flask. Add 20 mL of methanol, and sonicate for 3 min. Add 20 mL of 1.5 N hydrochloric acid, and sonicate again for 10 min. Allow to cool to room temperature, and dilute with methanol to volume. Centrifuge, and transfer a portion of the clear supernatant to a rubber-capped, low-actinic glass vial. Heat in a steam bath for 25 min, and cool to room temperature in an ice bath.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 370 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Samples: *Standard solution A*, *Standard solution B*, and *Standard solution C*

[NOTE—The relative retention times for quercetin, kaempferol, and isorhamnetin are about 1.0, 1.8, and 2.0, respectively; *Standard solution A*, *Standard solution B*, and *Standard solution C*.]

Suitability requirements

Relative standard deviation: NMT 2.0% determined from the quercetin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the quantity, in mg, of each flavonol glycoside in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times C_S \times F \times 50$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of the relevant analyte from *Standard solution A*, *Standard solution B*, or *Standard solution C*

C_S = concentration of the relevant analyte in *Standard solution A*, *Standard solution B*, or *Standard solution C* (mg/mL)

F = mean molecular mass factor to convert each analyte into flavonol glycoside with a mean molecular mass of 756.7: 2.504 for quercetin, 2.437 for isorhamnetin, and 2.588 for kaempferol

Calculate the total quantity, in mg, of flavonol glycosides in the portion of Tablets taken by adding the individual quantities calculated. Calculate the total quantity, in mg, of flavonol glycosides per Tablet and the percentage of flavonol glycosides in the labeled amount of Powdered Ginkgo Extract.

Acceptance criteria: 22.0%–27.0% of flavonol glycosides

• CONTENT OF TERPENE LACTONES

Solvent: Methanol and water (9:1)

Buffer solution: Dissolve 1.19 g of dibasic sodium phosphate and 8.25 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of 5.8.

Diluent: Methanol and water (1:1)

Solution A: Water

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
23	52	48
28	52	48
30	25	75
35	10	90
40	75	25
50	75	25

Standard solutions: Using the labeled content of the individual terpene lactones, prepare five solutions of the USP Ginkgo Terpene Lactones RS in *Diluent* within the range of 5–500 μ g/mL for each of the relevant terpene

lactones. Use sonication to dissolve the analytes if necessary. Pass through a filter of 0.45- μ m or finer pore size.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 120 mg of Powdered Ginkgo Extract, to a 30-mL glass centrifuge tube with a cap and PTFE gasket. Add 10.0 mL of *Solvent*, seal the tube, and mix well on a vortex mixer. Heat in a water bath at 90° for 30 min. Mix the hot suspension on a vortex mixer, and repeat the heating at 90° for 30 min. Cool, centrifuge, transfer the supernatant to a flask, and return the residue to the glass tube. Repeat the extraction two more times, each time using 10.0 mL of *Solvent*. Combine the extracts, allow them to cool to room temperature, and evaporate to dryness under vacuum in a water bath maintained at 50°. Add 10 mL of *Buffer solution* to the residue, and sonicate for 5 min. Quantitatively transfer the solution to a glass chromatographic tube filled with chromatographic siliceous earth capable of holding 20 mL of aqueous phase.¹ Rinse the beaker with two 5-mL portions of *Buffer solution*, and transfer the washings to the column. [NOTE—Do not exceed 20 mL of total aqueous phase or the holding capacity of the chromatographic tube.] Allow the *Buffer solution* to be absorbed into the column. After 15 min, elute the column with 100 mL of ethyl acetate, collect the ethyl acetate solution, and evaporate to dryness under vacuum in a water bath maintained at 50°. Dissolve the residue in 20.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering. [NOTE—The parameters of the detector are adjusted to achieve the best signal-to-noise ratio, according to manufacturer recommendations.]

Column: 4.6-mm \times 25-cm; packing L1

Column temperature: 25 \pm 1°

Flow rate: 1 mL/min

Injection volume: 15 μ L

System suitability

Samples: *Standard solutions*

Suitability requirements

Chromatogram similarity: The chromatograms from the *Standard solutions* are similar to the reference chromatogram provided with the lot of USP Ginkgo Terpene Lactones RS being used.

Relative standard deviation: NMT 2.0% determined from the bilobalide peak in repeated injections

Correlation coefficient: NLT 0.995 for the regression line as determined in *Analysis*

Analysis

Samples: *Standard solutions* and *Sample solution*
Record the chromatograms, and identify the peaks of the relevant analytes in the chromatogram of the *Standard solutions* by comparison with the reference chromatogram of the USP Ginkgo Terpene Lactones RS lot being used. Measure the areas of the analyte peaks. Plot the logarithms of the relevant peak responses versus the logarithms of concentrations, in mg/mL, of each analyte of the *Standard solutions*, and determine the regression line using a least-squares analysis.

From the graphs, determine the concentration, *C*, in mg/mL, of the relevant analyte in the *Sample solution*. Separately calculate the quantities, in mg, of bilobalide (C₁₅H₁₈O₈), ginkgolide A (C₂₀H₂₄O₉), ginkgolide B (C₂₀H₂₄O₁₀), and ginkgolide C (C₂₀H₂₄O₁₁) in the portion of Tablets taken:

$$\text{Result} = C \times 20$$

C = concentration of the relevant analyte in the *Sample solution* (mg/mL)

Calculate the total quantity of terpene lactones in the portion of Tablets taken by adding the quantities calculated for each analyte. Calculate the total quantity, in mg, of terpene lactones per Tablet and the percentage of terpene lactones in the labeled amount of Powdered Ginkgo Extract.

Acceptance criteria: 5.4%–12.0% of terpene lactones, consisting of bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Dissolution*

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 75 rpm

Time: 45 min

Standard solutions: Proceed as directed in the test for *Content of Terpene Lactones*.

Sample solution: Combine 25-mL portions of the solution under test from each of the six dissolution vessels in a separation funnel. Extract with four 50-mL portions of ethyl acetate. Combine the extracts, and evaporate in vacuum to dryness. Dissolve the residue with sonication in 5.0 mL of a mixture of water and methanol (1:1).

Analysis: Proceed as directed in the test for *Content of Terpene Lactones* to determine the concentration, *C*, in mg/mL, of ginkgolide B in the *Sample solution*.

Calculate the percentage of ginkgolide B dissolved:

$$\text{Result} = 5000C/3G$$

C = concentration of ginkgolide B in the *Sample solution* (mg/mL)

G = content of ginkgolide B as determined in the test for *Content of Terpene Lactones* (mg/Tablet)

Tolerances: NLT 75% of the content of ginkgolide B is dissolved.

• **WEIGHT VARIATION** <2091>: Meet the requirements

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10³ cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

• **LABELING:** The label states the Latin binomial and, following the official name, the article used to prepare the Tablets. Label the Tablets to indicate the content, in mg, of Powdered Ginkgo Extract per Tablet.

• **USP REFERENCE STANDARDS** <11>
USP Ginkgo Terpene Lactones RS
USP Isorhamnetin RS
USP Kaempferol RS
USP Quercetin RS

Ginseng, American—see *American Ginseng*

Ginseng, Asian—see *Asian Ginseng*

¹ Suitable commercially available material is Extrelut® NT 20 from E Merck Science.

Ginseng, Siberian—see *Eleuthero***Glucosamine and Chondroitin Sulfate Sodium Tablets****DEFINITION**

Glucosamine and Chondroitin Sulfate Sodium Tablets are prepared from either Glucosamine Hydrochloride, Glucosamine Sulfate Sodium Chloride, Glucosamine Sulfate Potassium Chloride, or a mixture of any of them, with Chondroitin Sulfate Sodium. Tablets contain NLT 90.0% and NMT 120.0% of the labeled amounts of chondroitin sulfate sodium and glucosamine ($C_6H_{13}NO_5$).

[NOTE—Chondroitin Sulfate Sodium is extremely hygroscopic once dried. Avoid exposure to atmosphere, and weigh promptly.]

IDENTIFICATION

- A.** The retention time of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the test for *Content of Glucosamine*.

- B. ELECTROPHORESIS (726)**

Barium acetate buffer: Dissolve 25.24 g of barium acetate in 900 mL of water. Adjust with acetic acid to a pH of 5.0, and dilute with water to 1000 mL.

Staining reagent: 0.1% (w/v) toluidine blue in 0.1 M acetic acid

Standard solution: Use the *Standard solution* of middle concentration from the test for *Content of Chondroitin Sulfate Sodium*.

Sample solution: Prepare as directed in the test for *Content of Chondroitin Sulfate Sodium*.

Analysis: Fill the chambers of an electrophoresis apparatus suitable for separations on cellulose acetate membranes¹ (a small submarine gel chamber or one dedicated to membrane media) with *Barium acetate buffer*. Soak a cellulose acetate membrane 5–6 cm × 12–14 cm in *Barium acetate buffer* for 10 min, or until evenly wetted, then blot dry between two sheets of absorbent paper. Using an applicator² suitable for electrophoresis, apply equal volumes (0.5 µL) of the *Sample solution* and *Standard solution* to the brighter side of the membrane held in position in an appropriate applicator stand or on a separating bridge in the chamber. Ensure that both ends of the membrane are dipped at least 0.5–1.0 cm deep into the buffer chambers. Apply a constant 60 V (6 mA at the start) for 2 h. [NOTE—Perform the application of solutions and voltage within 5 min because further drying of the blotted paper reduces sensitivity.]

Place the membrane in a plastic staining tray, and with the application side down, float or gently immerse in *Staining reagent* for 5 min. Then stir the solution gently for 1 min. Remove the membrane, and destain in 5% acetic acid until the background clears.

Acceptance criteria: The principal spot of the *Sample solution* has the same migration as the principal spot of the *Standard solution*. [NOTE—Document the results by taking a picture within 15 min of completion of destaining.]

STRENGTH**• CONTENT OF GLUCOSAMINE**

Diluent: Transfer 29 µL of acetic acid and 5 mL of acetonitrile to a 100-mL volumetric flask containing 50 mL of water. Dilute with water to volume.

¹ Suitable cellulose acetate membranes for electrophoresis are available from Malta Chemetron SRL, Milano, Italy (www.maltachemetron.com); Fluka Chemical Corp., Milwaukee, WI; and DiaSys Corp., Waterbury, CT (www.diasys.com).

² Suitable applicators are available from DiaSys Corp., Waterbury, CT (www.diasys.com) and Helena Laboratories, Beaumont, TX (www.helena.com).

Borate buffer: 0.2 M (76.3 g/L of sodium borate in water) adjusted with hydrochloric acid TS to a pH of 9.5

Acetate buffer: 6.80 g/L of sodium acetate trihydrate in water adjusted with dilute acetic acid to a pH of 5.9

Derivatizing reagent: In a 14-mL polypropylene culture tube, dissolve 50 mg of o-phthalaldehyde in 1.25 mL of anhydrous methanol. Add 50 µL of 3-mercaptopropionic acid and 11.2 mL of *Borate buffer*, and mix gently. Allow to stand in the dark for 30 min before use. [NOTE—Reagent strength is maintained by adding 10 µL of 3-mercaptopropionic acid every 2 days. Storage should be in the dark at room temperature, and can be used for NMT 2 weeks.]

Mobile phase: Methanol and *Acetate buffer* (1:9)

Standard solution: 1.0 mg/mL of USP Glucosamine Hydrochloride RS in water. Allow to stand at room temperature for 1 h.

Sample solution: Transfer an equivalent to 25 mg of glucosamine, from finely powdered Tablets (NLT 20), to a 25-mL volumetric flask. Dilute with *Diluent* to volume. Mix on a vortex mixer to suspend the powder in solution. Sonicate in a 65° water bath for 20 min. Remove from the bath, stir for 5 min with the aid of a magnetic stirrer, and centrifuge.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 340 nm

Column: 3.0-mm × 5-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Samples: Five individual aliquots of the *Standard solution* derivatized as directed in the *Analysis*. Each derivatized aliquot is injected only once.

[NOTE—The relative retention times for the β-anomer and the α-anomer are 1.0 and 1.8, respectively. The retention time for the β-anomer is NLT 4 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% from five replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*
Transfer 100 µL of the *Derivatizing reagent* and 100 µL of the *Standard solution* or *Sample solution* to a vial containing 400 µL of *Borate buffer*. Allow the derivatization to proceed for 1 min. Inject the derivatized solutions immediately after the derivatization reaction. Calculate the percentage of the labeled amount of glucosamine ($C_6H_{13}NO_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the β-anomer from the derivatized *Sample solution*

r_S = peak response of the β-anomer from the derivatized *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of glucosamine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of glucosamine, 179.17

M_{r2} = molecular weight of glucosamine hydrochloride, 215.63

Acceptance criteria: 90.0%–120.0%

• CONTENT OF CHONDROITIN SULFATE SODIUM

Diluent: Weigh about 297 mg of monobasic potassium phosphate, 492 mg of dibasic potassium phosphate, and 250 mg of polysorbate 80, and transfer into a 1-L beaker. Dissolve in approximately 900 mL of water, and adjust with potassium hydroxide or phosphoric acid to a pH of 7.0 ± 0.2. Dilute with water to 1 L, and mix thoroughly.

Standard solutions: 1.5, 1.0, and 0.5 mg/mL of USP Chondroitin Sulfate Sodium RS in water

Sample solution: Transfer an equivalent to 100 mg of chondroitin sulfate sodium, from finely powdered Tablets (NLT 20), to 60 mL of water. Shake to suspend the powder in solution. Sonicate in a 65° water bath for 20 min. Remove from the bath, and stir or shake for 5 min. Dilute with water to 100 mL, and centrifuge or pass through a suitable filter.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Photometric titration

Titrant: 1 mg/mL of cetylpyridinium chloride in water. Degass before use.

Endpoint detection: Turbidimetric with a photoelectric probe

Analysis

Samples: *Standard solutions* and *Sample solution*

Transfer 5.0 mL of each *Standard solution* and the *Sample solution* to separate titration vessels. Add 25 mL of *Diluent* to each. Stir until a steady reading is obtained with a photoelectric probe either at 420, 550, or 660 nm. Set the instrument to zero in absorbance mode. Titrate with *Titrant* using the photoelectric probe to determine the endpoint turbidimetrically. From a linear regression equation calculated using the volumes of *Titrant* consumed versus concentrations of the *Standard solutions*, determine the concentration of chondroitin sulfate sodium in the *Sample solution*.

Calculate the percentage of the labeled amount of chondroitin sulfate sodium in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

C_U = nominal concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS**

(2040): Meet the requirements for *Dissolution*

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Determine the percentage of the labeled amount of glucosamine (C₆H₁₃NO₅) dissolved by using the following method.

Standard solution: Prepare as directed in the test for *Content of Glucosamine*. Dilute with a suitable quantity of water, if necessary.

Sample solution: Use the solution under test.

Borate buffer, Acetate buffer, Derivatizing reagent, Mobile phase, and Chromatographic system: Proceed as directed in the test for *Content of Glucosamine*.

Analysis: Proceed as directed in the test for *Content of Glucosamine*.

Calculate the percentage of the labeled amount of glucosamine (C₆H₁₃NO₅) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area from the derivatized *Sample solution*

r_S = peak area from the derivatized *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of glucosamine (mg/Tablet)

M_{r1} = molecular weight of glucosamine, 179.17

M_{r2} = molecular weight of glucosamine hydrochloride, 215.63

Tolerances: NLT 75% of the labeled amount of glucosamine (C₆H₁₃NO₅) is dissolved.

Determine the percentage of the labeled amount of chondroitin sulfate sodium dissolved by using the following method.

Standard solutions, Titrant, and Diluent: Proceed as directed in the test for *Content of Chondroitin Sulfate Sodium*.

Sample solution: Use the solution under test.

Analysis: Proceed as directed in the test for *Content of Chondroitin Sulfate Sodium*.

Calculate the percentage of the labeled amount of chondroitin sulfate sodium dissolved:

$$\text{Result} = (C \times V/L) \times 100$$

C = determined concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of chondroitin sulfate sodium (mg/Tablet)

Tolerances: NLT 75% of the labeled amount of chondroitin sulfate sodium is dissolved.

- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS (2091):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label indicates the types of glucosamine salts contained in the article and the species source from which the chondroitin was derived. Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.
- **USP REFERENCE STANDARDS (11)**
USP Chondroitin Sulfate Sodium RS
USP Glucosamine Hydrochloride RS

Glucosamine Hydrochloride

C₆H₁₃NO₅ · HCl

215.63

D-Glucose, 2-amino-2-deoxy-, hydrochloride;
2-Amino-2-deoxy-β-D-glucopyranose hydrochloride
[66-84-2].

DEFINITION

Glucosamine Hydrochloride contains NLT 98.0% and NMT 102.0% of glucosamine hydrochloride (C₆H₁₃NO₅ · HCl), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements
- **C.** The retention time of the glucosamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY**• PROCEDURE**

Buffer: In a 1-L volumetric flask, dissolve 3.5 g of dibasic potassium phosphate in water. Add 0.25 mL of ammonium hydroxide, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Acetonitrile and *Buffer* (75:25)

Diluent: Acetonitrile and water (50:50)

Standard solution: 3.8 mg/mL of USP Glucosamine Hydrochloride RS in *Diluent*

Sample solution: 3.8 mg/mL of Glucosamine Hydrochloride in *Diluent*. [NOTE—Shake by mechanical means to aid dissolution.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 195 nm

Column: 4.6-mm × 15-cm; 5-μm packing L8

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—The peak for the glucosamine moiety elutes at about 10 min. The chromatogram shows a large additional peak near the void volume, due to the chloride ion.]

Suitability requirements

Tailing factor: NMT 2.0 for the glucosamine peak

Efficiency: NLT 1500 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of glucosamine hydrochloride ($C_6H_{13}NO_5 \cdot HCl$) in the portion of Glucosamine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Glucosamine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **CHLORIDE AND SULFATE**, *Sulfate* (221): A 0.10-g portion shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid (NMT 0.24%).
- **ARSENIC**, *Method II* (211): NMT 3 ppm
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* (781S): +70.0° to +73.0°
Sample solution: 25 mg/mL. Measure the specific rotation 3 h after preparation.
- **pH** (791)
Sample solution: 20 mg/mL
Acceptance criteria: 3.0–5.0
- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Glucosamine Hydrochloride RS

Glucosamine Tablets**DEFINITION**

Glucosamine Tablets are prepared from Glucosamine Hydrochloride, Glucosamine Sulfate Sodium Chloride, Glucosamine Sulfate Potassium Chloride, or a mixture of any of them. Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of glucosamine ($C_6H_{13}NO_5$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Glucosamine*.
- **B. IDENTIFICATION TESTS—GENERAL**, *Chloride* (191): Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL**, *Sulfate* (191): Meets the requirements. [NOTE—Only for Tablets labeled as containing glucosamine sodium sulfate or glucosamine potassium sulfate]

STRENGTH**• CONTENT OF GLUCOSAMINE**

Buffer: In a 1-L volumetric flask dissolve 3.5 g of dibasic potassium phosphate in water. Add 0.25 mL of ammonium hydroxide, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Acetonitrile and *Buffer* (75:25)

Diluent: Acetonitrile and water (50:50)

Standard solution: 3.75 mg/mL of USP Glucosamine Hydrochloride RS in *Diluent*

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed portion of the finely powdered material, equivalent to about 312 mg of glucosamine, to a 100-mL volumetric flask. Add 60 mL of *Diluent*, and sonicate for 10 min. Shake by mechanical means for 15 min. Dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a membrane filter of 0.45-μm or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

USP Glucosamine Hydrochloride RS

Glucosamine Sulfate Potassium Chloride

$(C_6H_{14}NO_5)_2SO_4 \cdot 2KCl$ 605.52

Bis(D-glucose, 2-amino-2-deoxy-), sulfate potassium chloride complex;

Bis(2-amino-2-deoxy-β-D-glucopyranose) sulfate potassium chloride complex (–,–) [38899-05-7].

DEFINITION

Glucosamine Sulfate Potassium Chloride contains NLT 98.0% and NMT 102.0% of glucosamine sulfate potassium chloride $[(C_6H_{14}NO_5)_2SO_4 \cdot 2KCl]$, calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION ⟨197K⟩

Sample: Transfer 50 mg of Glucosamine Sulfate Potassium Chloride to a centrifuge tube, and dissolve in 2 mL of water. Add 0.5 mL of barium chloride TS, and centrifuge. Collect the supernatant, and evaporate to dryness. Dry the residue at 105° for 2 h.

Acceptance criteria: The IR spectrum of the *Sample* matches that of a similar preparation of USP Glucosamine Hydrochloride RS, except that the addition of barium chloride TS is omitted.

• B. IDENTIFICATION TESTS—GENERAL, Chloride ⟨191⟩ and Potassium ⟨191⟩: Meets the requirements

• C. The retention time of the glucosamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• D. **SULFATE:** In the test for *Content of Sulfate*, after the addition of barium chloride TS a white precipitate is formed.

ASSAY

• PROCEDURE

Buffer: In a 1-L volumetric flask, dissolve 3.5 g of dibasic potassium phosphate in water, add 0.25 mL of ammonium hydroxide, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Acetonitrile and *Buffer* (75:25)

Diluent: Acetonitrile and water (50:50)

Standard solution: 3.8 mg/mL of USP Glucosamine Hydrochloride RS in *Diluent*. Shake for 5 min by mechanical means to completely dissolve.

Sample solution: Transfer 263 mg of Glucosamine Sulfate Potassium Chloride to a 50-mL volumetric flask. Dissolve in 30 mL of *Diluent*, and shake by mechanical means. Dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 195 nm

Column: 4.6-mm × 15-cm; 5-µm packing L8

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The peak for the glucosamine moiety elutes at about 10 min. The chromatogram shows additional peaks near the void volume, due to the counter ions.]

Suitability requirements

Tailing factor: NMT 2.0 for the glucosamine peak

Efficiency: NLT 1500 theoretical plates

Relative standard deviation: NMT 2.0%.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of glucosamine sulfate potassium chloride $[(C_6H_{14}NO_5)_2SO_4 \cdot 2KCl]$ in the portion of Glucosamine Sulfate Potassium Chloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Glucosamine Sulfate Potassium Chloride in the *Sample solution* (mg/mL)

- M_{r1} = molecular weight of glucosamine sulfate potassium chloride, 605.52
 M_{r2} = twice the molecular weight of glucosamine hydrochloride, 431.26

Acceptance criteria: 98.0%–102.0% on the dried basis

OTHER COMPONENTS

• CONTENT OF SULFATE

Sample: 1 g of Glucosamine Sulfate Potassium Chloride
Analysis: Transfer the *Sample* to a 250-mL beaker, and dissolve in 100 mL of water. Add 4 mL of 6 N hydrochloric acid. Heat the solution to boiling, and add, with constant stirring, sufficient boiling barium chloride TS to completely precipitate the sulfate. Add an additional 2 mL of barium chloride TS, and digest on a steam bath for 1 h. Pass the mixture through ashless filter paper. Transfer the residue quantitatively to a new filter, and wash the residue with hot water until no precipitate is obtained when 1 mL of silver nitrate TS is added to 5 mL of washing. Transfer the paper containing the residue to a tared crucible. Char the paper, without burning, and ignite the crucible and its contents to constant weight. Calculate the content of sulfate by multiplying the weight obtained by 0.4116.

Acceptance criteria: 15.5%–16.5%

IMPURITIES

- **RESIDUE ON IGNITION** (281): 26.5%–31.0%
- **SODIUM:** A solution (1 in 10), tested on a platinum wire, does not impart a pronounced yellow color to a nonluminous flame.
- **ARSENIC, Method II** (211): NMT 3 µg/g
- **HEAVY METALS, Method II** (231): NMT 10 ppm

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S)
Sample solution: 35 mg/mL. Measure the specific rotation 3 h after preparation.
Acceptance criteria: +47.0° to +53.0°
- **PH** (791)
Sample solution: 20 mg/mL
Acceptance criteria: 3.0–5.0
- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
 USP Glucosamine Hydrochloride RS

Glucosamine Sulfate Sodium Chloride

$(C_6H_{14}NO_5)_2SO_4 \cdot 2NaCl$ 573.31
 Bis(D-glucose, 2-amino-2-deoxy-), sulfate sodium chloride complex;
 Bis(2-amino-2-deoxy-β-D-glucopyranose) sulfate sodium chloride complex (–,–) [38899-05-7].

DEFINITION

Glucosamine Sulfate Sodium Chloride contains NLT 98.0% and NMT 102.0% of glucosamine sulfate sodium chloride $[(C_6H_{14}NO_5)_2SO_4 \cdot 2NaCl]$, calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: Transfer 50 mg of Glucosamine Sulfate Sodium Chloride to a centrifuge tube, and dissolve in 2 mL of water. Add 0.5 mL of barium chloride TS, and centrifuge. Collect the supernatant, and evaporate to dryness. Dry the residue at 105° for 2 h.

Acceptance criteria: The IR spectrum of the *Sample* matches that of a similar preparation of USP Glucosa-

mine Hydrochloride RS, except that the addition of barium chloride TS is omitted.

- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191) and **Sodium** (191): Meets the requirements
- **C.** The retention time of the glucosamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **D. SULFATE:** In the test for *Content of Sulfate*, after the addition of barium chloride TS a white precipitate is formed.

ASSAY

• PROCEDURE

Buffer: In a 1-L volumetric flask, dissolve 3.5 g of dibasic potassium phosphate in water, add 0.25 mL of ammonium hydroxide, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Acetonitrile and *Buffer* (75:25)

Diluent: Acetonitrile and water (50:50)

Standard solution: 3.8 mg/mL of USP Glucosamine Hydrochloride RS in *Diluent*. Shake for 5 min by mechanical means to completely dissolve.

Sample solution: Transfer 250 mg of Glucosamine Sulfate Sodium Chloride to a 50-mL volumetric flask. Dissolve in 30 mL of *Diluent*, and shake by mechanical means. Dilute with *Diluent* to volume.

Chromatographic system

 USP Glucosamine Hydrochloride RS

Glucosamine and Methylsulfonylmethane Tablets

DEFINITION

Glucosamine and Methylsulfonylmethane Tablets are prepared from either Glucosamine Hydrochloride, Glucosamine Sulfate Sodium Chloride, Glucosamine Sulfate Potassium Chloride, or a mixture of any of them, with Methylsulfonylmethane. Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of glucosamine ($C_6H_{13}NO_5$) and NLT 90.0% and NMT 110.0% of the labeled amount of methylsulfonylmethane ($C_2H_6O_2S$).

IDENTIFICATION

- **A. PRESENCE OF GLUCOSAMINE:** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Content of Glucosamine*.
- **B. PRESENCE OF METHYLSULFONYLMETHANE:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Content of Methylsulfonylmethane*.

STRENGTH

• CONTENT OF GLUCOSAMINE

Diluent: Transfer 29 µL of acetic acid and 5 mL of acetonitrile to a 100-mL volumetric flask containing 50 mL of water, and dilute with water to volume.

Borate buffer: 0.2 M (76.3 g/L of sodium borate in water) adjusted with hydrochloric acid TS to a pH of 9.5. [NOTE—Buffer must be stored at room temperature. It must be warmed to dissolve if crystallization occurs.]

Acetate buffer: 6.80 g/L of sodium acetate trihydrate in water adjusted with dilute acetic acid to a pH of 5.9

Derivatizing reagent: In a 14-mL polypropylene culture tube dissolve 50 mg of o-phthalaldehyde in

1.25 mL of anhydrous methanol. Add 50 µL of 3-mercaptopropionic acid and 11.2 mL of *Borate buffer*, and mix gently. Allow to stand in the dark for 30 min before use. [NOTE—Reagent strength is maintained by adding 10 µL of 3-mercaptopropionic acid every 2 days. Storage should be in the dark, at room temperature, and can be used for NMT 2 weeks.]

Mobile phase: Methanol and *Acetate buffer* (1:9)

Standard solution: 1.0 mg/mL of USP Glucosamine Hydrochloride RS in water. Allow to stand at room temperature for 1 h.

Sample solution: Transfer an equivalent to 25 mg of glucosamine from NLT 20 Tablets, finely powdered, to a 25-mL volumetric flask, and dilute with *Diluent* to volume. Mix on a vortex mixer to suspend the powder in solution. Sonicate in a 65° water bath for 20 min. Remove from the bath, stir for 5 min with the aid of a magnetic stirrer, and centrifuge.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 340 nm

Column: 3.0-mm × 5-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Samples: Five individual aliquots of the *Standard solution* derivatized as directed for *Analysis*. Each derivatized aliquot is injected only once.

[NOTE—The relative retention times for the β-anomer and the α-anomer are 1.0 and 1.8, respectively. The retention time for the β-anomer is NLT 4 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for five replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*
 Transfer 100 µL of the *Derivatizing reagent* and 100 µL of the *Standard solution* or the *Sample solution* to a vial containing 400 µL of *Borate buffer*. Allow the derivatization to proceed for 1 min. Inject the derivatized solutions immediately after the derivatization reaction. Calculate the percentage of the labeled amount of glucosamine ($C_6H_{13}NO_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the β-anomer from the derivatized *Sample solution*

r_S = peak response of the β-anomer from the derivatized *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of glucosamine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of glucosamine, 179.17

M_{r2} = molecular weight of glucosamine hydrochloride, 215.63

Acceptance criteria: 90.0%–120.0% of the labeled claim

• CONTENT OF METHYLSULFONYLMETHANE

Diluent: Transfer 950 mL of methanol to a 1-L volumetric flask. Add 0.60 mL of diethylene glycol methyl ether, and dilute with methanol to volume.

Standard solution: 0.4 mg/mL of USP Methylsulfonylmethane RS in *Diluent*. Sonicate at 50° for 1 min, and allow to cool to room temperature.

Sample solution: Finely powder NLT 20 Tablets. Dissolve a portion of the finely powdered material, equivalent to 1 Tablet, in *Diluent*, and sonicate for 15 min at 50°. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Quantitatively dilute with *Diluent* to obtain a final concentration of 0.4 mg/mL of methylsulfonylmethane. Transfer 1 mL of the

suspension to a 1.5-mL microcentrifuge tube, and centrifuge for 20 s. Use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm \times 30-m capillary; 5- μ m phase G2 coating

Temperature

Column: 120°

Injector: 250°

Detector: 250°

Carrier gas: Helium

Flow rate: 5 mL/min

Injection size: 1 μ L

Injector type: Split ratio, 2:1

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for the peak response ratio of methylsulfonylmethane to diethylene glycol methyl ether from replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylsulfonylmethane ($C_2H_6O_2S$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of methylsulfonylmethane to diethylene glycol methyl ether from the *Sample solution*

R_S = peak response ratio of methylsulfonylmethane to diethylene glycol methyl ether from the *Standard solution*

C_S = concentration of USP Methylsulfonylmethane RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methylsulfonylmethane in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the label claim

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Dissolution*

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Determine the percentage of glucosamine dissolved as follows.

Standard solution: Prepare as directed in the test for *Content of Glucosamine*. Dilute with a suitable quantity of water, if necessary.

Sample solution: Use the solution under test.

Borate buffer, Acetate buffer, Derivatizing reagent, Mobile phase, Chromatographic system, and

Analysis: Proceed as directed in the test for *Content of Glucosamine*.

Calculate the percentage of the labeled amount of glucosamine ($C_6H_{13}NO_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area obtained from the derivatized *Sample solution*

r_S = peak area obtained from the derivatized *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of glucosamine (mg/Tablet)

M_{r1} = molecular weight of glucosamine, 179.17

M_{r2} = molecular weight of glucosamine hydrochloride, 215.63

Tolerances: NLT 75% of the labeled amount of glucosamine ($C_6H_{13}NO_5$) is dissolved.

- **WEIGHT VARIATION** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label indicates the types of glucosamine salts contained in the article.
- **USP REFERENCE STANDARDS** <11>
 - USP Glucosamine Hydrochloride RS
 - USP Methylsulfonylmethane RS
 - Dimethyl sulfone.
 - $C_2H_6O_2S$ 94.13

Glucosamine, Chondroitin Sulfate Sodium, and Methylsulfonylmethane Tablets

DEFINITION

Glucosamine, Chondroitin Sulfate Sodium, and Methylsulfonylmethane Tablets are prepared from either Glucosamine Hydrochloride, Glucosamine Sulfate Sodium Chloride, Glucosamine Sulfate Potassium Chloride, or a mixture of any of them, with Chondroitin Sulfate Sodium and Methylsulfonylmethane. Tablets contain NLT 90.0% and NMT 120.0% of the labeled amounts of chondroitin sulfate sodium and glucosamine ($C_6H_{13}NO_5$) and NLT 90.0% and NMT 110.0% of the labeled amount of methylsulfonylmethane ($C_2H_6O_2S$).

[NOTE—Chondroitin Sulfate Sodium is extremely hygroscopic once dried. Avoid exposure to atmosphere, and weigh promptly.]

IDENTIFICATION

- **A. PRESENCE OF GLUCOSAMINE:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Glucosamine*.
- **B. PRESENCE OF CHONDROITIN SULFATE** (See *Electrophoresis* <726>.)

Barium acetate buffer: Dissolve 25.24 g of barium acetate in 900 mL of water. Adjust with acetic acid to a pH of 5.0, and dilute with water to 1000 mL.

Staining reagent: 0.1% (w/v) toluidine blue in 0.1 M acetic acid

Standard solution: Use the *Standard solution* of middle concentration from *Content of Chondroitin Sulfate Sodium*.

Sample solution: Prepare as directed in *Content of Chondroitin Sulfate Sodium*.

Analysis: Fill the chambers of an electrophoresis apparatus suitable for separations on cellulose acetate membranes¹ (a small submarine gel chamber or one dedicated to membrane media) with *Barium acetate buffer*. Soak a cellulose acetate membrane 5–6 cm \times 12–14 cm in *Barium acetate buffer* for 10 min, or until evenly wetted, then blot dry between two sheets of absorbent paper. Using an applicator² suitable for electrophoresis, apply equal volumes (0.5 μ L) of the *Sample solution* and *Standard solution* to the brighter side of the membrane held in position in an appropriate applicator stand or on a separating bridge in the chamber. Ensure that both ends of the membrane are dipped at least

¹ Suitable cellulose acetate membranes for electrophoresis are available from Malta Chemetron SRL, Milano, Italy (www.maltachemetron.com); Fluka Chemical Corp., Milwaukee, WI; and DiaSys Corp., Waterbury, CT (www.diasys.com).

² Suitable applicators are available from DiaSys Corp., Waterbury, CT (www.diasys.com) and Helena Laboratories, Beaumont, TX (www.helena.com).

0.5–1.0 cm deep into the buffer chambers. Apply a constant 60 volts (6 mA at the start) for 2 h. [NOTE—Perform the application of solutions and voltage within 5 min because further drying of the blotted paper reduces sensitivity.]

Place the membrane in a plastic staining tray, and with the application side down, float or gently immerse in *Staining reagent* for 5 min. Then stir the solution gently for 1 min. Remove the membrane, and destain in 5% acetic acid until the background clears.

Acceptance criteria: The principal band from the *Sample solution* has the same migration as the principal band from the *Standard solution*. [NOTE—Document the results by taking a picture within 15 min of completion of destaining.]

- **C. PRESENCE OF METHYLSULFONYLMETHANE:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Content of Methylsulfonylmethane*.

STRENGTH

• CONTENT OF GLUCOSAMINE

Diluent: Transfer 29 μ L of acetic acid and 5 mL of acetonitrile to a 100-mL volumetric flask containing 50 mL of water, and dilute with water to volume.

Samples: *Standard solution* and *Sample solution*

Transfer 100 μ L of the *Derivatizing reagent* and 100 μ L of the *Standard solution* or the *Sample solution* to a vial containing 400 μ L of *Borate buffer*, and allow the deriva-

tization to proceed for 1 min. Inject the derivatized solutions immediately after the derivatization reaction. Calculate the percentage of the labeled amount of glucosamine ($C_6H_{13}NO_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the β -anomer from the derivatized *Sample solution*

r_S = peak response of the β -anomer from the derivatized *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of glucosamine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of glucosamine, 179.17

M_{r2} = molecular weight of glucosamine hydrochloride, 215.63

Acceptance criteria: 90.0%–120.0% of the label claim

• CONTENT OF CHONDROITIN SULFATE SODIUM

Standard solutions: 1.5, 1.0, and 0.5 mg/mL of USP Chondroitin Sulfate Sodium RS in water

Sample solution: Transfer an equivalent to 100 mg of chondroitin sulfate sodium from NLT 20 Tablets, finely powdered, to 60 mL of water, and shake to suspend the powder in solution. Sonicate in a 65° water bath for 20 min. Remove from the bath, stir or shake for 5 min, dilute with water to 100 mL, and centrifuge or pass through a suitable filter.

Diluent: Weigh about 297 mg of monobasic potassium phosphate, 492 mg of dibasic potassium phosphate, and 250 mg of polysorbate 80, and transfer into a 1-L beaker. Dissolve in approximately 900 mL of water, and adjust with potassium hydroxide or phosphoric acid to a pH of 7.0 ± 0.2 . Dilute with water to 1 L, and mix thoroughly.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Photometric titration

Titrant: 1 mg/mL of cetylpyridinium chloride in water

Endpoint detection: Turbidimetric with photoelectric probe

Analysis: Transfer 5.0 mL of each *Standard solution* and the *Sample solution* to separate titration vessels, and add 25 mL of *Diluent* to each. Stir until a steady reading is obtained with a photoelectric probe either at 420, 550, or 660 nm. Set the instrument to zero in absorbance mode. Titrate with *Titrant* using the photoelectric probe to determine the endpoint turbidimetrically. From a linear regression equation, calculated using the volumes of *Titrant* consumed versus concentrations of the *Standard solutions*, determine the concentration of chondroitin sulfate sodium in the *Sample solution*. Calculate the percentage of chondroitin sulfate sodium in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

C_U = nominal concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–120.0% of the label claim

• CONTENT OF METHYLSULFONYLMETHANE

Diluent: Transfer 950 mL of methanol to a 1-L volumetric flask. Add 0.60 mL of diethylene glycol methyl ether, and dilute with methanol to volume.

Standard solution: 0.4 mg/mL of USP Methylsulfonylmethane RS in *Diluent*. Sonicate at 50° for 1 min, and allow to cool to room temperature.

Sample solution: Finely powder NLT 20 Tablets. Dissolve a portion of the finely powdered material, equivalent to 1 Tablet, in *Diluent*, and sonicate for 15

min at 50°. Allow to cool to room temperature. Quantitatively dilute with *Diluent* to obtain a final concentration of 0.4 mg/mL of methylsulfonylmethane. Transfer 1 mL of the suspension to a 1.5-mL microcentrifuge tube, and centrifuge for 20 s. Use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary column coated with a 5-μm phase G2

Temperature

Column: 120°

Injector: 250°

Detector: 250°

Carrier gas: Helium

Flow rate: 5 mL/min

Injection size: 1 μL

Injection type: Split ratio, 2:1

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for the peak response ratio of methylsulfonylmethane to diethylene glycol methyl ether from replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylsulfonylmethane (C₂H₆O₂S) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of methylsulfonylmethane to diethylene glycol methyl ether from the *Sample solution*

R_S = peak area ratio of methylsulfonylmethane to diethylene glycol methyl ether from the *Standard solution*

C_S = concentration of USP Methylsulfonylmethane RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methylsulfonylmethane in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the label claim

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Dissolution*

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Determine the percentage of glucosamine dissolved as follows.

Borate buffer, Acetate buffer, Derivatizing reagent, Mobile phase, Chromatographic system, and

Analysis: Proceed as directed in the test for *Content of Glucosamine*.

Standard solution: Prepare as directed in the test for *Content of Glucosamine*. Dilute with a suitable quantity of water, if necessary.

Sample solution: Use the solution under test.

Calculate the percentage of the labeled amount of glucosamine (C₆H₁₃NO₅) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area obtained from the derivatized *Sample solution*

r_S = peak area obtained from the derivatized *Standard solution*

C_S = concentration of USP Glucosamine Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of glucosamine (mg/Tablet)

M_{r1} = molecular weight of glucosamine, 179.17

M_{r2} = molecular weight of glucosamine hydrochloride, 215.63

Tolerances: NLT 75% of the labeled amount of glucosamine (C₆H₁₃NO₅) is dissolved.

Determine the percentage of chondroitin sulfate sodium dissolved as follows.

Titration, Diluent, Standard solutions, and Analysis: Proceed as directed in the test for *Content of Chondroitin Sulfate Sodium*.

Sample solution: Use the solution under test.

Calculate the percentage of the labeled amount of chondroitin sulfate sodium dissolved:

$$\text{Result} = (C \times V/L) \times 100$$

C = determined concentration of chondroitin sulfate sodium in the *Sample solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of chondroitin sulfate sodium (mg/Tablet)

Tolerances: NLT 75% of the labeled amount of chondroitin sulfate sodium is dissolved.

- **WEIGHT VARIATION** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **LABELING:** The label indicates the types of glucosamine salts contained in the article and the species source from which chondroitin was derived. Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.

- **USP REFERENCE STANDARDS** <11>

C₂H₆O₂S 94.13

Glutamic Acid

C₅H₉NO₄

L-Glutamic acid;

S-2-Aminopentanedioic acid [56-86-0].

147.13

DEFINITION

Glutamic Acid contains NLT 98.5% and NMT 101.5% of L-glutamic acid (C₅H₉NO₄), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

ASSAY

- **PROCEDURE**

Sample: 140 mg of Glutamic Acid

Blank: Mix 6 mL of formic acid and 50 mL of glacial acetic acid.

Titrimetric system(See *Titrimetry* <541>.)**Mode:** Direct titration**Titrant:** 0.1 N perchloric acid VS**Endpoint detection:** Potentiometric

Analysis: Dissolve the *Sample* in 6 mL of formic acid and 50 mL of glacial acetic acid, and titrate with the *Titrant*. Perform the *Blank* determination. Calculate the percentage of glutamic acid (C₅H₉NO₄) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = volume of *Titrant* consumed by the *Sample* (mL)

V_B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 147.1 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **CHLORIDE AND SULFATE**, *Chloride* <221>

Standard solution: 0.40 mL of 0.010 N hydrochloric acid

Sample: 0.7 g of Glutamic Acid

Acceptance criteria: NMT 0.02%

• **CHLORIDE AND SULFATE**, *Sulfate* <221>

Standard solution: 0.25 mL of 0.020 N sulfuric acid

Sample: 1.2 g of Glutamic Acid

Acceptance criteria: NMT 0.02%

• **IRON** <241>: NMT 10 µg/g

• **HEAVY METALS**, *Method 1* <231>: NMT 10 µg/g

RELATED COMPOUNDS

Standard solution: 0.05 mg/mL of USP Glutamic Acid RS in water

Sample solution: 10 mg/mL in a solution of ammonia TS and water (1:1)

System suitability solution: 0.4 mg/mL each of USP Aspartic Acid RS and USP Glutamic Acid RS in water

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 µL

Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)

Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

System suitability

Suitability requirements: The chromatogram from the *System suitability solution* exhibits two clearly separated spots.

Analysis: After air-drying the plate, repeat the development process. After air-drying a second time, spray with *Spray reagent*, and heat between 100° and 105° for about 15 min. Examine the plate under white light.

Acceptance criteria: Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.

Individual impurities: NMT 0.5%

Total impurities: NMT 2.0%

SPECIFIC TESTS

• **OPTICAL ROTATION**, *Specific Rotation* <781S>

Sample solution: 100 mg/mL in 2 N hydrochloric acid

Analysis: Proceed as directed in the chapter, except measure at 20°.

Acceptance criteria: +31.5° to +32.5°

• **LOSS ON DRYING** <731>: Dry a sample at 105° for 3 h: it loses NMT 0.1% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

Organic Impurities

PROCEDURE

Mobile phase: 6.8 g/L of potassium dihydrogen phosphate with 2.02 g/L of sodium 1-heptane sulfonate. Adjust with phosphoric acid to a pH of 3.0. Mix 970 mL of this solution with 30 mL of methanol.

System suitability solution: 0.1 mg/mL of USP L-Phenylalanine RS, 0.5 mg/mL of USP Glutathione RS, and 0.5 mg/mL of USP Ascorbic acid RS in *Mobile phase*.

Standard solution: 0.01 mg/mL of USP Glutathione RS in *Mobile phase*. [NOTE—This solution has a concentration equivalent to 2.0% of that of the *Sample solution*.]

Sample solution: 50 mg of glutathione in 100 mL of *Mobile phase*. [NOTE—Allow the solution to stand for 5 min before use.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: Adjust so that the retention time of glutathione is about 5 min.

Injection size: 10 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 5.0 between the ascorbic acid and glutathione peaks; and NLT 5.0 between the glutathione and L-phenylalanine peaks

Relative standard deviation: NMT 1.5% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any impurity in the portion of Glutathione taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any peak from the *Sample solution* other than glutathione

r_S = peak response of the glutathione peak from the *Standard solution*

C_S = concentration of USP Glutathione RS in the *Standard solution* (mg/mL)

C_U = concentration of Glutathione in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurity: NMT 1.5% for the impurity with the relative retention time of about 4

Total impurities: NMT 2.0%

SPECIFIC TESTS

CLARITY AND COLOR OF SOLUTION

Sample solution: 0.1 g/mL in water

Analysis: Using identical tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, compare the liquid to be examined with

water, the depth of the layer being 40 mm. Compare the colors in diffused daylight, viewing vertically against a white background.

Acceptance criteria: The solution is clear and colorless.

- **LOSS ON DRYING** (731): NMT 0.5%, 105° for 3 h

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

USP Ascorbic Acid RS

USP Glutathione RS

USP L-Phenylalanine RS

Glycine—see *Glycine General Monographs*

Goldenseal

DEFINITION

Goldenseal consists of the dried roots and rhizomes of *Hydrastis canadensis* L. (Fam. Ranunculaceae). It contains NLT 2.0% of hydrastine ($C_{21}H_{21}NO_6$) and NLT 2.5% of berberine ($C_{20}H_{18}NO_4$), calculated on the dried basis.

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 0.5 mg/mL each of USP Berberine Chloride RS and USP Hydrastine RS in methanol

Sample solution: Finely powder the rhizome and the root. Transfer 0.5 g of the powder to a suitable glass vial, and add 0.5 mL of 10% sodium carbonate. Add 5 mL of methanol, and heat for 10 min in a water bath at 60°. Cool to room temperature, filter, and dry under a stream of nitrogen. Add 0.5 mL of methanol to dissolve the residue.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10–20 μL, as bands

Developing solvent system: Ethyl acetate, butyl alcohol, formic acid, and water (5:3:1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved about three-fourths of the length of the plate, in a saturated chamber. Remove the plate, air-dry, and examine under UV light at 365 nm.

Acceptance criteria: The chromatograms show zones having a lemon-yellow fluorescence due to berberine at an R_f value of about 0.53 and a blue-white fluorescence due to hydrastine at an R_f value of about 0.42.

COMPOSITION

CONTENT OF BERBERINE AND HYDRASTINE AND LIMIT OF PALMATINE

Mobile phase: Dissolve 9.93 g of monobasic potassium phosphate in 730 mL of water, add 270 mL of acetonitrile, mix, filter, and degas.

Solvent: A mixture of 0.1 M monobasic potassium phosphate and acetonitrile (60:40)

Standard solution: 0.05 mg/mL each of USP Berberine Chloride RS and USP Hydrastine RS in a mixture of methanol and water (1:1)

System suitability solution: Prepare a solution of palmatine in a mixture of water and methanol (1:1) having a known concentration of about 0.05 mg/mL. Mix equal volumes of this solution and the *Standard solution*.

Sample solution: Finely powder a quantity of Goldenseal, and transfer about 0.12 g, accurately weighed, to a 50-mL volumetric flask. Add 40 mL of *Solvent*, soni-

cate for 5 min, and shake for 10 min. Dilute with *Solvent* to volume, mix, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 150-mm; packing L1

Flow rate: 1.8 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between the berberine and palmatine peaks, and NLT 1.5 between the hydrastine and palmatine peaks, *System suitability solution*

Capacity factor: NLT 3.0, determined from the hydrastine and berberine peaks, *Standard solution*

Column efficiency: NLT 5000 theoretical plates determined from the hydrastine and berberine peaks, *Standard solution*

Tailing factor: NMT 2.0 determined from the hydrastine and berberine peaks, *Standard solution*

Relative standard deviation: NMT 2.5% determined from the hydrastine and berberine peaks in repeated injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of berberine and hydrastine in the portion of Goldenseal taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area of berberine or hydrastine from the *Sample solution*

r_S = peak area of berberine or hydrastine from the *Standard solution*

C_S = concentration of berberine or hydrastine in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of powdered Goldenseal used to prepare the *Sample solution* (mg)

Using the values obtained from the chromatogram of the *Sample solution*, divide the peak area of berberine by the peak area of any peak at the locus for palmatine (if present).

Acceptance criteria: NLT 2.0% of hydrastine ($C_{21}H_{21}NO_6$) and NLT 2.5% of berberine ($C_{20}H_{18}NO_4$), on the dried basis. The ratio of the berberine peak area to any peak area at the locus for palmatine is more than 50:1.

CONTAMINANTS

- **HEAVY METALS,** *Method III* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN,** *General Method for Pesticide Residues Analysis* <561>: Meets the requirements

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: The rhizome is knotty, subcylindrical, and occasionally has an aerial stem. It is 1–5 cm in length and 2–10 mm in diameter. Externally, the rhizome is brown to dusky yellowish orange, deeply furrowed, and marked by numerous stem and bud scale scars. Numerous brittle roots arise roughly from the same side of the main axis. Fractures are short and resinous, with a dark yellow to yellowish-brown bark, greenish-yellow margins, and a yellowish-orange center that is waxy in appearance. An interrupted circle of small, radially elongated fibrovascular bundles are also present. The roots are filiform, up to 35 cm in length and 1 mm in diameter, and are either curved or twisted, tangled together, or broken. Fractures are short and brittle, and show an internal color of yellowish orange to greenish yellow.

Histology

Transverse section of rhizome and root: The rhizome has polygonal, yellowish-brown, thin- to slightly thick-walled cork cells. Wedge-shaped vascular bundles are separated by wide medullary rays. Tracheary elements are lignified and have slit-shaped pits. A few large vessels with reticulate thickenings are also present. The parenchyma tissue is composed of polygonal cells with abundant simple or compound starch grains up to 8 µm in diameter. A few irregularly shaped resin cells are present in the cortex and the pith. Masses of granular, orange-brown matter are also present in the parenchyma tissues. The roots have a single layer of irregularly elongated cork cells. The tracheary elements are associated with lignified fibers. Fragments of the epidermis are sometimes present near the base of the rhizome and are composed of cells with thick, lignified, beaded walls.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** <561>: NMT 2.0%
- **LOSS ON DRYING** <731>: Dry 2 g of finely powdered Goldenseal at 100° for 5 h: it loses NMT 12.0% of its weight.

Calculate the percentages of berberine and hydrastine in the portion of Powdered Goldenseal taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area of berberine or hydrastine from the *Sample solution*

r_S = peak area of berberine or hydrastine from the *Standard solution*

C_S = concentration of berberine or hydrastine in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Goldenseal used to prepare the *Sample solution* (mg)

Using the values from the chromatogram of the *Sample solution*, divide the peak area of berberine by the peak area of any peak at the locus for palmatine (if present).

Acceptance criteria: NLT 2.0% of hydrastine ($C_{21}H_{21}NO_6$) and NLT 2.5% of berberine ($C_{20}H_{18}NO_4$), on the dried basis. The ratio of the berberine peak area to any peak area at the locus for palmatine is more than 50:1.

CONTAMINANTS

- **HEAVY METALS, Method III** <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis** <561>: Meets the requirements

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** The powder is dark yellow to moderately greenish yellow with an aromatic odor and bitter taste. Abundant starch granules are present and are either spherical or ovoid; the granules are simple or compounded, with an occasional slit-shaped hilum. Parenchyma cells range from polygonal to round and are filled with starch or brown resin. Tracheary elements with slit-shaped pits and a few large reticulated vessels are present, as are beaded, thick-walled elongated epidermal cells. Thin fragments of cork layer are also present.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** <561>: NMT 2.0%

- **LOSS ON DRYING** <731>: Dry 2 g of Powdered Goldenseal at 100° for 5 h: it loses NMT 12.0% of its weight.

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 9%

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** <561>: NMT 5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store protected from light and moisture.

- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

- **USP REFERENCE STANDARDS** <11>

USP Berberine Chloride RS

USP Hydrastine RS

Powdered Goldenseal Extract

DEFINITION

Powdered Goldenseal Extract is prepared from the pulverized dried roots and rhizomes of *Hydrastis canadensis* L. (Fam. Ranunculaceae), using suitable solvents. It contains NLT 5% of hydrastine ($C_{21}H_{21}NO_6$) and NLT 10% of the sum of berberine ($C_{20}H_{18}NO_4$) and hydrastine, calculated on the dried basis. The ratio of starting crude plant material to Powdered Extract is 2:1.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.5 mg/mL each of USP Berberine Chloride RS and USP Hydrastine RS in methanol

Sample solution: 10 mg/mL of Powdered Extract in a mixture of methanol and water (1:1). Sonicate for 20 min, cool to room temperature, and filter.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10–20 µL, as bands

Developing solvent system: Ethyl acetate, butyl alcohol, formic acid, and water (5:3:1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved about three-fourths of the length of the plate, in a saturated chamber. Remove the plate, air-dry, and examine under UV light at 365 nm.

Acceptance criteria: The chromatograms show zones having a lemon-yellow fluorescence due to berberine at an R_f value of about 0.53 and a blue-white fluorescence due to hydrastine at an R_f value of about 0.42.

COMPOSITION**• CONTENT OF BERBERINE AND HYDRASTINE AND LIMIT OF PALMATINE**

Mobile phase: Dissolve 9.93 g of monobasic potassium phosphate in 730 mL of water, add 270 mL of acetonitrile, mix, filter, and degas.

Standard solution: 0.05 mg/mL each of USP Berberine Chloride RS and USP Hydrastine RS in a mixture of methanol and water (1:1)

System suitability solution: Prepare a solution of palmatine in a mixture of water and methanol (1:1) having a known concentration of about 0.05 mg/mL. Mix equal volumes of this solution and the *Standard solution*.

Sample solution: 2 mg/mL of Powdered Extract in a mixture of methanol and water (1:1). Sonicate for 20 min, cool to room temperature, and filter. [NOTE—The sample to be used in this test should not be subjected to the conditions specified in the test for *Loss on Drying*. A separate sample is used to determine the content on the dried basis.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 150-mm; packing L1

Flow rate: 1.8 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between the berberine and palmatine peaks, and NLT 1.5 between the hydrastine and palmatine peaks, *System suitability solution*

Capacity factor: NLT 3.0, determined from the hydrastine and berberine peaks, *Standard solution*

Column efficiency: NLT 5000 theoretical plates determined from the hydrastine and berberine peaks, *Standard solution*

Tailing factor: NMT 2.0 determined from the hydrastine and berberine peaks, *Standard solution*

Relative standard deviation: NMT 2.5% determined from the hydrastine and berberine peaks in repeated injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of hydrastine and berberine in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of berberine or hydrastine from the *Sample solution*

r_S = peak area of berberine or hydrastine from the *Standard solution*

C_S = concentration of berberine or hydrastine in the *Standard solution* (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Using the values from the chromatogram of the *Sample solution*, divide the peak area of berberine by the peak area of any peak at the locus for palmatine (if present).

Acceptance criteria: NLT 5% of hydrastine and NLT 10% of the sum of hydrastine and berberine, on the dried basis. The ratio of the berberine peak area to any peak area at the locus for palmatine is more than 50:1.

CONTAMINANTS

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 1000 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry 1.0 g of Powdered Extract at 105° for 2 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store protected from light and moisture.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. Label to indicate the content of hydrastine and berberine, the extracting solvent used for preparation, and the ratio of the starting crude plant material to the Powdered Extract.
- **USP REFERENCE STANDARDS** <11>
 - USP Berberine Chloride RS
 - USP Hydrastine RS

Grape Seeds Oligomeric Proanthocyanidins

DEFINITION

Grape Seeds Oligomeric Proanthocyanidins is a fraction of an extract of the ripe seeds of *Vitis vinifera* L. (Fam. Vitaceae). It contains NLT 75.0% of oligomeric proanthocyanidins, on the anhydrous basis. The extract is prepared using suitable solvents such as alcohol, methanol, acetone, ethyl acetate, water, or mixtures of these solvents, in a ratio of starting plant material to extract between 70:1 and 10:1. The extract is further enriched in oligomeric proanthocyanidins by fractionation with ethyl acetate or by other means.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Adsorbent: Chromatographic silica gel with an average particle size of 5 µm and a layer thickness of about 0.2 mm (HPTLC plates)

Standard solution A: Dissolve a quantity of USP Purified Grape Seeds Oligomeric Proanthocyanidins RS in methanol, using sonication, to obtain a solution having a concentration of about 5 mg/mL. Centrifuge if necessary, and use the clear supernatant. [NOTE—Prepare fresh.]

Standard solution B: Dissolve a quantity of USP (+)-Catechin RS in methanol, using sonication, to obtain a solution having a concentration of about 1 mg/mL.

Sample solution: Proceed as directed for *Standard solution A*, except use the Grape Seeds Oligomeric Proanthocyanidins.

Developing solvent system: A mixture of acetone, toluene, and formic acid (15:15:5)

Spray reagent: Dissolve about 100 mg of vanillin in 3-mL of methanol using sonication. Add about 3 mL of hydrochloric acid, dilute with methanol to 10 mL, and carefully mix under cold water. [NOTE—Prepare fresh.]

Application volume: 15 µL, as 5–10-mm bands

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable thin-layer chromatographic plate (see *Chromatography* <621>). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, dry, and examine under visible light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits pink-violet bands, corresponding in color and R_f to those in the chromatogram of *Standard solution A*, at the following approximate R_f values: a pair of bands between 0.20 and 0.23 (trimeric proanthocyanidins), a band at 0.28 (proanthocyanidin-B₂-3'-O-gallate), a band at 0.31 (B-type dimeric proanthocyanidins), and a band at 0.43 ((-)-epicat-

echin-3-O-gallate). The chromatogram of the *Sample solution* may exhibit a pink-violet band at an approximate R_f of 0.49 (residual flavan 3-ol monomers and/or gallic acid) corresponding to the band in the chromatogram of *Standard solution B*. Other pink-violet bands may also be observed.

- **B.** The chromatogram of the *Sample solution* obtained in the test for *Limit of Catechin and Epicatechin* exhibits peaks due to proanthocyanidin dimer B₁, proanthocyanidin dimer B₂, (–)-epicatechin-3-O-gallate, and a broad peak due to other oligomeric proanthocyanidins at retention times corresponding to those in the chromatogram of *Standard solution B*.

COMPOSITION

• CONTENT OF OLIGOMERIC PROANTHOCYANIDINS

Internal standard solution: Prepare a solution of butylated hydroxytoluene in *Mobile phase* containing about 0.3 mg/mL.

Standard solution A: Dissolve a weighed quantity of USP Purified Grape Seeds Oligomeric Proanthocyanidins RS in *Internal standard solution* to obtain a solution having a known concentration of about 1.0 mg/mL.

Standard solution B: Dissolve a portion of USP (+)-Catechin RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.2 mg/mL.

Sample solution: Dissolve a weighed quantity of Grape Seeds Oligomeric Proanthocyanidins in *Internal standard solution* to obtain a solution having a known concentration of about 1.0 mg/mL. Centrifuge, and use the clear supernatant.

Mobile phase: Prepare a filtered and degassed mixture of tetrahydrofuran and an aqueous solution of lithium bromide (about 1 mg/mL) (95:5).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 7.5-mm × 30-cm; 5-μm, 500-Å, packing L21

Column temperature: 25° ± 1

Flow rate: 1.0 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements: Measure the responses as determined under *Analysis*.

Relative standard deviation: NMT 2.0% determined from the the peak area ratio of the oligomeric proanthocyanidins to the internal standard in repeated injections, *Standard solution A*

Resolution: NLT 3.0 between the peaks of monomers and the internal standard, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Chromatograph *Standard solution A* and determine the beginning and end of the retention time window for the integration of oligomeric proanthocyanidins, at the points where the response of the main peak is about 0.5% of its maximum. Record the peak area ratio of the oligomeric proanthocyanidins to the internal standard. Chromatograph *Standard solution B* and the *Sample solution* and identify the locus for the monomers. Integrate the areas of the main peaks within the retention time window as determined for *Standard solution A*, excluding the area above the main peak, at the locus identified for the monomers, using a proper integration method.

Calculate the percentage of the oligomeric proanthocyanidins in the portion of the Grape Seeds Oligomeric Proanthocyanidins taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of the oligomeric proanthocyanidins to the internal standard from the *Sample solution*

R_S = peak response ratio of the oligomeric proanthocyanidins to the internal standard from *Standard solution A*

C_S = concentration of USP Purified Grape Seeds Oligomeric Proanthocyanidins RS in *Standard solution A* (mg/mL)

C_U = concentration of Grape Seeds Oligomeric Proanthocyanidins in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 75.0% on the anhydrous basis

IMPURITIES

Inorganic Impurities

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

Organic Impurities

- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS

• LIMIT OF CATECHIN AND EPICATECHIN

Solution A: Use acetonitrile.

Solution B: Use a 0.3% aqueous solution of 85% phosphoric acid.

Solvent: Prepare a mixture of *Solution A* and *Solution B* (1:9).

Standard solution A: Dissolve, using sonication, a weighed quantity of USP (+)-Catechin RS in *Solvent* to obtain a solution having a known concentration of about 0.5 mg/mL.

Standard solution B: Dissolve, using sonication, a weighed quantity of USP Grape Seeds Oligomeric Proanthocyanidins RS in *Solvent* to obtain a solution having a known concentration of about 5 mg/mL. Centrifuge, and use the clear supernatant.

Sample solution: Proceed as directed for *Standard solution B*, except use the Grape Seeds Oligomeric Proanthocyanidins.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	10	90
45	20	80
65	60	40
66	10	90
85	10	90

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 0.7 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

The chromatogram obtained from *Standard solution B* is similar to the Reference Chromatogram provided with the lot of the USP Grape Seeds Oligomeric Proanthocyanidins RS being used.

Tailing factor: NMT 2.0 for the catechin peak, *Standard solution A*

Relative standard deviation: NMT 2% determined from the catechin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution A*, *Standard solution B*, and the Reference Chromatogram provided with the lot of USP Grape Seeds Oligomeric Proanthocyanidins RS being used, identify the retention times of the peaks corresponding to (+)-catechin and (–)-epicatechin. The approximate relative retention times of the peaks are 1.0 and 1.43 for (+)-catechin and (–)-epicatechin, respectively. Calculate the sum of the percentages of (+)-catechin and (–)-epicatechin in the portion of the Grape Seeds Oligomeric Proanthocyanidins taken:

$$(r_U/r_S) \times (C \times V/W) \times 100$$

- r_U = sum of the peak responses for (+)-catechin and (–)-epicatechin from the *Sample solution*
 r_S = peak response for (+)-catechin in *Standard solution A*
 C_S = concentration of USP (+)-Catechin RS in *Standard solution A* (mg/mL)
 V = final volume of the *Sample solution* (mL)
 W = weight of Grape Seeds Oligomeric Proanthocyanidins taken to prepare the *Sample solution* (mg)

Acceptance criteria: NMT 19.0% on the anhydrous basis

- MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 10^4 cfu/g. The total combined yeast and mold count does not exceed 10^3 cfu/g.
- ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- RESIDUE ON IGNITION (281):** NMT 0.5%, determined on 5.0 g
- WATER, Method 1a (921):** NMT 8.0%
- WATER-INSOLUBLE FRACTION**

Analysis: Transfer about 1 g, weighed, to a suitable flask. Add 100 mL of water, and shake vigorously for 15 min. Pass the solution through a previously tared sintered-glass filter, wash the flask with 30 mL of water, and transfer the washings to the filter. Wash the filter with 30 mL of water in 5-mL portions. Dry the filter for 2 h at 105°, cool in a desiccator, and weigh. Calculate the percentage of the water-insoluble fraction.

Acceptance criteria: NMT 2%

- OTHER REQUIREMENTS:** It meets the requirements of the test for *Residual Solvents* under *Botanical Extracts* (565).

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.
- LABELING:** The label states the Latin binomial and, following the official name, it states "Grape Seeds Oligomeric Proanthocyanidins". It meets other labeling requirements under *Botanical Extracts* (565).
- USP REFERENCE STANDARDS (11)**
 USP (+)-Catechin RS
 USP Grape Seeds Oligomeric Proanthocyanidins RS
 USP Purified Grape Seeds Oligomeric Proanthocyanidins RS

Powdered Decaffeinated Green Tea Extract

DEFINITION

Powdered Decaffeinated Green Tea Extract is prepared from the young, unfermented leaf and leaf buds of *Camellia sinensis* (L.) Kuntze (Fam. Theaceae), also known as *Thea sinensis* L., using suitable solvents such as alcohol, metha-

anol, acetone, or water or mixtures of these solvents; the caffeine has been removed. The ratio of the starting crude plant material to Powdered Extract is 6:1–10:1. It contains NLT 60.0% of polyphenols, calculated as (–)-epigallocatechin-3-O-gallate, NLT 40.0% of (–)-epigallocatechin-3-O-gallate, and NMT 0.1% of caffeine, calculated on the anhydrous basis.

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 4 mg/mL of USP Powdered Decaffeinated Green Tea Extract RS in a mixture of alcohol and water (4:1), sonicate for 10 min, and centrifuge. Use the clear supernatant. [NOTE—Prepare fresh. Store below –20°, if storage is needed.]

Sample solution: 4 mg/mL of Powdered Decaffeinated Green Tea Extract in a mixture of alcohol and water (4:1), sonicate for 10 min, and centrifuge. Use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: Use a chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates).

Application volume: 1 µL

Developing solvent system: Toluene, acetone, and formic acid (9:9:2)

Immersion reagent: Dissolve 140 mg of fast blue B salt in 10 mL of water, and add 140 mL of methanol and 50 mL of dichloromethane. [NOTE—Prepare weekly, and store at 4° in the dark.]

Analysis

Samples: *Standard solution* and *Sample solution*
 Use an unsaturated chamber, and condition the plate to a relative humidity of 30% using a suitable device. Develop the chromatograms, dry the plate at 100°, dip in the *Immersion reagent*, dry, and immediately examine the plate under visible light. [NOTE—The chromatogram is stable up to 30 min; afterward, the plate's background darkens significantly.]

Acceptance criteria: The chromatogram of the *Sample solution* exhibits main bands similar in position and color to the main bands in the chromatogram of the *Standard solution*. The chromatogram of the *Sample solution* exhibits four main brownish orange bands with R_f values of approximately 0.38, 0.48, 0.52, and 0.62 corresponding to (–)-epigallocatechin-3-O-gallate, (–)-epigallocatechin, (–)-epicatechin-3-O-gallate, and (–)-epicatechin, respectively. The most intense band is the one for (–)-epigallocatechin-3-O-gallate. The least intense band is the one for (–)-epicatechin.

B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Polyphenols*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for (–)-epigallocatechin, (+)-catechin, (–)-epicatechin, (–)-epigallocatechin-3-O-gallate, (–)-gallocatechin-3-O-gallate, (–)-epigallocatechin-3-O-(3'-O-methyl)-gallate, and (–)-epicatechin-3-O-gallate at retention times corresponding to those in the chromatogram of *Standard solution B*.

COMPOSITION

C. CONTENT OF POLYPHENOLS

Solution A: Methanol, phosphoric acid 85%, and water (50:3.5:946.5)

Solution B: Acetonitrile and methanol (95:5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	94	6
20	94	6
50	78	22

Table 1 (Continued)

Time (min)	Solution A (%)	Solution B (%)
70	38	62
75	94	6
90	94	6

Standard solution A: 0.1 mg/mL of USP (–)-Epigallocatechin-3-O-gallate RS in *Solution A*

Standard solution B: 0.4 mg/mL of USP Powdered Decaffeinated Green Tea Extract RS in *Solution A*. Mix, and centrifuge.

Sample solution: 0.4 mg/mL of Powdered Decaffeinated Green Tea Extract in *Solution A*. Mix, and centrifuge.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm 6 25-cm; 5-μm packing L1

Column temperature: 25 ± 1°

Flow rate: 0.8 mL/min

Injection size: 15 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Decaffeinated Green Tea Extract RS being used.

Resolution: NLT 1 between the (–)-epigallocatechin-3-O-gallate peak and the preceding peak, *Standard solution B*

Tailing factor: 0.8–2.0 for the (–)-epigallocatechin-3-O-gallate peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the (–)-epigallocatechin-3-O-gallate peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Record the chromatograms, and measure the areas of the analyte peaks. Using the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Decaffeinated Green Tea Extract RS, identify the retention times of the peaks corresponding to the different polyphenols. The approximate relative retention times of the polyphenols are provided in *Table 2*.

Table 2

Analyte	Relative Retention Time
(–)-Epigallocatechin	0.56
(+)-Catechin	0.68
(–)-Epicatechin	0.98
(–)-Epigallocatechin-3-O-gallate	1.00
(–)-Gallocatechin-3-O-gallate	1.09
(–)-Epigallocatechin-3-O-(3'-O-methyl)-gallate	1.19
(–)-Epicatechin-3-O-gallate	1.27

Separately calculate the percentages of (–)-epigallocatechin, (+)-catechin, (–)-epicatechin, (–)-epigallocatechin-3-O-gallate, (–)-gallocatechin-3-O-gallate, (–)-epigallocatechin-3-O-(3'-O-methyl)-gallate, and (–)-epicatechin-3-O-gallate as (–)-epigallocatechin-3-O-gallate in the portion of the Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of each of the polyphenols in the *Sample solution*

r_S = peak area of (–)-epigallocatechin-3-O-gallate in *Standard solution A*

C_S = concentration of USP (–)- Epigallocatechin-3-O-gallate RS in *Standard solution A* (mg/mL)

C_U = concentration of Powdered Decaffeinated Green Tea Extract in the *Sample solution* (mg/mL)

Add the percentages calculated for the individual polyphenols.

Acceptance criteria: NLT 40.0% of (–)-epigallocatechin-3-O-gallate and NLT 60.0% of polyphenols, calculated as (–)-epigallocatechin-3-O-gallate on the anhydrous basis

CONTAMINANTS

• **HEAVY METALS, Method II** <231>: NMT 20 μg/g

• **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** <561>: Meets the requirements

• **MICROBIAL ENUMERATION TEST** <2021>: The total aerobic microbial count does not exceed 10⁴ cfu/g, and the total combined yeasts and molds count does not exceed 10³ cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

LIMIT OF GALLIC ACID

Solution A, Solution B, Mobile phase, and

Chromatographic system: Proceed as directed in the test for *Content of Polyphenols*.

Standard solution: 0.2 mg/mL of gallic acid in *Solution A*

Sample solution: 20 mg/mL of Powdered Extract in *Solution A*. Mix, and centrifuge.

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms, and measure the areas of the gallic acid peaks.

Separately calculate the percentages of gallic acid in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of gallic acid in the *Standard solution* (mg/mL)

C_U = concentration of Powdered Decaffeinated Green Tea Extract in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.0%

LIMIT OF CAFFEINE

Solution A: Methanol, tetrahydrofuran, phosphoric acid 85%, and water (50:10:3.5:936.5)

Solution B: Acetonitrile, methanol, and phosphoric acid 85% (946.5: 50: 3.5)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	100	0
35	0	100
40	0	100
45	100	0
55	100	0

Standard solution: 1 μg/mL of USP Caffeine RS in methanol

Sample solution: 1 mg/mL of Powdered Extract in methanol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Column: 4.6-mm × 25-cm; 5-μm packing L60¹

Column temperature: 25 ± 1°

Flow rate: 1 mL/min

Injection size: 15 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% determined from the caffeine peak

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms, and measure the areas of the caffeine peaks.

Separately calculate the percentages of caffeine in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Caffeine RS in the *Standard solution* (mg/mL)

C_U = concentration of Powdered Decaffeinated Green Tea Extract in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1%

- **WATER DETERMINATION, Method Ia <921>:** NMT 6.0%, determined on a 0.5 g
- **RESIDUE ON IGNITION <281>:** NMT 0.5%, determined on 1.0 g
- **OTHER REQUIREMENTS:** It meets the requirements of the test for *Residual Solvents* in *Botanical Extracts* <565>, *General Pharmacopeial Requirements*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. It meets other labeling requirements in *Botanical Extracts* <565>.

Guggul

DEFINITION

Guggul is the oleo-gum-resin obtained by incision or produced by spontaneous exudation from the stem and branches of *Commiphora wightii* (Arnott) Bhandari, also known as *Commiphora mukul* (Hook. ex. Stocks) Engl. or *Balsamodendrum mukul* (Hook.) (Fam. Burseraceae). It contains NLT 1.0% of guggulsterones E and Z, calculated on the dried basis as guggulsterone Z.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 10 mg/mL of USP Purified Guggul Extract RS with heating, in acetonitrile

Sample solution: Transfer about 0.5 g of crushed Guggul to a centrifuge tube. Add 25 mL of acetonitrile, and shake for 1 min. Heat in a water bath for 10–15 min

while shaking, cool, centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm in length

Application volume: 10 μL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable plate. Use a saturated chamber. Develop until the solvent front has moved about three-fourths the length of the plate, dry the plate, and examine under UV light at 254 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits bands at R_f values of about 0.38 and 0.47, due to guggulsterone E and Z, respectively. Both bands correspond in R_f values to bands from the *Standard solution*.

• **B. HPLC IDENTIFICATION TEST**

Analysis: Proceed as directed in the test for *Content of Guggulsterones E and Z*

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for guggulsterone E and Z at retention times that correspond to those of *Standard solution A*.

COMPOSITION

• **CONTENT OF GUGGULSTERONES E AND Z**

Mobile phase: A mixture of acetonitrile and water (45:55)

Standard solution A: 10 mg/mL of USP Purified Guggul Extract RS with heating, in acetonitrile. Pass the solution through a filter of 0.45-μm pore size before injection.

Standard solution B: 0.1 mg/mL of USP Guggulsterone Z RS in acetonitrile. Pass the solution through a filter of 0.45-μm pore size before injection.

Sample solution: Transfer about 2.0 g of crushed Guggul to a conical flask, and extract four times each with a 50-mL portion of acetonitrile. Shake for 1 min, and reflux in a water bath for 30 min, stirring with a magnetic stirrer. Evaporate the combined extracts to about 50 mL, and transfer to a 100-mL volumetric flask. Dilute with acetonitrile to volume, and pass through a filter of 0.45-μm pore size before injection.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 2.0 mL/min

Injection size: 20 μL

Column temperature: 27 ± 1°

System suitability

Samples: *Standard solution A* and *Standard solution B* [NOTE—The relative retention times for guggulsterones E and Z are about 0.69 and 1.0, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the reference chromatogram provided with the lot of USP Purified Guggul Extract RS being used.

Resolution: NLT 2.0 between the guggulsterone Z peak and the peak before, *Standard solution A*

Tailing factor: NMT 1.5 for the guggulsterone Z peak, *Standard solution B*

Relative standard deviation: NMT 2.0% for replicate injections for the guggulsterone Z peak, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

¹ Endcapped packing L1 columns can also be used in this test.

Allow *Standard solution A* to elute for NLT two times the retention time of guggulsterone *Z*, as determined in *Standard solution B*. Using the chromatogram of *Standard solution A* and the reference chromatogram provided with the lot of USP Purified Guggul Extract RS being used, identify the retention times of the peaks corresponding to guggulsterone *E* and guggulsterone *Z*. Calculate the percentage of guggulsterones *E* and *Z* as guggulsterone *Z* in the portion of Guggul taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

- r_U = sum of the peak responses of guggulsterones *E* and *Z* from the *Sample solution*
 r_S = peak response of guggulsterone *Z* from *Standard solution B*
 C_S = concentration of USP Guggulsterone *Z* RS in *Standard solution B* (mg/mL)
 V = final volume of the *Sample solution*, 100 mL
 W = weight of Guggul taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 1.0% on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 20 µg/g
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Guggul occurs in rounded or irregular conglomerates of tears, of variable sizes, light to dark brown, slightly sticky to touch, with characteristic and aromatic odor, and an aromatic, astringent taste.

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 1%
- **ARTICLES OF BOTANICAL ORIGIN**, *Alcohol-Soluble Extractives*, *Method 2* (561): NLT 33%
- **ETHYL ACETATE SOLUBLE EXTRACTIVES**

Sample: About 5.0 g of coarsely powdered Guggul

Analysis: Transfer the *Sample* to a glass-stoppered, conical flask. Add 25 mL of solvent hexane, insert a stopper into the flask, shake for 1 h, filter, and discard the filtrate. Repeat twice, and dry the residue in a vacuum over phosphorus pentoxide at room temperature for 8 h. Crush the dried material, and extract with four quantities, each of 25 mL, of ethyl acetate, by shaking each time for 1 h at room temperature, followed by filtration through a sintered glass funnel (porosity No. 3). Evaporate the combined filtrates under reduced pressure in a tared flask, dry the residue in a vacuum over phosphorus pentoxide at room temperature for 12 h, and weigh. Determine the percentage of the ethyl acetate soluble extractives calculated from the weight of Guggul taken.

Acceptance criteria: 22%–30%

- **LOSS ON DRYING** (731): Dry 1.0 g at 105° for 2 h: it loses NMT 8.0% of its weight.
- **RESIDUE ON IGNITION** (281): NMT 10.0%, ignited at 800 ± 25°
- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* (561): NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store in a cool place.
- **LABELING:** The label states the Latin binomial of the species of *Commiphora* from which the oleo-gum-resin was obtained and, following the official name, the part of the plant contained in the article.

- **USP REFERENCE STANDARDS** (11)
 USP Guggulsterone *Z* RS
 USP Purified Guggul Extract RS

Native Guggul Extract

DEFINITION

Native Guggul Extract is prepared from Guggul, using ethyl acetate, alcohol, or methanol. The ratio of starting crude plant material to Native Extract is approximately 9:1. It contains NLT 5.0% of guggulsterones *E* and *Z*, calculated on the anhydrous basis as guggulsterone *Z*. It does not contain added substances.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 10 mg/mL of USP Purified Guggul Extract RS, with heating, in acetonitrile

Sample solution: Homogenize Native Guggul Extract by heating in a water bath at 60°–80°. Prepare a 5-mg/mL solution in acetonitrile with heating.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm in length

Application volume: 10 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable plate. Use a saturated chamber. Develop until the solvent front has moved about three-fourths the length of the plate, dry the plate, and examine under UV light at 254 nm.

Purified Guggul Extract

DEFINITION

Purified Guggul Extract is prepared from Native Guggul Extract by fractionation using aqueous methanol. It contains NLT 90.0% and NMT 110.0% of the labeled amount of guggulsterones *E* and *Z*, calculated as guggulsterones *Z*. It may be a semisolid extract with no added substances or powder extract containing suitable added substances.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 10 mg/mL of USP Purified Guggul Extract RS, with heating, in acetonitrile.

Sample solution: 10 mg/mL in acetonitrile from Purified Guggul Extract, dissolved with heating, cooled, and centrifuged.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm in length

Application volume: 10 μL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable plate. Use a saturated chamber. Develop until the solvent front has moved about three-fourths the length of the plate, dry the plate, and examine under UV light at 254 nm.

Guggul Tablets**DEFINITION**

Guggul Tablets are prepared from Native Guggul Extract or Purified Guggul Extract. Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of Extract, calculated as the sum of guggulsterones *E* and *Z*.

IDENTIFICATION• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 10 mg/mL of USP Purified Guggul Extract RS, with heating, in acetonitrile

Sample solution: Powder and transfer a portion of the Tablets equivalent to 100 mg of Extract to a conical flask. Extract three times, each with 25 mL of acetonitrile, in a 55° water bath for 15 min, stirring with a magnetic stirrer, and filter. Evaporate the combined extracts to dryness in a vacuum between 45° and 50°, dissolve the residue in 10 mL of acetonitrile, centrifuge, and use the clear supernatant.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm in length

Application volume: 10 μL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable plate. Use a saturated chamber. Develop until the solvent front has moved about three-fourths the length of the plate, dry the plate, and examine under UV light at 254 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits bands at R_f values of about 0.38 and 0.47, due to guggulsterone *E* and *Z*, respectively. Both bands correspond in R_f to bands in the chromatogram from the *Standard solution*.

Hawthorn Leaf with Flower

DEFINITIONHawthorn Leaf with Flower consists of the dried tips of the flower-bearing branches up to 7 cm in length of *Crataegus monogyna* Jacq. emend Lindman. or *Crataegus laevigata* (Poir.) DC., also known as *Crataegus oxyantha* Linné (Fam. Rosaceae). It contains NLT 0.6% of C-glycosylated flavones, expressed as vitexin (C₂₁H₂₀O₁₀), and NLT 0.45% of O-glycosylated flavones, expressed as hyperoside (C₂₁H₂₀O₁₂), calculated on the dried basis.**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Standard solution: 0.1 mg/mL each of chlorogenic acid, rutin, USP Hyperoside RS, and USP Vitexin RS in methanol. [NOTE—Reserve a portion of this solution for use in *Identification test B*.]**Sample solution:** 0.1 g/mL, prepared as follows. Finely powder 10 g of Hawthorn Leaf with Flower. Transfer 1 g of the powder to a flask, and add 10 mL of methanol. Heat the flask on a water bath maintained at 65° for 5 min, cool, filter, and use the filtrate.**Adsorbent:** 0.50-mm layer of chromatographic silica gel mixture**Developing solvent system:** Ethyl acetate, glacial acetic acid, formic acid, and water (10:1.1:1.1:2.6)**Spray reagent A:** 2-aminoethyl diphenylborinate in methanol (1 in 100)**Spray reagent B:** Polyethylene glycol 4000 in methanol (5 in 100)**Analysis****Samples:** *Standard solution* and *Sample solution*Proceed as directed in the chapter, except to dry the plate at 105°, and spray the plate while still hot with 10 mL of *Spray reagent A* and then with 10 mL of *Spray reagent B*. Allow the plate to air-dry for 30 min, and examine the plate under long-wavelength UV light.**Acceptance criteria:** The chromatogram of the *Standard solution* exhibits an intense orange zone (at R_f value of 0.3) due to rutin; a light blue fluorescent zone (at R_f value of 0.4) due to chlorogenic acid; a yellowish-orange zone (at R_f value of 0.55) due to hyperoside; and a yellowish-green zone (at R_f value of 0.65) due to vitexin. The chromatogram of the *Sample solution*, in addition to the zones due to rutin, chlorogenic acid, hyperoside, and vitexin, exhibits a yellowish-green zone (at R_f value of 0.35) due to vitexin-2-rhamnoside; a light blue fluorescent zone (at R_f value of 0.6) due to spiraeoside; and a light blue fluorescent zone near the solvent front (at R_f value of 0.9) due to caffeic acid. The

chromatogram of the *Sample solution* also exhibits other zones with weaker fluorescence.

• **B. PROCEDURE**

Solution A: Tetrahydrofuran, acetonitrile, and methanol (92.4:3.4:4.2)

Solution B: 0.5% phosphoric acid in water

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	12	88
12	12	88
25	18	82
30	18	82

Standard solution: Use the *Standard solution* reserved from *Identification* test A.

Sample solution: Transfer 3 g of finely powdered Hawthorn Leaf with Flower to a 100-mL round-bottom flask, add 60 mL of a mixture of methanol and water (4:1), and heat on a hot water bath under reflux for 1 h. Cool, filter, and collect the filtrate in a separate flask. Transfer the residue from the filter back to the flask, add 40 mL of a mixture of methanol and water (4:1), and heat on a hot water bath under reflux for 10 min. Cool, filter, and combine the filtrate with the filtrate obtained from the first extraction. Evaporate the solvent from the combined filtrates under vacuum to a volume of 20 mL. Dilute the resulting solution with a mixture of methanol and water (4:1) to 25.0 mL. Filter 5.0 mL of this solution through a freshly conditioned solid-phase extraction column containing 360 mg of packing L1, collect the filtrate in a 10-mL volumetric flask, and dilute with a mixture of methanol and water (4:1) to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 336 nm

Column: 4.0-mm × 10-cm; 5-μm packing L1

Temperature: 25°

Flow rate: 1 mL/min

Injection size: 5 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for chlorogenic acid, vitexin, rutin, and hyperoside are 0.26, 1.0, 1.16, and 1.4, respectively.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The relative retention times for acetyl vitexin-2''-O-rhamnoside, vitexin, isovitexin, and vitexin-2''-O-rhamnoside are 1.53, 1.0, 0.73, and 0.67, respectively.]

Measure the retention times for the major peaks.

Acceptance criteria: The retention times of the peaks for chlorogenic acid, vitexin, rutin, and hyperoside of the *Sample solution* correspond to those of the *Standard solution*.

COMPOSITION

• **CONTENT OF C-GLYCOSYLATED FLAVONES**

Solution A: 0.5% solution of phosphoric acid in water
Solution B: Tetrahydrofuran, isopropyl alcohol, and acetonitrile (10:8:3)

Mobile phase: *Solution A* and *Solution B* (22:3)

Standard solution: 0.3 mg/mL of USP Vitexin RS in *Solution B*, with heating if necessary

Sample solution: Finely powder 100 g of Hawthorn Leaf with Flower. Transfer about 4 g of the powder, accurately weighed, to a continuous-extraction apparatus fitted with a flask containing 80 mL of methanol, and

extract the test specimen for 5 h. Cool, remove the flask, and evaporate the solvent from the extract under vacuum to 40 mL. Transfer this solution to a 50-mL volumetric flask, and dilute with methanol to volume. Transfer 10.0 mL of the solution to a suitable flask fitted with a reflux condenser, add 4 mL of 25% hydrochloric acid, and heat the flask under reflux on a water bath at 65° for 90 min. Cool, transfer the contents of the flask to a 50-mL volumetric flask, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Column: 4-mm × 10-cm; packing L1

Flow rate: 1 mL/min

Injection size: 5 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: 0.8–2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of C-glycosylated flavones, expressed as vitexin (C₂₁H₂₀O₁₀), in the portion of Hawthorn Leaf with Flower taken:

$$\text{Result} = (C_s/C_u) \times (\Sigma r_u/r_s) \times 100$$

C_s = concentration of USP Vitexin RS in the *Standard solution* (mg/mL)

C_u = concentration of Hawthorn Leaf with Flower in the *Sample solution* (mg/mL)

Σr_u = sum of the peak areas of vitexin and isovitexin, with a relative retention time of about 1.0 and 0.85, respectively, in the chromatogram of the *Sample solution*

r_s = vitexin peak area of the *Standard solution*

Acceptance criteria: NLT 0.6% of C-glycosylated flavones, expressed as vitexin (C₂₁H₂₀O₁₀) on the dried basis

• **CONTENT OF O-GLYCOSYLATED FLAVONES**

Mobile phase: Methanol, phosphoric acid, and water (100:1:100)

Standard solution: 0.05 mg/mL of USP Quercetin RS in methanol

Sample solution: Proceed as directed for the *Sample solution* under *Content of C-Glycosylated Flavones*, except to use 1 mL of 25% hydrochloric acid for 60 min instead of 4 mL of 25% hydrochloric acid for 90 min.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 370 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: 0.8–2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of O-glycosylated flavones, expressed as hyperoside (C₂₁H₂₀O₁₂), in the portion of Hawthorn Leaf with Flower taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = quercetin peak area from the *Sample solution*
 r_S = quercetin peak area from the *Standard solution*
 C_S = concentration of USP Quercetin RS in the *Standard solution* (mg/mL)
 C_U = concentration of Hawthorn Leaf with Flower in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of hyperoside, 464.38
 M_{r2} = molecular weight of quercetin, 302.24

Acceptance criteria: NLT 0.45% of O-glycosylated flavones, expressed as hyperoside ($C_{21}H_{20}O_{12}$) on the dried basis

- **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: It shows fragments of dark brown, lignified branches, usually from 1 mm to NMT 2.5 mm in diameter, bearing alternate petiolate leaves, with small, often deciduous styles, and bearing numerous white flowers in a corymbose arrangement. The leaves are more or less strongly lobate, and their margins are slightly or very slightly serrate. *C. laevigata* has pinnatilobate to pinnatifid leaves, divided into three, five, or seven obtuse lobes; the leaves of *C. monogyna* are almost pinnatisect with three to five acute lobes. The adaxial surface of the leaf is dark green to brownish-green; the abaxial surface is lighter, greyish-green, and shows a dense network of clearly visible veinlets and slightly prominent principal veins. The leaves of *C. laevigata* and *C. monogyna* are glabrous or bear isolated trichomes. The flowers consist of a brownish-green tubulous calyx, ending in its upper part in five triangular segments, and of five yellowish-white to brownish free petals, rounded to widely oval, shortly unguiculate, and with numerous stamens. The ovary, fused to the tubulous calyx, bears one to three long styles and consists of the same number of carpels, each containing one fertile ovule. *C. monogyna* has one style and one carpel, and *C. laevigata* has two or three styles and carpels.

Microscopic: When reduced to a fine powder and examined under a microscope, the yellowish-green powder shows the following characteristics: unicellular covering trichomes, usually with thick walls and wide lumens, almost straight to somewhat curved, pitted at the base; fragments of leaf epidermis with cells that have sinuous to polygonal walls and large anomocytic stomata surrounded by four to seven subsidiary cells; clusters of parenchymatous cells containing calcium oxalate crystals, usually from 10–20 μ m in length; fragments of petals showing rounded polygonal epidermal cells, strongly papillose, with thick walls, the cuticle of which clearly shows wavy striations; fragments of anthers whose endothecium has an arched and regularly thickened margin; fragments of stems containing collenchymatous cells, vessels and fibers of lignified sclerenchyma, with narrow lumens; numerous rounded to elliptical triangular pollen grains up to 45 μ m in diameter, with free exines and three germinal pores.

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS (2021):** The total bacterial count does not exceed 10^4 cfu/g, the total combined molds and yeasts count does not exceed 100 cfu/g, and it meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

- **LOSS ON DRYING (731):** Dry about 1.0 g of finely powdered Hawthorn Leaf with Flower at 105° for 2 h: it loses NMT 10.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 9.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in a well-closed container, protected from light.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

 USP Vitexin RS

Powdered Hawthorn Leaf with Flower

DEFINITION

Powdered Hawthorn Leaf with Flower is Hawthorn Leaf with Flower reduced to a fine or very fine powder.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Standard solution: 0.1 mg/mL each of chlorogenic acid, rutin, USP Hyperoside RS, and USP Vitexin RS in methanol. [NOTE—Reserve a portion of this solution for use in *Identification test B*.]

Sample solution: Transfer about 1 g of Powdered Hawthorn Leaf with Flower to a flask, and add 10 mL of methanol. Heat the flask on a water bath maintained at 65° for 5 min, cool, filter, and use the filtrate.

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Developing solvent system: Ethyl acetate, glacial acetic acid, formic acid, and water (10:1.1:1.1:2.6)

Spray reagent A: 2-Aminoethyl diphenylborinate in methanol (1 in 100)

Spray reagent B: Polyethylene glycol 4000 in methanol (5 in 100)

Analysis

Samples: *Standard solution* and *Sample solution*
 Proceed as directed in the chapter, except to dry the plate at 105°, and spray the plate while still hot with 10 mL of *Spray reagent A* and then with 10 mL of *Spray reagent B*. Allow the plate to air-dry for 30 min, and examine the plate under long-wavelength UV light.

Acceptance criteria: The chromatogram of the *Standard solution* exhibits an intense orange zone (at R_f value of 0.3) due to rutin; a light blue fluorescent zone (at R_f value of 0.4) due to chlorogenic acid; a yellowish-orange zone (at R_f value of 0.55) due to hyperoside; and a yellowish-green zone (at R_f value of 0.65) due to vitexin. The chromatogram of the *Sample solution*, in addition to the zones due to rutin, chlorogenic acid, hyperoside, and vitexin, exhibits a yellowish-green zone (at R_f value of 0.35) due to vitexin-2-rhamnoside; a light blue fluorescent zone (at R_f value of 0.6) due to spiraeoside; and a light blue fluorescent zone near the solvent front (at R_f value of 0.9) due to caffeic acid. The chromatogram of the *Sample solution* also exhibits other zones with weaker fluorescence.

- **B. PROCEDURE**

Solution A: Tetrahydrofuran, acetonitrile, and methanol (92.4:3.4:4.2)

Solution B: 0.5% phosphoric acid in water
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	12	88
12	12	88
25	18	82
30	18	82

Standard solution: Use the *Standard solution* reserved from *Identification* test A.

Sample solution: Transfer about 3 g of Powdered Hawthorn Leaf with Flower to a 100-mL round-bottom flask, add 60 mL of a mixture of methanol and water (4:1), and heat on a hot water bath under reflux for 1 h. Cool, filter, and collect the filtrate in a separate flask. Transfer the residue from the filter back to the flask, add 40 mL of a mixture of methanol and water (4:1), and heat on a hot water bath under reflux for 10 min. Cool, filter, and combine the filtrate with the filtrate obtained from the first extraction. Evaporate the solvent from the combined filtrates under vacuum to a volume of 20 mL. Dilute the resulting solution with a mixture of methanol and water (4:1) to 25.0 mL. Filter 5.0 mL of this solution through a freshly conditioned solid-phase extraction column containing 360 mg of packing L1, collect the filtrate in a 10-mL volumetric flask, and dilute with a mixture of methanol and water (4:1) to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 336 nm

Horse Chestnut

DEFINITION

Horse Chestnut consists of the dried seeds of *Aesculus hippocastanum* L. (Fam. Hippocastanaceae). It is harvested in the fall. It contains NLT 3.0% of triterpene glycosides, calculated on the dried basis as escin ($C_{55}H_{86}O_{24}$).

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 5 mg/mL of USP Escin RS in methanol

Sample solution: Transfer 1 g of the powdered plant material to a screw-capped centrifuge tube, add 10 mL of a mixture of alcohol and water (7:3), and heat on a steam bath for 10 min. Centrifuge, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 μ L

Developing solvent system: Use the upper phase of a mixture of 1-butanol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85:10:5:0.5)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms to a length of NLT 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, heat the plate at 100° for 5 min, and examine the plate under daylight.

Acceptance criteria: The chromatogram from the *Sample solution* shows a blue-violet zone corresponding to escin, comparable in position and color to the main zone in the chromatogram from the *Standard solution*. Above this zone, the chromatogram of the *Sample solution* shows several narrow, brown to brownish-red zones that are less intense than the zone corresponding to escin.

COMPOSITION

CONTENT OF TRITERPENE GLYCOSIDES

Solvent A: Methanol and water (13:7)

Solvent B: Use the lower phase of a mixture of chloroform, 0.1 N hydrochloric acid, and 1-propanol (5:3:2).

Reagent: Dissolve 75 mg of ferric chloride in 50 mL of glacial acetic acid. Add 50 mL of sulfuric acid, while shaking and cooling. Prepare immediately before use.

Standard solution A: 0.2 mg/mL of USP Escin RS in glacial acetic acid, shaking for 1 min

Standard solution B: 0.4 mg/mL of USP Escin RS in glacial acetic acid, shaking for 1 min

Standard solution C: 0.6 mg/mL of USP Escin RS in glacial acetic acid, shaking for 1 min

Sample solution: Weigh 1 g of ground seeds, and place in a 250-mL round-bottom flask. Add exactly 100 mL of *Solvent A*, and weigh the filled flask with a precision of ± 0.1 g. Attach a condenser to the flask, reflux for 30 min, and allow to cool. Adjust to the initial weight by adding *Solvent A* as needed, and filter. Transfer 30.0 mL of the filtrate to a round-bottom flask, and evaporate the solvents under vacuum. Dissolve the residue with 20 mL of 0.1 N hydrochloric acid, and quantitatively transfer with the aid of two additional 5-mL portions of 0.1 N hydrochloric acid to a 250-mL separation funnel. Add 20 mL of 1-propanol and 50 mL of chloroform, and shake vigorously for 2 min. Separate the chloroform layer, and add *Solvent B* to the upper phase remaining in the separation funnel. Shake vigorously for 2 min, and separate the chloroform layer. Combine the chloroform layers in a round-bottom flask, and evaporate to dryness under vacuum. Evaporate the remaining solvents with the aid of a current of air. Wash the residue with two 10-mL portions of ether, filter, wash the filter with 10 mL of ether, and discard the ether filtrates. After evaporation of the residual ether, add to the residue a 10-mL portion of glacial acetic acid, and pass through the previously used dried filter into a 50-mL volumetric flask. Repeat the addition of glacial acetic acid followed by filtration two additional times, combining the filtrates in the volumetric

flask. Wash the round-bottom flask with small quantities of glacial acetic acid, and filter into the volumetric flask. Dilute with glacial acetic acid to volume.

Instrumental conditions

Mode: Visual

(See *Spectrophotometry and Light-Scattering* (851).)

Wavelength: 540 nm

Blank: Glacial acetic acid

Analysis: Transfer 1 mL each of *Standard solutions A, B, and C, Sample solution*, and *Blank* to separate test tubes with stoppers. Add 4.0 mL of *Reagent* to each tube, cap the tubes, and place them in a water bath at 60° for 25 min, shaking occasionally. Measure the absorbances of the reacted *Sample solution* and the reacted *Standard solutions A, B and C*, and correct for the *Blank*. Plot the absorbances of the reacted *Standard solutions A, B, and C* versus concentrations, in mg/mL of USP Escin RS in the corresponding *Standard solution*. From the graphs determine the concentration, *C*, in mg/mL, of triterpene glycosides as escin ($C_{55}H_{86}O_{24}$) in the *Sample solution*. Calculate the percentage of triterpene glycosides as escin in the portion of Horse Chestnut taken:

$$\text{Result} = (C/W) \times (50/3)$$

C = concentration of triterpene glycosides in the *Sample solution* as obtained above (mg/mL)

W = weight of Horse Chestnut taken to prepare the *Sample solution* (g)

Acceptance criteria: NLT 3.0% of triterpene glycosides, calculated as escin ($C_{55}H_{86}O_{24}$), on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 20 µg/g
- **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residues* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^6 cfu/g, the total combined molds and yeast count does not exceed 10^4 cfu/g, and the enterobacterial count is NMT 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: Horse chestnut seeds are dense and hard, subspherical to oval, slightly flattened, and from 2 to 4 cm in diameter. They have a dark brown seed coat from 1 to 1.5 mm thick, with a large, round, light brown spot (hilum). The seed coat is shiny, but only in fresh condition. The space under the coat is totally filled with the shiny, massive embryo and its large, pale yellow cotyledons lacking endosperm.

Microscopic: The epidermis of the testa in surface view has yellowish-brown cells of fairly uniform size, with the majority of cells rounded to polygonal, and a few that are square to obscurely triangular. The walls of these cells are considerably but rather unevenly thickened, and lack pits. In the sectional view, the cells are columnar, approximately 3–4 times as high as they are wide, with the outer periclinal wall markedly thickened, uneven, and becoming thinner toward the base; beneath the epidermis there are a few layers of small collenchymatously thickened cells with small intercellular spaces; the greater part of the testa consists of larger, loosely packed parenchymatous cells forming a spongy tissue; the walls are variably and unevenly thickened, with intercellular and large circular spaces well marked; the inner layer of the testa is a narrow zone, with ill-defined and thinner-walled cells. All the parenchymatous cells of the testa are darkly pigmented. The embryo has an outer layer of small colorless cells, almost square in sectional view, with outer and side walls thickened. In the surface view, only the irregular

and more or less polygonal lumens are discernible, giving a reticulate, pitted appearance. Cotyledons are moderately thickened and indistinctly pitted, having round to ovoid parenchymatous cells densely filled with starch. Starch granules, mainly simple, are present in two size ranges: from 15 to 30 µm and from 3 to 10 µm. The largest granules vary from circular, ovoid, and bluntly polygonal to pyriform, most of them with a well-marked cleft or stellate hilum, and lacking striations. The smaller starch granules are less variable, spherical to ovoid, with the hilum more often a point. Compound starch granules are found very infrequently.

EXTRACTABLE MATTER

Analysis: Proceed as directed for *Articles of Botanical Origin* (561), *Alcohol-Soluble Extractives, Method 2*, except use a mixture of methanol and water (8:2) instead of alcohol.

Acceptance criteria: NLT 18.0%

ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter

(561): NMT 2.0%

• **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 10.0% of its weight.

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 4.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a well-closed, light-resistant container, protected from moisture.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

USP Escin RS

Powdered Horse Chestnut

DEFINITION

Powdered Horse Chestnut is Horse Chestnut reduced to a powder or very fine powder. It contains NLT 3.0% of triterpene glycosides, calculated on the dried basis as escin ($C_{55}H_{86}O_{24}$).

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 5 mg/mL of USP Escin RS in methanol

Sample solution: Transfer 1 g of the Powdered Horse Chestnut to a screw-capped centrifuge tube, add 10 mL of a mixture of alcohol and water (7:3), and heat on a steam bath for 10 min. Centrifuge, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 µL

Developing solvent system: Use the upper phase of a mixture of 1-butanol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85: 10: 5: 0.5)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms to a length of NLT 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, heat the plate at 100° for 5 min, and examine the plate under daylight.

Acceptance criteria: The chromatogram from the *Sample solution* shows a blue-violet zone corresponding to escin, comparable in position and color to the main zone in the chromatogram from the *Standard solution*. Above this zone, the chromatogram of the *Sample solu-*

tion shows several narrow, brown to brownish-red zones that are less intense than the zone corresponding to escin.

COMPOSITION

• CONTENT OF TRITERPENE GLYCOSIDES

Solvent A: Methanol and water (13:7)

Solvent B: Use the lower phase of a mixture of chloroform, 0.1 N hydrochloric acid, and 1-propanol (5:3:2).

Reagent: Dissolve 75 mg of ferric chloride in 50 mL of glacial acetic acid. Add 50 mL of sulfuric acid, while shaking and cooling. Prepare immediately before use.

Standard solution A: 0.2 mg/mL of USP Escin RS in glacial acetic acid, shaking for 1 min

Standard solution B: 0.4 mg/mL of USP Escin RS in glacial acetic acid, shaking for 1 min

Standard solution C: 0.6 mg/mL of USP Escin RS in glacial acetic acid, shaking for 1 min

Sample solution: Weigh 1 g of Powdered Horse Chestnut, and place in a 250-mL round-bottom flask. Add exactly 100 mL of *Solvent A*, and weigh the filled flask with a precision of ± 0.1 g. Attach a condenser to the flask, reflux for 30 min, and allow to cool. Adjust to the initial weight by adding *Solvent A* as needed, and filter. Transfer 30.0 mL of the filtrate to a round-bottom flask, and evaporate the solvents under vacuum. Dissolve the residue with 20 mL of 0.1 N hydrochloric acid, and quantitatively transfer with the aid of two additional 5-mL portions of 0.1 N hydrochloric acid to a 250-mL separation funnel. Add 20 mL of 1-propanol and 50 mL of chloroform, and shake vigorously for 2 min. Separate the chloroform layer, and add *Solvent B* to the upper phase remaining in the separation funnel. Shake vigorously for 2 min, and separate the chloroform layer. Combine the chloroform layers in a round-bottom flask, and evaporate to dryness under vacuum. Evaporate the remaining solvents with the aid of a current of air. Wash the residue with two 10-mL portions of ether, filter, wash the filter with 10 mL of ether, and discard the ether filtrates. After evaporation of the residual ether, add to the residue a 10-mL portion of glacial acetic acid, and pass through the previously used dried filter into a 50-mL volumetric flask. Repeat the addition of glacial acetic acid followed by filtration two additional times, combining the filtrates in the volumetric flask. Wash the round-bottom flask with small quantities of glacial acetic acid, and filter into the volumetric flask. Dilute with glacial acetic acid to volume.

Instrumental conditions

Wavelength: 540 nm

Mode: Visible

Blank: Glacial acetic acid

Analysis: Transfer 1 mL each of *Standard solutions A, B, and C*, the *Sample solution*, and the *Blank* to separate test tubes with stoppers. Add 4.0 mL of *Reagent* to each tube, cap the tubes, and place them in a water bath at 60° for 25 min, shaking occasionally. Measure the absorbances of the reacted *Sample solution* and the reacted *Standard solutions A, B, and C*, and correct for the *Blank*. Plot the absorbances obtained from the reacted *Standard solutions A, B, and C*, versus concentrations, in mg/mL of USP Escin RS in the corresponding *Standard solution*. From the graphs so obtained, determine the concentration, *C*, in mg/mL, of triterpene glycosides as escin ($C_{55}H_{86}O_{24}$) in the *Sample solution*.

Calculate the percentage of triterpene glycosides as escin in the portion of Powdered Horse Chestnut taken:

$$\text{Result} = (C/W) \times (50/3)$$

- C* = concentration of triterpene glycosides in the *Sample solution* as obtained above (mg/mL)
W = weight of Powdered Horse Chestnut taken to prepare the *Sample solution* (g)

Acceptance criteria: NLT 3.0% of triterpene glycosides, calculated as escin ($C_{55}H_{86}O_{24}$), on the dried basis

CONTAMINANTS

• **HEAVY METALS**, *Method III* (231): NMT 20 ppm

• **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residues* (561): Meets the requirements

• **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^6 cfu/g, the total combined molds and yeast count does not exceed 10^4 cfu/g, and the enterobacterial count is NMT 10^3 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

• **BOTANIC CHARACTERISTICS:** Yellowish-brown powder, odorless, with a somewhat mealy, disagreeably bitter, and lingering taste. It shows numerous, different-sized fatty oil droplets that are free or within the thin-walled, colorless tissue of the cotyledons. Fragments of the testa consist of thick-walled pitted sclerenchymatous cells. The following are also present: pyriform, roundish or reniform larger individual starch granules from 15 to 30 μ m in diameter, smaller individual granules from 3 to 10 μ m, and only a few compounded granules consisting of 2–4 single grains that form rows up to 45 μ m in length. Many of the starch granules have a bistellate or polystellate, but rarely simple, hilum.

• EXTRACTABLE MATTER

Analysis: Proceed as directed for *Articles of Botanical Origin* (561), *Alcohol-Soluble Extractives*, *Method 2*, except use a mixture of methanol and water (8:2) instead of alcohol.

Acceptance criteria: NLT 18.0%

• **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 10.0% of its weight.

• **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 4.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, protected from moisture.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.

• **USP REFERENCE STANDARDS** (11)
USP Escin RS

Powdered Horse Chestnut Extract

DEFINITION

Powdered Horse Chestnut Extract is prepared from Horse Chestnut by extraction with alcohol–water mixtures or methanol–water mixtures. The ratio of starting plant material to extract is between 5:1 and 8:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of triterpene glycosides, calculated on the dried basis as escin ($C_{55}H_{86}O_{24}$). It may contain suitable added substances.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 5 mg/mL of USP Escin RS in methanol

Sample solution: To 10 mL of methanol add a quantity of Powdered Extract equivalent to 25 mg of the labeled amount of triterpene glycosides, and shake. Allow to stand for 15 min before use.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 μ L

Developing solvent system: Use the upper phase of a mixture of 1-butanol, glacial acetic acid, and water (5:1:4).

Spray reagent: Methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85: 10: 5: 0.5)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms to a length of NLT 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, heat the plate at 100° for 5 min, and examine the plate under daylight.

Acceptance criteria: The chromatogram from the *Sample solution* shows a blue-violet zone corresponding to escin, comparable in position and color to the main zone in the chromatogram from the *Standard solution*. Above this zone, the chromatogram of the *Sample solution* shows several narrow, brown to brownish-red zones that are less intense than the zone corresponding to escin.

Licorice

DEFINITION

Licorice consists of the roots, rhizomes, and stolons of *Glycyrrhiza glabra* L. or *Glycyrrhiza uralensis* Fish. ex DC. (Fam. Fabaceae). It contains NLT 2.5% of glycyrrhizic acid ($C_{42}H_{62}O_{16}$), calculated on the dried basis.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 5 mg/mL of USP Glycyrrhizic Acid RS in a mixture of alcohol and water (7:3)

Sample solution: 2 g of pulverized Licorice in 10 mL of a mixture of alcohol and water (7:3). Heat by shaking on a water bath for 5 min, cool, and filter.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 2 μ L

Developing solvent system: Butyl alcohol, glacial acetic acid, and water (7:1:2)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram in an unsaturated chamber to a length of 10 cm. Examine the plate under 254-nm light.

Acceptance criteria: The chromatograms show a dark purple zone, among other spots, due to glycyrrhizic acid at an R_f value of 0.4.

COMPOSITION

• **CONTENT OF GLYCYRRHIZIC ACID**

Diluent: Alcohol and water (1:1)

Solution A: Diluted acetic acid (1 in 15)

Mobile phase: Acetonitrile and *Solution A* (2:3)

Standard solution: 0.25 mg/mL of USP Glycyrrhizic Acid RS in *Diluent*

Sample solution: Transfer 500 mg of Licorice, reduced to a powder, to a suitable flask. Add 70 mL of *Diluent*, shake for 15 min, centrifuge, and decant the supernatant into a 100-mL volumetric flask. Mix the residue with 25 mL of *Diluent*, shake for 15 min, centrifuge, and add the supernatant to the volumetric flask. Dilute with *Diluent* to volume, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; packing L1

Flow rate: 0.6 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 5000 theoretical plates determined from glycyrrhizic acid

Tailing factor: NMT 2.0 for the glycyrrhizic acid peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) in the portion of Licorice taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area of glycyrrhizic acid from the *Sample solution*

r_S = peak area of glycyrrhizic acid from the *Standard solution*

C_S = concentration of USP Glycyrrhizic Acid RS in the *Standard solution* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Licorice taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 2.5% on the dried basis

CONTAMINANTS

• **HEAVY METALS**, *Method III* <231>: NMT 30 μ g/g

• **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residues* <561>: Meets the requirements

SPECIFIC TESTS

• **BOTANIC CHARACTERISTICS**

Macroscopic: The terrestrial stem is nearly cylindrical, 0.5–3.0 cm in diameter, and over 1 m in length; it is externally dark brown to red-brown and longitudinally wrinkled. It often has lenticels, small buds, and scaly leaves. The transverse section reveals a rather clear border between the phloem and the xylem, and a radial structure that often has radiating splits.

Microscopic: The transverse section reveals several yellow-brown cork layers, and a layer of phelloderm that is 1–3 cells thick. The cortex exhibits medullary rays, and obliterated sieve portions radiate alternately. The phloem exhibits groups of phloem fibers, which are surrounded by crystal cells, with thick but incompletely lignified walls. The vessels are accompanied by xylem fibers, which are surrounded by crystal cells, and by xylem parenchyma cells. The parenchyma cells contain starch grains, and often contain single crystals of calcium oxalate.

Licorice Fluidextract—see Licorice Fluidextract NF**Ground Limestone****DEFINITION**Ground Limestone is a fine, white to off-white, microcrystalline powder mainly consisting of calcium carbonate. It is obtained by crushing, grinding, and classifying naturally occurring limestone, benefited by flotation and/or air classification. After drying at 200° for 4 h, it contains NLT 94.0% and NMT 100.5% of calcium carbonate (CaCO₃).**IDENTIFICATION****• A. IDENTIFICATION TESTS—GENERAL, Calcium <191>****Analysis:** Add acetic acid to the Ground Limestone, and boil the resulting solution.**Acceptance criteria:** The solution produces effervescence (presence of carbonate) after the addition of acetic acid. After boiling, it meets the requirements in the chapter.**• B. ACID-INSOLUBLE SUBSTANCES:** It meets the requirements in the test for *Acid-Insoluble Substances*.**ASSAY****• PROCEDURE****Sample:** 200 mg of Ground Limestone, previously dried at 200° for 4 h**Blank:** Proceed as directed in the *Analysis*, except omit the test specimen.**Titrimetric system**(See *Titrimetry* <541>.)**Mode:** Direct titration**Titrant:** 0.05 M edetate disodium VS**Endpoint detection:** Visual**Analysis:** Transfer the *Sample* to a 250-mL beaker. Moisten thoroughly with a few mL of water, and add, dropwise, sufficient 3 N hydrochloric acid to dissolve. Add 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue, and titrate with the *Titrant* until the solution is a distinct blue color. Perform a *Blank* determination.Calculate the percentage of calcium carbonate (CaCO₃) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times M \times F/W\} \times 100$$

 V_S = *Titrant* volume consumed by the *Sample* (mL) V_B = *Titrant* volume consumed by the *Blank* (mL) M = actual molarity of the *Titrant* (mM/mL) F = equivalency factor, 100.1 mg/mM W = *Sample* weight (mg)**Acceptance criteria:** 94.0%–100.5%**IMPURITIES****• ARSENIC, Method I <211>****Test preparation:** Slowly dissolve 1.0 g in 15 mL of hydrochloric acid, and dilute with water to 55 mL.**Analysis:** Proceed as directed in the chapter, except omit the addition of 20 mL of 7 N sulfuric acid.**Acceptance criteria:** It meets the requirements in the chapter (NMT 3 ppm).**• LEAD <251>****Test preparation:** Mix 1.0 g with 5 mL of water, slowly add 8 mL of 3 N hydrochloric acid, evaporate on a steam bath to dryness, and dissolve the residue in 5 mL of water.

- Acceptance criteria:** NMT 3 ppm
- **HEAVY METALS** (231)
Test preparation: Mix 1.0 g with 5 mL of water, slowly add 8 mL of 3 N hydrochloric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 20 mL of water, filter, and add water to the filtrate to make 25 mL.
Acceptance criteria: NMT 20 ppm
 - **LIMIT OF MAGNESIUM AND ALKALI SALTS**
Sample: 1.0 g
Analysis: Mix the *Sample* with 40 mL of water. Carefully add 5 mL of hydrochloric acid, heat the solution, and boil for 1 min. Rapidly add 40 mL of oxalic acid TS, and stir vigorously until precipitation is well established. Add immediately to the warm mixture 2 drops of methyl red TS and then 6 N ammonium hydroxide, dropwise, until the mixture is just alkaline. Cool to room temperature. Transfer to a 100-mL graduated cylinder, dilute with water to 100 mL, mix, and allow to stand for 4 h or overnight. Filter, and to 50 mL of the clear filtrate in a platinum dish add 0.5 mL of sulfuric acid, and evaporate the mixture on a steam bath to a small volume. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Ignite the residue to constant weight.
Acceptance criteria: NMT 3.5%. The weight of the residue is NMT 17.5 mg.
 - **LIMIT OF FLUORIDE**
[NOTE—Prepare and store all solutions in plastic containers.]
Buffer solution: 294 mg/mL of sodium citrate dihydrate in water
Standard stock solution: 1.1052 mg/mL of USP Sodium Fluoride RS in water
Standard solution: Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer solution*, dilute with water to volume, and mix. Each mL of *Standard solution* contains 100 µg of fluoride ion.
Sample solution: Transfer 2.0 g of Ground Limestone to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 4.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL.
Electrode system: Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ± 0.2 mV (see *pH* (791)).
Analysis
Samples: *Standard solution* and *Sample solution*
Standard response line: Transfer 50.0 mL of *Buffer solution* and 4.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.
Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration, *C* (in µg/mL), of fluoride ion in the *Sample solution*. Calculate the content of fluoride in the portion of Ground Limestone taken:

$$\text{Result} = (C \times V)/W$$

C = concentration of fluoride ion, obtained from the *Standard response line*, in the *Sample solution* (µg/mL)

V = volume of the *Sample solution* (mL)
W = weight of Ground Limestone taken to prepare the *Sample solution* (g)
Acceptance criteria: NMT 50 ppm

SPECIFIC TESTS

• ACID-INSOLUBLE SUBSTANCES

Sample: 5.0 g

Analysis: Mix the *Sample* with 25 mL of water. Add 25 mL of hydrochloric acid, dropwise, with agitation, until it ceases to cause effervescence. Add water to make the mixture measure 200 mL, and filter. Wash the insoluble residue with water until the last washing shows no chloride, and ignite and weigh the residue.

Acceptance criteria: 0.2%–2.5%. The weight of the residue is between 10 and 125 mg.

- **LOSS ON DRYING** (731): Dry a sample at 200° for 4 h: it loses NMT 2.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Sodium Fluoride RS

Alpha Lipoic Acid

$C_8H_{14}O_2S_2$

206.33

Thiotoxic acid;
1,2-Dithiolane-3-pentanoic acid;
1,2-Dithiolane-3-valeric acid [1077-28-7].

DEFINITION

Alpha Lipoic Acid contains NLT 99.0% and NMT 101.0% of $C_8H_{14}O_2S_2$, calculated on the dried basis.

IDENTIFICATION

- **A.** The retention time of the peak for alpha lipoic acid of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B. INFRARED ABSORPTION** (197K)

ASSAY

• PROCEDURE

Buffer solution: 0.68 g/L of monobasic potassium phosphate

Mobile phase: Methanol, *Buffer solution*, and acetonitrile (58:46:9). Adjust with phosphoric acid solution (8.3 in 100) to a pH of 3.0–3.1.

Standard solution: 1.0 mg/mL of USP Alpha Lipoic Acid RS in *Mobile phase*

Sample solution: 1.0 mg/mL of Alpha Lipoic Acid in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 250-mm; packing L1

Column temperature: 35°

Flow rate: 1.2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 10,000 theoretical plates

Tailing factor: NMT 2.0 for the alpha lipoic acid peak

Relative standard deviation: NMT 2.0% for alpha lipoic acid

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of alpha lipoic acid ($C_8H_{14}O_2S_2$) in the portion of Alpha Lipoic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Alpha Lipoic Acid RS in the *Standard solution* (mg/mL)
 C_U = concentration of Alpha Lipoic Acid in the *Sample solution* (mg/mL)

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): Less than 0.1%

• **HEAVY METALS**, *Method II* (231): NMT 10 ppm

• CHROMATOGRAPHIC PURITY, PROCEDURE 1

Buffer solution, *Mobile phase*, *Standard solution*, *Sample solution*, and *Chromatographic system*:
Proceed as directed in the *Assay*.

Diluted standard solution: Dilute the *Standard solution* (1 in 1000) with *Mobile phase*.

System suitability

Sample: *Diluted standard solution*

Suitability requirements

Signal-to-noise ratio: NLT 10

Relative standard deviation: NMT 10.0%

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Alpha Lipoic Acid taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_T = sum of the responses of all the peaks from the *Sample solution*

Acceptance criteria

Individual impurities: NMT 0.1%

Total impurities: NMT 2.0%

• CHROMATOGRAPHIC PURITY, PROCEDURE 2

[NOTE—Use low-actinic glassware.]

Standard solution A: 40.0 mg/mL of USP Alpha Lipoic Acid RS in dimethylformamide

Standard solution B: 20.0 mg/mL of USP Alpha Lipoic Acid RS in dimethylformamide, prepared from the dilution of *Standard solution A*

Standard solution C: 10.0 mg/mL of USP Alpha Lipoic Acid RS in dimethylformamide, prepared from the dilution of *Standard solution B*

Sample solution: 40.0 mg/mL of Alpha Lipoic Acid in dimethylformamide

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: *n*-Propyl alcohol, ethyl acetate, water, and 25% ammonia water (40:40:10:5). Allow the chamber to become saturated for at least 1 h.

Iodine vapor-saturated chamber: Transfer 4 g of iodine crystals to a small watch glass, and place in a chromatographic chamber. Allow the chamber to become saturated for at least 2 h.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Proceed as directed in the chapter, except to develop until the solvent front has moved 10 cm. Remove the plate, and allow to air-dry until the ammonia disappears completely. Heat at 50° for 20 min, cool the plate, and place in the *Iodine vapor-saturated chamber* until the spots are visible. The R_f value for the alpha lipoic acid spot is 0.25–0.30 and for the polymeric lipoic acid spot is 0.

Acceptance criteria: No spot other than the alpha lipoic acid spot from the *Sample solution* is more intense than the spot at $R_f = 0$ from *Standard solution A*.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 60.0°–62.0°

• **OPTICAL ROTATION**, *Specific Rotation* (781S)

Sample solution: 50 mg/mL of Alpha Lipoic Acid, in dehydrated alcohol

Acceptance criteria: –1.0° to +1.0°

• **LOSS ON DRYING** (731): Dry a sample in vacuum at 40° for 3 h: it loses NMT 0.2% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Alpha Lipoic Acid RS

Alpha Lipoic Acid Capsules

DEFINITION

Alpha Lipoic Acid Capsules contain NLT 90.0% and NMT 115.0% of the labeled amount of $C_8H_{14}O_2S_2$.

IDENTIFICATION

• The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Alpha Lipoic Acid*.

STRENGTH

• CONTENT OF ALPHA LIPOIC ACID

Mobile phase: 0.025 M phosphoric acid and acetonitrile (62:38)

Standard solution: 0.05 mg/mL of USP Alpha Lipoic Acid RS in acetonitrile and water (1:1)

Sample solution A (for hard gelatin Capsules): Empty and mix thoroughly the contents of NLT 20 Capsules. Transfer a portion of the powder, equivalent to 100 mg of alpha lipoic acid, to a suitable container. Add 70 mL of a mixture of acetonitrile and water (1:1), and shake for 45 min by mechanical means. Transfer to a 100-mL volumetric flask, dilute with the mixture of acetonitrile and water (1:1) to volume, and filter a portion of this preparation, discarding the first 5 mL of the filtrate. Transfer 5.0 mL of the remaining filtrate to a 100-mL volumetric flask, and dilute with acetonitrile and water (1:1) to volume.

Sample solution B (for soft gelatin Capsules): Using a suitable cutting instrument, open a number of Capsules equivalent to 500 mg of alpha lipoic acid from a counted number of opened Capsules. Transfer the contents and the shells to a suitable container with stopper, add 500.0 mL of a mixture of acetonitrile and water (1:1), and shake for 45 min by mechanical means. Filter a portion of this preparation, discarding the first 5 mL of the filtrate. Transfer 5.0 mL of the remaining filtrate to a 100-mL volumetric flask, and dilute with acetonitrile and water (1:1) to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC
 Detector: UV 220 nm
 Column: 3.9-mm × 30-cm; packing L1
 Flow rate: 1.5 mL/min
 Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1300 theoretical plates
 Tailing factor: NMT 1.2 for alpha lipoic acid
 Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and appropriate *Sample solution*

Calculate the percentage of alpha lipoic acid in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from *Sample solution A* or *Sample solution B*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Alpha Lipoic Acid RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of alpha lipoic acid in *Sample solution A* or *Sample solution B* (mg/mL)

Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS**• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS**

<2040>: Meet the requirements for *Dissolution*

Medium: Water; 900 mL

Apparatus 1 (for hard gelatin Capsules): 100 rpm

Apparatus 2 (for soft gelatin Capsules): 75 rpm

Time: 60 min

Standard solution: 1 mg/mL of USP Alpha Lipoic Acid RS in a mixture of acetonitrile and water (1:1). Dilute with water to obtain a concentration of 0.02 mg/mL.

Sample solution: Withdraw a portion of the solution under test, and filter, discarding the first portion of the filtrate. Transfer an aliquot to a volumetric flask, and dilute with water to volume to obtain a solution having an expected concentration of 0.02 mg/mL of alpha lipoic acid.

Mobile phase and Chromatographic system: Proceed as directed in the test for *Content of Alpha Lipoic Acid*.

Injection size: 50 µL

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of alpha lipoic acid ($C_8H_{14}O_2S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (V \times C \times D/L) \times 100$$

Lutein

$C_{40}H_{56}O_2$ 568.87
 β - ϵ -Carotene-3,3'-diol (3R,3'R,6'R) [127-40-2].

DEFINITION

Lutein is the purified fraction obtained from saponification of the oleoresin of *Tagetes erecta* L. It contains NLT 80.0% of total carotenoids calculated as lutein ($C_{40}H_{56}O_2$). It contains NLT 74.0% of lutein and NMT 8.5% of zeaxanthin, both calculated as lutein ($C_{40}H_{56}O_2$) on the anhydrous basis.

IDENTIFICATION

- **A. ULTRAVIOLET-VISIBLE ABSORPTION <197U>**
Wavelength range: 300–700 nm
Sample solution: Prepare as directed for the *Sample solution* in the test for *Content of Total Carotenoids*.
Acceptance criteria: It meets the requirements in the chapter. The absorbance ratio A_{446}/A_{474} is 1.09–1.14.
- **B.** The retention time for the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Lutein*.

COMPOSITION

- **CONTENT OF TOTAL CAROTENOIDS**
[NOTE—Use low-actinic glassware.]
Diluent: Hexanes, acetone, toluene, and dehydrated alcohol (10:7:7:6)
Sample stock solution: 0.3 mg/mL of Lutein in *Diluent*
Sample solution: 3.0 μ g/mL of Lutein in dehydrated alcohol from dilution of *Sample stock solution*
Instrumental conditions
(See *Spectrophotometry and Light-Scattering <851>*.)

Mode: UV-Vis

Analytical wavelength: 446 nm

Blank: Dehydrated alcohol

Analysis

Sample: *Sample solution*

Calculate the percentage of total carotenoids (T) as lutein ($C_{40}H_{56}O_2$) in the portion of Lutein taken:

$$\text{Result} = A/(F \times C)$$

A = absorbance of the *Sample solution*
 F = coefficient of extinction ($E^{1\%}$) of lutein in alcohol ($100 \text{ mL} \cdot \text{g}^{-1} \cdot \text{cm}^{-1}$), 2550
 C = concentration of lutein in the *Sample solution* (g/mL)

Acceptance criteria: NLT 80.0%

- **CONTENT OF LUTEIN**

Mobile phase: Hexane and ethyl acetate (3:1)

Standard solution: 150 μ g/mL of USP Lutein RS in *Mobile phase*

Sample solution: Transfer 1 mL of the *Sample stock solution* from the test for *Content of Total Carotenoids*, and evaporate under a stream of nitrogen to dryness. Add 1 mL of *Mobile phase*, and sonicate to dissolve.

Chromatographic system

(See *Chromatography <621>*, *System Suitability*.)

Mode: LC

Detector: UV-Vis at 446 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L3

Flow rate: 1.5 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution* [NOTE—The relative retention times for lutein and zeaxanthin are about 1.0 and 1.05, respectively.]

Suitability requirements

Resolution: NLT 1.0 between lutein and zeaxanthin

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Sample: *Sample solution*

Calculate the percentage of the lutein peak as the total detected area in the portion of Lutein taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of lutein
 r_T = sum of the responses of all the peaks

Acceptance criteria: NLT 85%

Calculate the percentage of lutein in the portion of Lutein taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U = individual peak response
 r_T = sum of the responses of all the peaks
 T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Acceptance criteria: NLT 74.0% of lutein on the anhydrous basis

- **ZEAXANTHIN AND OTHER RELATED COMPOUNDS**

[NOTE—Use low-actinic glassware.]

Mobile phase, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in *Content of Lutein*.

Analysis

Sample: *Sample solution*

Calculate the percentage of zeaxanthin as the total detected area in the portion of Lutein taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of zeaxanthin
 r_T = sum of the responses of all the peaks

Acceptance criteria: NMT 9.0%

Calculate the percentage of zeaxanthin in the portion of Lutein taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U = peak response of zeaxanthin

r_T = sum of the responses of all the peaks

T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Calculate the percentage of other related compounds in the portion of Lutein taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = individual peak response of any other peak in the chromatogram (excluding zeaxanthin and lutein)

r_T = sum of the responses of all the peaks

Acceptance criteria: NMT 8.5% of zeaxanthin; NMT 1.0% of any other single related compound on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 2.0%
- **LEAD** (251): NMT 1 ppm
- **HEAVY METALS, Method II** (231): NMT 5 ppm

SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921): NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in hermetically sealed, light- and oxygen-resistant containers. Store in a cool place.
- **USP REFERENCE STANDARDS** (11)
USP Lutein RS

Lutein Preparation

DEFINITION

Lutein Preparation is a combination of Lutein with one or more inert substances. It may be in a solid or a liquid form. It contains NLT 95.0% and NMT 130.0% of the labeled amount of lutein, calculated as $C_{40}H_{56}O_2$ on the anhydrous basis. It contains NLT 85.0% of lutein and NMT 9.0% of zeaxanthin of the total carotenoid content.

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION** (197U)
Analytical wavelength: 300–700 nm
Sample solution: Prepare as directed for the *Sample solution* in the test for *Content of Total Carotenoids*.
Ratio: A_{446}/A_{474} , 1.09–1.14
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Lutein*.

COMPOSITION**• CONTENT OF TOTAL CAROTENOIDS**

Diluent: Hexanes, acetone, toluene, and dehydrated alcohol (10:7:7:6)

Sample stock solution A (for solid lutein preparations labeled as containing gelatin): Transfer an amount of Preparation, equivalent to 3.5 mg of lutein, to a 50-mL centrifuge tube. Add 15 mL of warm water, 60 units of bacterial alkaline protease preparation, and 1 mg of bromelain. Cap and sonicate for 20 min with occasional swirling. Cool to room temperature, and add 20.0 mL of methylene chloride. Shake for 1 min, and centrifuge for 5 min at 2000 rpm. Remove the upper aqueous phase, and add 2–3 g of anhydrous sodium sulfate to the remaining red layer.

Sample stock solution B (for other solid lutein preparations): Transfer an amount of Preparation, equivalent to 1.5 mg of lutein, to a 50-mL centrifuge tube. Add 15 mL of warm water, cap, and sonicate for 30 min with occasional swirling. Cool to room temperature, and add 30.0 mL of ethyl acetate and 2–3 g of sodium chloride. Shake for 1 min, and centrifuge for 5 min at 2000 rpm. Use the upper orange-red layer.

Sample stock solution C (for liquid lutein suspensions in oil): Transfer a weighed amount of Preparation equivalent to 20 mg of lutein to a 100-mL volumetric flask, and dilute with *Diluent* to volume. Add a magnetic bar, and stir for 30 min.

Sample solution: Transfer 1.0 mL of *Sample stock solution A*, or 1.0 mL of *Sample stock solution B*, or 1.0 mL of *Sample stock solution C* into a 100-mL volumetric flask, and dilute with dehydrated alcohol to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Analytical wavelength: 446 nm

Cell path: 1 cm

Blank: Dehydrated alcohol

Analysis

Sample: *Sample solution*

Calculate the percentage of total carotenoids (T) as lutein ($C_{40}H_{56}O_2$) in the Preparation:

$$\text{Result} = (A \times V \times D \times 100)/(F \times W)$$

A = absorbance of the *Sample solution*

F = absorptivity of the lutein in alcohol, 255.0 (mL/mg · cm)

V = volume of organic solvent (20.0 mL for *Sample stock solution A*, 30.0 mL for *Sample stock solution B*, and 100.0 mL for *Sample stock solution C*) used in preparing the *Sample stock solutions*

D = dilution factor used to prepare the *Sample solution* from *Sample stock solutions*

W = weight of Preparation taken to prepare the *Sample stock solutions* (mg)

• CONTENT OF LUTEIN

Diluent: Hexanes, acetone, toluene, and dehydrated alcohol (10:7:7:6)

Mobile phase: Hexane and ethyl acetate (75:25)

Standard solution: 150 µg/mL of USP Lutein RS in *Mobile phase*

Sample solution: Transfer 1.0 mL of *Sample stock solution A*, or 1.0 mL of *Sample stock solution B*, or 2.0 mL of *Sample stock solution C* from the test for *Content of Total Carotenoids* into a suitable vial. Evaporate the solvent to dryness under a stream of nitrogen. Add 1.0 mL of *Mobile phase*, and sonicate to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 446 nm

Column: 4.6-mm × 25-cm; 5-µm packing L3

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution* [NOTE—The relative retention times for lutein and zeaxanthin are about 1.0 and 1.05, respectively.]

Suitability requirements

Resolution: NLT 1.0 between lutein and zeaxanthin

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

Analysis

Sample: *Sample solution*

Calculate the percentage of lutein relative to total carotenoids in the Preparation taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = individual peak response of lutein
 r_T = sum of the responses of all the peaks
 Calculate the percentage of lutein in the Preparation taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U = individual peak response of lutein in the *Sample solution*
 r_T = sum of the responses of all the peaks
 T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Acceptance criteria: NLT 85.0% of lutein in the total carotenoid content, and the Preparation contains 95.0%–130.0% of the labeled amount of lutein, calculated as $C_{40}H_{56}O_2$, on the anhydrous basis.

• ZEAXANTHIN AND OTHER RELATED COMPOUNDS

Solvent, Mobile phase, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the test for *Content of Lutein*.

Analysis

Sample: *Sample solution*

Injection size: 10 μ L

Calculate the percentage of zeaxanthin relative to total carotenoids in the Preparation taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = individual peak response of zeaxanthin
 r_T = sum of the responses of all the peaks

Acceptance criteria

Zeaxanthin: NMT 9.0%

Any other single related compound: NMT 1.0%

Total related compounds (including zeaxanthin): NMT 15.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 2.0%
- **LEAD** (251): NMT 1 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tightly sealed, light- and oxygen-resistant containers. Store in a cool place.
- **LABELING:** The label states that this article is not intended for direct administration to humans or to animals.
- **USP REFERENCE STANDARDS** (11)
USP Lutein RS

Lycopene

$C_{40}H_{56}$ 536.88
 [502-65-8].

DEFINITION

Lycopene is a mixture of geometrical isomers of lycopene. It contains NLT 96.0% and NMT 101.0% of lycopene ($C_{40}H_{56}$), calculated on the dried basis.

IDENTIFICATION

- **A. ULTRAVIOLET-VISIBLE ABSORPTION** (197U)
Wavelength range: 300–700 nm
Test solution: Prepare as directed for the *Sample solution* in the test for *Content of Lycopene*.
Acceptance criteria: Meets the requirements in the chapter. The ratio of A_{476}/A_{508} is 1.10–1.14.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as

obtained in the test for *Content of all-E-Lycopene, 5Z-Lycopene, and Related Compounds*.

COMPOSITION

• CONTENT OF LYCOPENE

Sample stock solution: Transfer 25 mg of Lycopene and 25 mg of butylated hydroxytoluene into a 100-mL volumetric flask. Add 60 mL of methylene chloride, and sonicate to dissolve. Dilute with methylene chloride to volume.

Sample solution: Transfer 2.0 mL of the *Sample stock solution* into a 200-mL volumetric flask, and dilute with cyclohexane to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 476 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Calculate the percentage of lycopene ($C_{40}H_{56}$) in the portion of Lycopene taken:

$$\text{Result} = A_U/[(a \times C_U)] \times 100$$

A_U = absorbance of the *Sample solution*

a = absorptivity of the pure lycopene in cyclohexane, 331 ($\text{mL} \cdot \text{mg}^{-1} \cdot \text{cm}^{-1}$)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 96.0%–101.0% on the dried basis

• CONTENT OF ALL-E-LYCOPENE, 5Z-LYCOPENE, AND RELATED COMPOUNDS

Mobile phase: *tert*-Butyl methyl ether, methanol, and tetrahydrofuran (784:665:74)

Standard solution: Transfer a weighed quantity of USP Lycopene RS, equivalent to approximately 5 mg of lycopene, into a 250-mL volumetric flask. Add about 60 units of bacterial alkaline protease preparation or another suitable enzyme, and about 25 mg of butylated hydroxytoluene. Add 2.5 mL of dilute ammonium hydroxide (2 in 100) in water, and mix. Place in an ultrasonic bath at 50° for 10 min, rotate the flask occasionally to avoid having the material stick to the glass surface, and continue until the material is dispersed with no lumps. Add 5 mL of tetrahydrofuran, 40 mL of dehydrated alcohol, and mix. Place in an ultrasonic bath for about 1 min. Cool to room temperature, and dilute with *tert*-butyl methyl ether to volume. Shake vigorously, then allow the precipitate to settle. Filter the supernatant.

Sample stock solution: Transfer 15 mg of Lycopene to a 25-mL volumetric flask, and dissolve in tetrahydrofuran containing 50 mg/L of butylated hydroxytoluene. Dilute with the same solvent to volume.

Sample solution: Pipet 2 mL of the *Sample stock solution* into a 50-mL volumetric flask, and add 8 mL of tetrahydrofuran. Dilute with *tert*-butyl methyl ether to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 472 nm

Column: 4.6-mm \times 25-cm, 5- μ m packing L62; second column connected in series, 4.6-mm \times 25-cm, 3- μ m packing L62. [NOTE—New columns may require conditioning.]

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for all-E-lycopene and 5Z-lycopene peaks are 1.0 and about 1.07, respectively.]

Suitability requirements

Resolution: NLT 1.0 between all-*E*-lycopene and 5*Z*-lycopene peaks

Tailing factor: 0.8–2.0 for the all-*E*-lycopene peak

Relative standard deviation: NMT 2.0% for the all-*E*-lycopene peak

Analysis

Sample: *Sample solution*

Calculate the percentage of all-*E*-lycopene in the portion of Lycopene taken:

$$\text{Result} = (r_E/r_T) \times T$$

r_E = peak response of the all-*E*-lycopene isomer

r_T = sum of the responses of all the peaks

T = percentage of total lycopene isomers obtained in the test for *Content of Lycopene*

Acceptance criteria: NLT 70.0% of all-*E*-lycopene

Calculate the percentage of the 5*Z*-lycopene isomer in the portion of Lycopene taken:

$$\text{Result} = (r_{5Z}/r_T) \times T$$

r_{5Z} = peak response for the 5*Z*-lycopene isomer

r_T = sum of the responses of all the peaks

T = percentage of total lycopene isomers obtained in the test for *Content of Lycopene*

Acceptance criteria: NMT 23.0% of the 5*Z*-lycopene isomer

Calculate the percentage of related compounds in the portion of Lycopene taken:

$$\text{Result} = (r_S/r_T) \times T$$

r_S = sum of the responses of all peaks, except the peak for all-*E*-lycopene and the peak for 5*Z*-lycopene

r_T = sum of the responses of all the peaks

T = percentage of total lycopene isomers obtained in the test for *Content of Lycopene*

Acceptance criteria: NMT 9.0% of other related compounds calculated as lycopene

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.2%

• **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

• **LOSS ON DRYING** (731): Dry a sample in vacuum over phosphorus pentoxide at 40° for 4 h: it loses NMT 0.2% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, under inert gas, and store in a cool place.

• **LABELING:** Label it to indicate whether the article is obtained from natural sources or is prepared synthetically. If obtained from natural sources, label it to indicate the natural source, including its Latin binomial.

• **USP REFERENCE STANDARDS** (11)

USP Lycopene RS

Lycopene Preparation**DEFINITION**

Lycopene Preparation is a combination of Lycopene with one or more inert substances and suitable antioxidants. It may be in a solid or oily liquid form. It contains NLT 95.0% and NMT 120.0% of the labeled amount of lycopene (C₄₀H₅₆), calculated on the anhydrous basis.

IDENTIFICATION

• **A. ULTRAVIOLET-VISIBLE ABSORPTION** (197U)

Wavelength range: 300–700 nm

Test solution: Prepare as directed for the *Sample solution* in the test for *Content of Lycopene*.

Acceptance criteria: Meets the requirements in the chapter. The ratio A₄₇₆/A₅₀₈ is 1.10–1.14 in cyclohexane. The ratio A₄₇₂/A₅₀₄ is 1.09–1.13 in isopropyl alcohol.

COMPOSITION

• **CONTENT OF LYCOPENE**

Procedure for oily preparations

Sample stock solution: Transfer a weighed quantity of oily Preparation containing 25 mg of lycopene to a 100-mL volumetric flask. Add 25 mg of butylated hydroxytoluene and 60 mL of methylene chloride, and sonicate to dissolve. Dilute with methylene chloride to volume.

Sample solution: 2.0 mL of the *Sample stock solution* diluted with cyclohexane to 200.0 mL

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 476 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Calculate the percentage of the labeled amount of lycopene (C₄₀H₅₆) in the portion of Preparation taken:

$$\text{Result} = A_U/[(a \times C_U)] \times 100$$

A_U = absorbance of the *Sample solution*

a = absorptivity of the pure lycopene in cyclohexane, 331 (mL · mg⁻¹ · cm⁻¹)

C_U = nominal concentration of lycopene in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–120.0% on the anhydrous basis

Procedure for solid preparations

Sample stock solution: Transfer a weighed quantity of solid Preparation, equivalent to approximately 5 mg of lycopene, into a 200-mL volumetric flask. Add about 60 units of bacterial alkaline protease preparation, or another suitable enzyme, and about 25 mg of butylated hydroxytoluene. Add 2.5 mL of dilute ammonium hydroxide (2 in 100) in water, and mix. Place in an ultrasonic bath at 50° for 10 min, rotate the flask occasionally to avoid having the material stick to the glass surface, and continue until the material is dispersed with no lumps. Add 5 mL of tetrahydrofuran, 40 mL of dehydrated alcohol, and mix. Place in an ultrasonic bath for about 1 min. Cool to room temperature, and dilute with *tert*-butyl methyl ether to volume. Shake vigorously, then allow to stand until the solid has settled.

Sample solution: 2.0 mL of the *Sample stock solution* diluted with isopropyl alcohol to 25.0 mL

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 472 nm

Blank: Isopropyl alcohol

Analysis

Sample: *Sample solution*

Calculate the percentage of the labeled amount of lycopene in the portion of Preparation taken:

$$\text{Result} = A_U/[(a \times C_U)] \times 100$$

A_U = absorbance of the *Sample solution*

a = absorptivity of the pure lycopene in isopropyl alcohol, 320 (mL · mg⁻¹ · cm⁻¹)

C_U = nominal concentration of lycopene in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–120.0% on the anhydrous basis

Tomato Extract Containing Lycopene

DEFINITION

Tomato Extract Containing Lycopene is an ethyl acetate extract of the natural tomato lipids. It is produced from the pulp of ripe fruits of *Lycopersicon esculentum* Mill. (Fam. Solanaceae), after removing the tomato water-soluble fraction. It contains NLT 95.0% and NMT 105.0% of the labeled amount of lycopene (C₄₀H₅₆). It contains NLT 4.7% and NMT 12.0% of lycopene (C₄₀H₅₆), NLT 0.8% of the combined amount of phytofluene (C₄₀H₆₈) and phytoene (C₄₀H₆₄), NLT 0.2% of beta carotene (C₄₀H₅₆), and NLT 1.0% of tocopherols (C₂₈H₄₈O₂) on the anhydrous basis. Tocopherols may be added as antioxidants.

IDENTIFICATION

- **A. PRESENCE OF LYCOPENE, PHYTOFLUENE, AND PHYTOENE**

Analysis: Proceed as directed in the test for *Content of Other Carotenoids and Tocopherols*.

Acceptance criteria: The retention times of the peaks for lycopene, phytofluene, and phytoene from the *Sample solution* correspond to those from *Standard solution C*.

- **B. RATIO OF ALL-*E*-LYCOPENE AND 5Z-LYCOPENE**

Butylated hydroxytoluene stock solution: Proceed as directed in the test for *Content of Lycopene*.

Mobile phase: 0.05% diisopropylethylamine in *n*-hexane; sonicate for 3–4 min

Sample solution: Proceed as directed in the test for *Content of Lycopene*, except dilute 5 to 100 with *n*-hexane

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV-Vis 472 nm**Column:** Two 4.0-mm × 25-cm columns; 5-μm packing L3 (300 Å pore size), connected in a series**Column temperature:** 22°**Flow rate:** 0.5 mL/min**Injection size:** 10 μL[NOTE—The peak for all-*E*-lycopene elutes in 30–45 min.][NOTE—The relative retention times for all-*E*-lycopene and 5*Z*-lycopene are 1.00 in the range and 1.04–1.10, respectively.]**Analysis****Sample:** *Sample solution*

Measure the areas of the two major peaks, and calculate their area ratio:

$$\text{Result} = r_{U1}/r_{U2}$$

 r_{U1} = peak area of 5*Z*-lycopene r_{U2} = peak area of all-*E*-lycopene**Acceptance criteria:** NMT 0.10 for the area ratio**COMPOSITION****• CONTENT OF LYCOPENE****Butylated hydroxytoluene stock solution:** 5 mg/mL of butylated hydroxytoluene in methylene chloride.

[NOTE—This solution can be stored protected from light for up to 3 months.]

Mobile phase: Acetonitrile, methylene chloride, *n*-hexane, and methanol (850:25:25:100). Add 0.05% of diisopropylethylamine, mix, and sonicate for 3–4 min.**Diluent:** Acetonitrile, methylene chloride, *n*-hexane, butylated hydroxytoluene, and methanol (600:150:100:0.5:150). Add 0.05% of diisopropylethylamine, mix, and sonicate for 3–4 min.**Standard solution A:** Transfer a weighed quantity of USP Lycopene RS, equivalent to approximately 5 mg of lycopene, to a 100-mL volumetric flask. Add about 60 units of bacterial alkaline protease preparation, or another suitable enzyme, and about 25 mg of butylated hydroxytoluene. Add 2.5 mL of dilute ammonium hydroxide (2 in 100) in water, mix, and place in an ultrasonic bath at 50° for 10 min, rotating the flask occasionally to avoid having the material stick to the glass surface. Continue until the material is dispersed with no lumps. Add 5 mL of tetrahydrofuran, and shake until no colored precipitate remains. Add another portion of 2 mL of tetrahydrofuran and 40 mL of *Diluent*, and shake until the mixture is homogeneous. Dilute with *Diluent* to volume, shake vigorously, and allow to stand, if necessary, until the solid has settled. Calculate the exact concentration of this solution by the following method.**Standard solution B:** To 2.0 mL of *Standard solution A* add 10 mL of alcohol and 10 mL of *Butylated hydroxytoluene stock solution*, and dilute with *n*-hexane to 100 mL. Prepare in triplicate.Determine the absorbance of *Standard solution B* at the maximum absorbance at about 472 nm, using a mixture of alcohol, *Butylated hydroxytoluene stock solution*, and *n*-hexane (10:10:80) as the blank. Calculate the concentration of *Standard solution A*, in μg/mL, of lycopene:

$$\text{Result} = (A_x/F) \times 50,000$$

 A_x = average of the absorbance of the three preparations of *Standard solution B* F = absorptivity of pure lycopene in *n*-hexane at 472 nm, 345**Standard solution C:** Transfer a weighed quantity of USP Tomato Extract Containing Lycopene RS, equivalent to about 6 mg of lycopene, to a 100-mL volumetric flask, and dissolve in 1 mL of *Butylated hydroxytoluene stock solution* and 9 mL of methylene chloride, using a sonicator. Dilute with *Diluent* to volume to obtain a solution having a known concentration of about 0.06 mg/mL of lycopene.**Sample stock solution:** Warm the Tomato Extract Containing Lycopene to 50° in a water bath. Mix well with a glass rod or a spatula. Weigh and dissolve a quantity of 1–1.2 g of the sample in 10 mL of *Butylated hydroxytoluene stock solution* and 30 mL of methylene chloride, and sonicate the solution for 1 min to dissolve the sample completely. Cool to room temperature, and dilute with methylene chloride to 100 mL.**Sample solution:** Dilute the *Sample stock solution* with *Diluent* (1 in 10).**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV-Vis 472 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L7**Column temperature:** 39 ± 1°**Flow rate:** 0.7 mL/min**Injection size:** 10 μL**System suitability****Sample:** *Standard solution A*

[NOTE—The retention time for lycopene is about 6 min.]

Suitability requirements**Relative standard deviation:** NMT 1.5% for the lycopene peak area**Analysis****Samples:** *Standard solution A* or *Standard solution C*, and *Sample solution*

Measure the responses of the major lycopene peaks.

Calculate the percentage of lycopene in the portion of Tomato Extract Containing Lycopene taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times 100$$

 r_U = peak area for lycopene from the *Sample solution* r_S = peak area for lycopene from *Standard solution A* or *Standard solution C* C_S = concentration of lycopene in *Standard solution A* or *Standard solution C* (μg/mL) V = volume of the *Sample stock solution* (mL) W = weight of Tomato Extract Containing Lycopene taken to prepare the *Sample stock solution* (mg) D = dilution factor used to prepare the *Sample solution* from *Sample stock solution***Acceptance criteria:** NLT 95.0%–NMT 105.0% of the labeled amount of lycopene; NLT 4.7%–NMT 12.0% of lycopene (C₄₀H₅₆)**• CONTENT OF OTHER CAROTENOIDS AND TOCOPHEROLS (PHYTOFLUENE, PHYTOENE, BETA CAROTENE, AND TOCOPHEROLS)****Butylated hydroxytoluene stock solution, Diluent, Standard solution A, Standard solution B, Standard solution C, and Sample solution:** Proceed as directed in the test for *Content of Lycopene*.**Mobile phase:** Acetonitrile, methylene chloride, *n*-hexane, and methanol (19:1:1:19). Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Tomato Extract Containing Lycopene RS being used.

Relative standard deviation: NMT 2% for all-*E*-lycopene

Analysis

Samples: *Standard solution A* and *Sample solution*
Identify the locus of the peaks for the lycopene isomers, the beta carotene isomers, the phytofluene isomers, and phytoene by comparison with the reference chromatogram provided with the corresponding lot of USP Tomato Extract Containing Lycopene RS. Measure the sum of the peak responses of the lycopene isomers at 472 nm in *Standard solution A*. [NOTE—The lycopene isomers may be resolved in more than one peak in this chromatographic system.] In the *Sample solution*, measure the sum of the peak responses of the beta carotene isomers at 450 nm, the sum of the peak responses of the phytofluene isomers at 350 nm, the peak response of phytoene at 288 nm, and the sum of the peak responses of all tocopherols at 288 nm.

Determine the concentration of *Standard solution A* as directed in the test for *Content of Lycopene*.

Calculate the percentage of beta carotene in the portion of Tomato Extract Containing Lycopene taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times F \times 100$$

r_U = sum of the peak responses for the beta carotene isomers at 450 nm from the *Sample solution*

r_S = peak area for lycopene at 472 nm from *Standard solution A*

C_S = concentration of lycopene in *Standard solution A* (μg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Tomato Extract Containing Lycopene taken to prepare the *Sample stock solution* (mg)

D = dilution factor used to prepare the *Sample solution* from *Sample stock solution*

F = absorptivity ratio of pure lycopene to pure beta carotene, 345/259.2

Calculate the percentage of phytofluene in the portion of Tomato Extract Containing Lycopene taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times F \times 100$$

r_U = sum of the peak responses for phytofluene isomers at 350 nm from the *Sample solution*

r_S = sum of the peak responses for the lycopene isomers at 472 nm from *Standard solution A*

C_S = concentration of lycopene in *Standard solution A* (μg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Tomato Extract Containing Lycopene taken to prepare the *Sample stock solution* (mg)

D = dilution factor used to prepare the *Sample solution* from *Sample stock solution*

F = absorptivity ratio of pure lycopene to pure phytofluene, 345/135

Calculate the percentage of phytoene in the portion of Tomato Extract Containing Lycopene taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times F \times 100$$

r_U = area of the phytoene peak response at 288 nm from the *Sample solution*

r_S = sum of the peak responses for the lycopene isomers at 472 nm from *Standard solution A*

C_S = concentration of lycopene in *Standard solution A* (μg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Tomato Extract Containing Lycopene taken to prepare the *Sample stock solution* (mg)

D = dilution factor used to prepare the *Sample solution* from *Sample stock solution*

F = absorptivity ratio of pure lycopene to pure phytoene, 345/125

Calculate the percentage of tocopherols in the portion of Tomato Extract Containing Lycopene taken to prepare the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times F \times 100$$

r_U = sum of the peak responses for all the tocopherol peaks at 288 nm from the *Sample solution*

r_S = sum of the peak responses for the lycopene isomers at 472 nm from *Standard solution A*

C_S = concentration of lycopene in *Standard solution A* (μg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Tomato Extract Containing Lycopene taken to prepare the *Sample stock solution* (mg)

D = dilution factor used to prepare the *Sample solution* from *Sample stock solution*

F = absorptivity ratio of pure lycopene to the average absorptivity for tocopherols, 345/8.5

Acceptance criteria: NLT 0.8% of the combined amount of phytofluene (C₄₀H₆₈) and phytoene (C₄₀H₆₄), NLT 0.2% of beta carotene (C₄₀H₅₆), and NLT 1.0% of tocopherols (C₂₈H₄₈O₂), on the anhydrous basis

CONTAMINANTS

- **HEAVY METALS, Method II (231):** NMT 10 μg/g
- **ARTICLES OF BOTANICAL ORIGIN, Test for Aflatoxins (561):** NMT 4 ng/g of total aflatoxins B1, B2, G1, and G2; NMT 2 ng/g of aflatoxin B1
- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements
- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 2 × 10² cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Pseudomonas aeruginosa*.

SPECIFIC TESTS

CLARITY OF SOLUTION

Analysis: Warm the sample to 50° in a water bath. Mix well with a glass rod or a spatula, and transfer 1 g of the Extract directly into a 100-mL volumetric flask. Add 50 mL of methylene chloride, and sonicate the solution for 1 min to completely dissolve the sample. Bring to room temperature, and dilute with methylene chloride to volume.

Acceptance criteria: The solution is clear: no deposit or turbidity is formed.

ROTATIONAL RHEOMETER METHODS (912)

Analysis: Equilibrate the Tomato Extract Containing Lycopene at 37° in a 30-mL glass vial. Determine the viscosity using a rotational viscometer equipped with a spindle (No. 6) having a cylinder 1.47 cm in diameter

and 0.16 cm high attached to a shaft 0.32 cm in diameter, with a distance of 3.02 cm from the top of the cylinder to the lower tip of the shaft. The spindle is rotating at the appropriate speed and immersion depth to obtain a scale reading of 10%–90% of full scale. Calculate the viscosity, in centipoises, by multiplying the scale reading by the constant for the spindle and speed used.

Acceptance criteria: NMT 5000 centipoises

- **WATER DETERMINATION, Method 1a (921):** NMT 0.8%

- **PARTICLE SIZE DISTRIBUTION**

(See *Optical Microscopy* (776).)

Analysis: Transfer 1 drop to a microscope slide, and spread evenly. Isopropanol may be used as a diluent, if necessary. Examine the slide under a microscope equipped with a calibrated ocular micrometer, using 450× magnification. Scan the slide, and note the size of the individual particles.

Acceptance criteria: NLT 98% of the particles are less than 20 µm in length when measured along the longest axis, NLT 60% of the particles are less than 5 µm, and NLT 40% of the particles are less than 2 µm.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool place.
- **LABELING:** Label it to state the content of lycopene as a percentage and to state that the material should be heated to 50° and mixed before use. Label it to indicate the Latin binomial and the part of the plant from which the article is derived.
- **USP REFERENCE STANDARDS (11)**
 - USP Lycopene RS
 - USP Tomato Extract Containing Lycopene RS

Lysine Acetate—see *Lysine Acetate General Monographs*

Lysine Hydrochloride—see *Lysine Hydrochloride General Monographs*

Lysine Hydrochloride Tablets

DEFINITION

Lysine Hydrochloride Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of $C_6H_{14}N_2O_2 \cdot HCl$, as L-lysine hydrochloride.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.4 mg/mL of USP L-Lysine Hydrochloride RS in water

Sample solution: A filtered solution in water, equivalent to 0.4 mg/mL of lysine hydrochloride from powdered Tablets

Chromatographic system
(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 µL

Developing solvent system: Isopropyl alcohol and ammonium hydroxide (70:30)

Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the plate, and dry at 100°–105° until the ammonia disappears completely. Spray with *Spray reagent*, and heat at 100°–105° for 15 min. Examine the plate under white light.

Acceptance criteria: The R_f value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution*.

STRENGTH

• **PROCEDURE**

Sample: A portion of the powder from NLT 20 finely powdered Tablets, equivalent to 75 mg of lysine hydrochloride

Blank: Proceed as directed in the *Analysis* without the *Sample*.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric or visual

Analysis: Dissolve the *Sample* in 5 mL of mercuric acetate TS with gentle heating. Cool, then add 50 mL of glacial acetic acid. Add 3 drops of crystal violet TS when needed. Titrate with *Titrant*. Perform the *Blank* determination.

Calculate the percentage of the labeled amount of L-lysine hydrochloride ($C_6H_{14}N_2O_2 \cdot HCl$) in the portion of *Sample* taken:

$$\text{Result} = \{[(V_s - V_b) \times N \times F]/W\} \times 100$$

V_s = *Titrant* volume consumed by the *Sample* (mL)

V_b = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 91.33 mg/mEq

W = nominal amount of L-lysine hydrochloride in the *Sample* taken (mg)

Acceptance criteria: 90.0–120.0%

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION (2040):** Meet the requirements for *Disintegration*
Time: 20 min
- **WEIGHT VARIATION (2091):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
 - USP L-Lysine Hydrochloride RS

Magnesium Gluconate—see *Magnesium Gluconate General Monographs*

Magnesium Gluconate Tablets—see *Magnesium Gluconate Tablets General Monographs*

Malabar-Nut-Tree, Leaf

DEFINITION

Malabar-Nut-Tree, Leaf, also known in commerce as *vasaka*, consists of the dried leaves of *Justicia adhatoda* L., also known as *Adhatoda vasica* Nees (Fam. Acanthaceae). It contains NLT 0.6% of vasicine, calculated on the dried basis.

IDENTIFICATION

- A.** Malabar-Nut-Tree Leaf meets the requirements in *Specific Tests, Botanic Characteristics*.
- B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution A: 0.5 mg/mL of USP Vasicine RS in methanol. Sonicate to dissolve if necessary.
Standard solution B: 50 mg/mL of USP Powdered Malabar-Nut-Tree, Leaf Extract RS in methanol. Sonicate for about 15 min, centrifuge, and use the supernatant.
Sample solution: Transfer about 2.0 g of Malabar-Nut-Tree, Leaf, finely powdered and accurately weighed, to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 15 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume to 25 mL, using methanol.
 [NOTE—Save the filtrate for use in the test for *Content of Vasicine*.]

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates)

Application volume: 10 μL , as 4-mm bands

Developing solvent system: A mixture of ethyl acetate, methanol, and ammonia (8: 2: 0.2)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621), *Thin-Layer Chromatography*). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine under UV at 254 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a quenching zone at an R_f value of approximately 0.35 for vasicine, corresponding to a zone in the chromatogram of *Standard solution A*. The chromatogram of the *Sample solution* also exhibits an additional quenching zone at an R_f value of approximately 0.53 for vasicinone, corresponding to a similar zone in the chromatogram of *Standard solution B*. Other minor zones may be observed in the *Sample solution* and *Standard solution B* chromatograms.

- C. HPLC:** The chromatogram of the *Sample solution* from the test for *Content of Vasicine* shows a main peak at a retention time corresponding to that of vasicine in the chromatogram of *Standard solution A*. Identify other peaks in the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Malabar-Nut-Tree, Leaf Extract RS being used. The *Sample solution* shows an additional peak corresponding to vasicinone.

COMPOSITION

• CONTENT OF VASICINE

Buffer solution: Dissolve 1.36 g of anhydrous potassium dihydrogen phosphate in 900 mL of water. Add 2.0 mL of phosphoric acid. Dilute with water to 1000 mL, and filter.

Mobile phase: *Buffer solution*, acetonitrile, and tetrahydrofuran (92:5:3)

Standard solution A: 0.1 mg/mL of USP Vasicine RS in methanol. Sonicate to dissolve if necessary.

Standard solution B: 5.0 mg/mL of USP Powdered Malabar-Nut-Tree, Leaf Extract RS in methanol. Sonicate for about 15 min. Before injection, pass through a membrane filter of 0.45- μm or finer pore size.

Sample solution: Dilute the *Sample solution*, prepared as directed in *Identification test A* (1:5), with methanol. Before injection, pass through a membrane filter of 0.45- μm or finer pore size, and discard the first part of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L10

Flow rate: 1.0 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*
 [NOTE—The approximate relative retention times of the vasicine and vasicinone peaks are 1.00 and 1.23, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Malabar-Nut-Tree, Leaf Extract RS being used.

Resolution: NLT 2.0 between the vasicine and vasicinone peaks, *Standard solution B*

Relative standard deviation: NMT 2.0% determined from the vasicine peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered Malabar-Nut-Tree, Leaf Extract RS being used, identify the retention times of the peaks corresponding to vasicine and vasicinone. Calculate the percentage of vasicine in the portion of Malabar-Nut-Tree, Leaf taken:

$$\text{Result} = (r_u/r_s) \times C_s \times (V/W) \times 100$$

r_u = peak response of vasicine from the *Sample solution*

r_s = peak response of vasicine from *Standard solution A*

C_s = concentration of USP Vasicine RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Malabar-Nut-Tree, Leaf taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.6% on the dried basis

CONTAMINANTS

- HEAVY METALS, Method III (231):** NMT 20 ppm
- ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis (561):** Meets the requirements
- MICROBIAL ENUMERATION TESTS (2021):** The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.

- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Leaves, simple, green to dull grayish brown, minutely pubescent, lanceolate to ovate-lanceolate, tapering base and slightly acuminate apex, 10–20 cm long, 3–10 cm broad, petioles 2–8 cm long, and 8–10 pairs of reticulate lateral veins; characteristic odor, and bitter taste. Pharmacopeial article consists of dry, brittle, and greyish brown leaves.

Histology

Transverse section of leaves: Upper epidermal cells uniform in size and sinuous in outline, while lower epidermal cells vary in size and are less wavy; 4–6 layers of collenchymal cells below epidermis in the midrib region; shows two layers of palisade cells with elongated cystoliths, which are absent in epidermal cells (a diagnostic feature that is not seen in the leaves of *Ailanthus excelsa*, an adulterant for Malabar-Nut-Tree, Leaf); globules of oil dispersed in palisade and spongy layers; numerous stomata diacytic or anomocytic; glandular and non-glandular trichomes are visible on both epidermal layers.

- **LOSS ON DRYING (731):** Dry 1.0 g of finely powdered Malabar-Nut-Tree, Leaf at 105° for 3 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 21%, determined on 1.0 g of finely powdered Malabar-Nut-Tree, Leaf
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 2%
- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.
- **USP REFERENCE STANDARDS (11)**
USP Powdered Malabar-Nut-Tree, Leaf Extract RS
USP Vasicine RS

Powdered Malabar-Nut-Tree, Leaf

DEFINITION

Powdered Malabar-Nut-Tree, Leaf is Malabar-Nut-Tree, Leaf reduced to a powder or very fine powder. It contains NLT 0.6% of vasicine, calculated on the dried basis.

IDENTIFICATION

- **A.** Powdered Malabar-Nut Tree, Leaf meets the requirements in *Specific Tests, Botanic Characteristics*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution A: 0.5 mg/mL of USP Vasicine RS in methanol. Sonicate to dissolve if necessary.
Standard solution B: 50 mg/mL of USP Powdered Malabar-Nut-Tree, Leaf Extract RS in methanol. Sonicate for about 15 min, centrifuge, and use the supernatant.
Sample solution: Transfer about 2.0 g of Powdered Malabar-Nut-Tree, Leaf, accurately weighed, to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 15 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum, and adjust the volume to 25 mL, using methanol.

[NOTE—Save the filtrate for use in the test for *Content of Vasicine*.]

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates)

Application volume: 10 µL, as 4-mm bands

Developing solvent system: A mixture of ethyl acetate, methanol, and ammonia (8: 2: 0.2)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable thin-layer chromatographic plate (see *Chromatography (621)*, *Thin-Layer Chromatography*). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine under UV at 254 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a quenching zone at an R_f value of approximately 0.35 for vasicine, corresponding to a zone in the chromatogram of *Standard solution A*. Powdered Malabar-Nut-Tree, Leaf Extract

DEFINITION

Powdered Malabar-Nut-Tree, Leaf Extract is prepared from Malabar-Nut-Tree, Leaf using suitable solvents such as water, methanol, or a mixture of these solvents. The ratio of plant material to extract is between 8:1 and 5:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of vasicine. It may contain suitable added substances as carriers.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 0.5 mg/mL of USP Vasicine RS in methanol. Sonicate to dissolve if necessary.

Standard solution B: 50 mg/mL of USP Powdered Malabar-Nut-Tree, Leaf Extract RS in methanol. Sonicate for about 15 min, centrifuge, and use the supernatant.

Sample solution: 50 mg/mL of Powdered Malabar-Nut-Tree, Leaf Extract in methanol. Sonicate for about 15 min, centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates)

Application volume: 10 μL , as 4-mm bands

Developing solvent system: A mixture of ethyl acetate, methanol, and ammonia (8: 2: 0.2)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable thin-layer chromatographic plate (see *Chromatography (621)*, *Thin-Layer Chromatography*). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, and examine under UV at 254 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a quenching zone at an RF value of approximately 0.35 for vasicine, corresponding to a zone in the chromatogram of *Standard solution A*. The chromatogram of the *Sample solution* also exhibits an additional quenching zone at an RF value of approximately 0.53 for vasicinone, corresponding to a similar zone in the chromatogram of *Standard solution B*. Other minor zones may be observed in the *Sample solution* and *Standard solution B* chromatograms.

- **B. HPLC:** The chromatogram of the *Sample solution* from the test for *Content of Vasicine* shows a main peak at a retention time corresponding to that of vasicine in the chromatogram of *Standard solution A*. Identify other peaks in the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Malabar-Nut-Tree, Leaf Extract RS being used. The *Sample solution* shows an additional peak corresponding to vasicinone.

COMPOSITION

• CONTENT OF VASICINE

Buffer solution: Dissolve 1.36 g of anhydrous potassium dihydrogen phosphate in 900 mL of HPLC grade water. Add 2.0 mL of phosphoric acid. Dilute with water to 1000 mL, and filter.

Mobile phase: *Buffer solution*, acetonitrile, and tetrahydrofuran (92:5:3)

Standard solution A: 0.1 mg/mL of USP Vasicine RS in methanol. Sonicate to dissolve if necessary.

Standard solution B: 5.0 mg/mL of USP Powdered Malabar-Nut-Tree, Leaf Extract RS in methanol. Sonicate for about 15 min. Before injection, pass through a membrane filter of 0.45- μm or finer pore size.

Sample solution: 5.0 mg/mL of Powdered Extract in methanol. Sonicate for about 15 min. Before injection,

pass through a membrane filter of 0.45- μ m or finer pore size, and discard the first part of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L10

Flow rate: 1.0 mL/min

Injection size: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

[NOTE—The approximate relative retention times for vasicine and vasicinone peaks are 1.00 and 1.23, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Malabar-Nut-Tree, Leaf Extract RS being used.

USP Vasicine RS

Maritime Pine

DEFINITION

Maritime Pine consists of the bark of stems of *Pinus pinaster* Aiton (*Pinus maritima* Poir.) Fam. Pinaceae. It contains NLT 8.0% and NMT 12.0% of procyanidins, calculated on the dried basis.

[NOTE—This article is intended to be used in the preparation of extracts only and is not for direct human consumption.]

IDENTIFICATION

• A. PRESENCE OF PROCYANIDINS

Sample: Pulverize 1 g of the dried Maritime Pine. Use 10 mg.

Analysis: Add the *Sample* to 1 mL of methanol, and add 6 mL of a mixture of butanol and hydrochloric acid (95:5). Heat for 2 min in a water bath.

Acceptance criteria: The solution turns red.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 25 mg/mL of USP Maritime Pine Extract RS in alcohol [NOTE—Retain a portion of this solution for use in *Identification test C*.]

Sample solution: Add 2 g of the powdered dried material to 20 mL of water. Place in a water bath for 20 min, and centrifuge. Extract the supernatant with 40 mL of ethyl acetate. Evaporate the ethyl acetate layer to dryness under a stream of nitrogen, with gentle heating. Dissolve the residue so obtained in 0.25 mL of alcohol.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: Ethyl acetate, formic acid, and water (50:5:3)

Spray reagent: Alcohol and phosphoric acid (1:1), containing 1% of vanillin

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatograms, dry the plate with the aid of a current of air, spray the plate with the *Spray reagent*, and heat at 115° for 15 min.

Acceptance criteria: The chromatogram of the *Sample solution* presents three red bands appearing in the middle third of the chromatogram corresponding to two dimeric procyanidins and catechin at the same R_f of similar bands in the *Standard solution*. The chromatogram of the *Sample solution* also exhibits a blue band between the upper band due to upper dimeric procyanidins and the band due to catechin, at the same R_f of a similar band found in the chromatogram of the *Standard solution*.

• C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: Use the *Standard solution*, prepared as directed for *Identification test B*.

Standard solution B: 1 mg/mL each of ferulic acid and protocatechuic acid

Sample solution: Use the *Sample solution*, prepared as directed for *Identification test B*.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Methylene chloride, methanol, glacial acetic acid, and water (80:15:2:2)

Spray reagent: 5% ferric chloride solution in methanol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram, dry the plate at 110°, and examine the plate under short-wavelength and long-wavelength UV light. The chromatograms of *Standard solution A* and *Standard solution B* exhibit bands in the middle third and upper third that correspond to protocatechuic acid and ferulic acid, respectively. Spray the plate with the *Spray reagent*, and heat at 115° for 15 min. The bands due to ferulic acid and protocatechuic acid turn grayish green. Grayish-green bands become visible in the chromatogram of *Standard solution A* above and below protocatechuic acid, indicating the presence of caffeic acid and catechin, respectively.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits bands due to catechin, protocatechuic acid, caffeic acid, and ferulic acid that correspond in color and R_f values to those in the chromatogram of *Standard solution A* and *Standard solution B*.

COMPOSITION

• CONTENT OF PROCYANIDINS

Reagent solution A: Butanol and hydrochloric acid (95:5) [NOTE—Prepare this solution on the day of use.]

Reagent solution B: Dissolve 2 g of ferric ammonium sulfate in a mixture of 100 mL of water and 17.5 mL of hydrochloric acid. [NOTE—This solution can be used within 15 days of preparation.]

Standard solution: 95 µg/mL of procyanidins from USP Maritime Pine Extract RS in methanol

Sample stock solution: Dry crushed Maritime Pine at 110° for 3 h. Place 1.9 g of the crushed material in a 20-mL vial, and add 10 mL of methanol. Crimp the vial, and sonicate for 2 min. Heat in boiling water for 10 min. Cool to room temperature, allow the sediment to settle, and transfer the supernatant to a 100-mL volumetric flask, passing it through a filter having a 0.45-µm pore size. Wash the sediment two times with 10 mL of methanol, and transfer the solution into the same 100-mL volumetric flask, again passing it through a filter having a 0.45-µm pore size. Dilute with methanol to volume.

Sample solution: Dilute the *Sample stock solution* with methanol (1 in 20).

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Vis

Wavelength: 551 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 1.0 mL each of the *Standard solution*, *Sample solution*, and methanol to three separate 10-mL vials. To each vial add 6.0 mL of *Reagent solution A* and 0.25 mL of *Reagent solution B*. Seal the vials with crimp caps. Mix, and heat in a water bath for 40 min. Quickly cool to room temperature in an ice bath. Quantitatively transfer these solutions, with the aid of *Reagent solution A*, to three separate 10-mL volumetric flasks, and dilute with *Reagent solution A* to volume.

Determine the absorbance of the solutions obtained from the *Standard solution* and the *Sample solution*, using the methanol-containing solution as a blank.

Calculate the percentage of total procyanidins in the portion of Maritime Pine taken:

$$\text{Result} = (A_u/A_s) \times C_s \times (V/W) \times D \times P$$

A_u = absorbance of the solution from the *Sample solution*

A_s = absorbance of the solution from the *Standard solution*

C_s = concentration of the USP Maritime Pine Extract RS in the *Standard solution* (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Maritime Pine taken to prepare the *Sample stock solution* (mg)

D = dilution factor to prepare the *Sample solution* from *Sample stock solution*, 20

P = percentage of procyanidins in the USP Maritime Pine Extract RS

Acceptance criteria: 8.0%–12.0% on the dried basis

SPECIFIC TESTS

• BOTANICAL CHARACTERISTICS

Macroscopic: Bark pieces are typically 1–3 cm thick.

The inner bark is plane to slightly concave, whitish to light brown, striped longitudinally; shiny and of slightly irregular surface, only a few millimeters thick. Abrupt change to a sequence of hard, convex, nearly parallel layers alternating with smooth, light brown layers. Up to 50 or more layers present, depending on the age of the bark. Outer surface of bark is dark reddish brown composed of irregular scaly patches, with deep V-shaped fissures. Outer surface may also be gray, gray-green, or green-yellow due to presence of lichens.

Microscopic (transverse section of bark): Light inner bark has irregular lateral stripes consisting of 3–5 cell layers of long, slender sieve cells with large pitted horizontal cell walls and large polygonal parenchyma cells containing single, irregular, rounded starch grain, 3–15 mm wide. Lateral stripes are separated from each other by ray parenchyma cells. Ray parenchyma cells are homogeneous in appearance, 1–4 cell layers thick and 4–20 cell layers high, each cell containing single, irregular, rounded starch grain, 3–15 mm wide. Cylindrical parenchyma cells with thin cell walls arranged in vertical rows with calcium oxalate prisms are also present. Outer part of the inner bark contains plate-shaped cells of undifferentiated periderm and older periderm with multiple layers of phellogen. The phellogen grows 3–7 rows of phellum to the exterior and 2–4 rows of small cell phelloderm to the interior. The oldest and outermost part of the bark is composed of lignified sections of phelloderm and phellum cells, 15–35 mm thick, separated by collapsed phellogen. Phelloderm and phellum cells are up to 100 µm wide, square, rectangular, polygonal, or irregularly shaped. The cell walls are colorless. Phelloderm cells are moderately pitted with a reddish-brown content. Phellum cells have a thicker cell wall of strongly pitted, undulated contour, and a yellowish-brown to brownish-red content. Radially between layers of phelloderm and phellum are layers of ray parenchyma cells, 5–8 cells thick, rounded to radially stretched, thin walled, strongly pitted with collapsed cells and dead sieve cells.

• **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** <561>: NMT 5%

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 1.5%

• **ARTICLES OF BOTANICAL ORIGIN, Water Content** <561>: NMT 35.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Store at 25°, excursion permitted between 15° and 30°. Preserve in a well-closed container, and protect from moisture and excessive heat.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

• **USP REFERENCE STANDARDS** <11>
USP Maritime Pine Extract RS

Maritime Pine Extract

DEFINITION

Maritime Pine Extract is prepared from the pulverized Maritime Pine using suitable solvents. It contains NLT 65% and NMT 75% of procyanidins, calculated on the dried basis.

IDENTIFICATION

• A. PRESENCE OF PROCYANIDINS

Sample solution: Dissolve 50 mg of Extract in 6 mL of a mixture of butanol and hydrochloric acid (95:5).

Analysis: Heat for 2 min in a water bath.

Acceptance criteria: The solution turns red.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 25 mg/mL of USP Maritime Pine Extract RS in methanol

Standard solution B: 1 mg/mL each of ferulic acid and protocatechuic acid in methanol

Sample solution: 25 mg/mL of Extract in methanol

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: Methylene chloride, methanol, glacial acetic acid, and water (80:15:2:2)

Spray reagent: 5% ferric chloride solution in methanol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram, dry the plate at 110°, and examine the plate under short-wavelength and long-wavelength UV light. The chromatograms of *Standard solution A* and *Standard solution B* exhibit bands in the middle third and upper third that correspond to protocatechuic acid and ferulic acid, respectively.

Spray the plate with the *Spray reagent*, and heat at 115° for 15 min. The bands due to ferulic acid and protocatechuic acid turn grayish green. Grayish-green bands become visible in the chromatogram of *Standard solution A* above and below protocatechuic acid, indicating the presence of caffeic acid and catechin, respectively.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits bands due to catechin, protocatechuic acid, caffeic acid, and ferulic acid that correspond in color and R_f values to those in the chromatogram of *Standard solution A* and *Standard solution B*.

• C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: Use *Standard solution A*, prepared as directed for *Identification test B*.

Sample solution: Use the *Sample solution*, prepared as directed for *Identification test B*.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: Ethyl acetate, formic acid, and water (50:5:3)

Spray reagent: Phosphoric acid and alcohol (1:1), containing 1% of vanillin

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter, except to dry the plate with the aid of a current of air, spray the plate with the *Spray reagent*, and heat at 115° for 15 min. Three red bands appear in the middle third of the chromatogram of the *Standard solution* corresponding to two dimeric procyanidins and catechin. The chromatogram of the *Standard solution* also exhibits a blue band

between the upper band due to upper dimeric procyanidins and the band due to catechin.

Acceptance criteria: The chromatogram of the *Sample solution* contains bands that correspond to those found in the chromatogram of the *Standard solution*.

• D. HPLC IDENTIFICATION TEST

Solution A: Methanol

Solution B: 1 mg/mL of phosphoric acid in water

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	8	92
40	34	66
45	2	98
50	2	98
52	8	92
57	8	92

Standard solution: 2 mg/mL of USP Maritime Pine Extract RS in *Solution A*. Pass through a membrane having a 0.45- μ m or finer pore size.

Sample solution: Add 20 mg of Extract to 10 mL of *Solution A*, and sonicate for 10 min to dissolve. Pass through a membrane having a 0.45- μ m or finer pore size, discarding the first 4 mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 15-cm; base-deactivated packing L7, having less than 5- μ m particle size

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram is similar to the reference chromatogram provided with the lot of USP Maritime Pine Extract RS being used.

Resolution: NLT 3.0 between taxifolin and ferulic acid

Tailing factor: NMT 2.0 for taxifolin

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the peaks for catechin, caffeic acid, taxifolin, and ferulic acid by comparison of the chromatogram of the *Standard solution* with the reference chromatogram.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for catechin, caffeic acid, taxifolin, and ferulic acid at the retention times corresponding to those in the chromatogram of the *Standard solution*.

COMPOSITION

• CONTENT OF PROCYANIDINS

Reagent solution A: Butanol and hydrochloric acid (95:5) [NOTE—Prepare this solution on the day of use.]

Reagent solution B: Dissolve 2 g of ferric ammonium sulfate in a mixture of 100 mL of water and 17.5 mL of hydrochloric acid. [NOTE—This solution can be used within 15 days of preparation.]

Standard solution: 95 μ g/mL of procyanidins from USP Maritime Pine Extract RS in methanol

Sample stock solution: Transfer 250 mg of Extract to a 100-mL volumetric flask. Dissolve with methanol, and dilute with the same solvent to volume.

Sample solution: Dilute the *Sample stock solution* with methanol (1 in 20).

Instrumental conditions

(See *Spectrometry and Light Scattering* <851>.)

Mode: Vis

Wavelength: 551 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 1.0 mL each of the *Standard solution*, *Sample solution*, and methanol to three separate 10-mL vials. To each vial add 6.0 mL of *Reagent solution A* and 0.25 mL of *Reagent solution B*. Seal the vials with crimp caps. Mix, and heat in a water bath for 40 min. Quickly cool to room temperature in an ice bath. Quantitatively transfer these solutions, with the aid of *Reagent solution A*, to three separate 10-mL volumetric flasks, and dilute with *Reagent solution A* to volume.

Determine the absorbance of the solutions obtained from the *Standard solution* and the *Sample solution*, using the methanol-containing solution as a blank.

Calculate the percentage of total procyanidins in the portion of Extract taken:

$$\text{Result} = (A_U/A_S) \times C_S \times (V/W) \times D \times P$$

A_U = absorbance of the solution from the *Sample solution*

A_S = absorbance of the solution from the *Standard solution*

C_S = concentration of the USP Maritime Pine Extract RS in the *Standard solution* (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Maritime Pine Extract taken to prepare the *Sample stock solution* (mg)

D = dilution factor to prepare the *Sample solution* from *Sample stock solution*, 20

P = percentage of procyanidines in the USP Maritime Pine Extract RS

Acceptance criteria: 65%–75% on the dried basis

CONTAMINANTS

- **BOTANICAL EXTRACTS**, *Heavy Metals* (565): Meets the requirements
- **ARTICLES OF BOTANICAL ORIGIN**, *Pesticide Residue* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry 1.0 g of Extract for 3 h at 110°: it loses NMT 8.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 0.7%
- **LIMIT OF WATER-INSOLUBLE SUBSTANCES**
Analysis: Weigh 0.50 g of Extract, and stir in 50 mL of water at 20° for 15 min. Pass through a fine sintered glass filter, previously weighed. Dry the filter at 110° for 3 h, cool to room temperature, and weigh the filter. Calculate the amount of water-insoluble material.
Acceptance criteria: NMT 10% of the amount of Extract taken

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at 25°, excursion permitted between 15° and 30°. Protect from light.
- **LABELING:** The label states the Latin binomial and, following the official name of the article, the part of the plant from which the article was prepared, in addition to the information required for *Botanical Extracts* (565), *Labeling*.
- **USP REFERENCE STANDARDS** (11)
USP Maritime Pine Extract RS

Melatonin

$C_{13}H_{16}N_2O_2$

232.28

N-Acetyl-5-methoxytryptamine;

N-(2-(5-Methoxy-1*H*-indol-3-yl)ethyl) acetamide [73-31-4].

DEFINITION

Melatonin contains NLT 98.5% and NMT 101.5% of melatonin ($C_{13}H_{16}N_2O_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

- **B. ULTRAVIOLET ABSORPTION** (197U)

Analytical wavelength: 277 nm

Sample solution: 10 µg/mL of Melatonin in isopropyl alcohol

Acceptance criteria: Meets the requirements. Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

- **C. HPLC IDENTIFICATION TEST**

Analysis: Proceed as directed in the *Assay*.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

- **PROCEDURE**

Buffer: 0.5 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5, and filter.

Mobile phase: Acetonitrile and *Buffer* (25:75)

System suitability solution: 0.1 mg/mL of USP Melatonin RS and 0.02 mg/mL USP Melatonin Related Compound A RS in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Melatonin RS in *Mobile phase*

Sample solution: 0.1 mg/mL of Melatonin in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 222 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for melatonin related compound A and melatonin are 0.4 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4 between melatonin and melatonin related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of melatonin in the portion of Melatonin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Melatonin RS in the *Standard solution* (mg/mL)

C_U = concentration of Melatonin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.5–101.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **CHLORIDE AND SULFATE**, *Chloride* (221)
Standard: 0.10 mL of 0.020 N hydrochloric acid
Sample: 0.36 g of Melatonin
Acceptance criteria: NMT 0.02%
- **HEAVY METALS** (231): NMT 20 µg/g
- **RELATED COMPOUNDS**
Solution A: Acetonitrile
Solution B: Use *Buffer*, prepared as directed in the *Assay*.
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	25	75
7	25	75
15	80	20
18	25	75
25	25	75

Diluent: Mixture of *Solution A* and *Solution B* (25:75)

System suitability solution: 0.1 mg/mL of USP Melatonin RS and 0.02 mg/mL of USP Melatonin Related Compound A RS in *Diluent*

Standard solution: 5 µg/mL of USP Melatonin RS in *Diluent*

Sample solution: 1 mg/mL of Melatonin in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 222 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for melatonin related compound A and melatonin are 0.4 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between melatonin and melatonin related compound A

Relative standard deviation: NMT 2.0% for the melatonin peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Melatonin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of melatonin from the *Standard solution*

C_S = concentration of USP Melatonin RS in the *Standard solution* (mg/mL)

C_U = concentration of Melatonin in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: NMT 0.1%

Total impurities: NMT 1.0%

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample at 80° in a vacuum for 3 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.

• USP REFERENCE STANDARDS (11)

USP Melatonin RS

USP Melatonin Related Compound A RS

2-(5-Methoxy-1*H*-indol-3-yl)ethanamine.

$C_{11}H_{14}N_2O$ 190.24

Add the following:

▲ Melatonin Tablets

DEFINITION

Melatonin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of melatonin ($C_{13}H_{16}N_2O_2$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Strength*.

STRENGTH

• PROCEDURE

Buffer: 0.5 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5, and filter.

Mobile phase: Acetonitrile and *Buffer* (25:75)

System suitability solution: 0.1 mg/mL of USP Melatonin RS and 0.02 mg/mL of USP Melatonin Related Compound A RS in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Melatonin RS in *Mobile phase*

Sample solution: Filtered portion of the solution in *Mobile phase*, equivalent to 0.1 mg/mL of Melatonin from NLT 20 finely powdered Tablets

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 222 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

ASSAY

• PROCEDURE

Diluent: Transfer 950 mL of methanol to a 1-L volumetric flask. Add 0.60 mL of di(ethylene glycol) methyl ether, and dilute with methanol to volume.

Standard solution: 0.4 mg/mL of USP Methylsulfonylmethane RS in *Diluent*. Sonicate at 50° for 1 min, and allow to cool to room temperature.

Sample solution: 0.4 mg/mL of Methylsulfonylmethane in *Diluent*. Sonicate at 50° for 1 min, and allow to cool to room temperature.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary column coated with a 5-μm phase G2

Temperature

Column: 120°

Injector: 250°

Detector: 250°

Carrier gas: Helium

Flow rate: 5 mL/min

Split ratio: 2:1

Injection size: 1 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for the peak response ratio of methylsulfonylmethane to di(ethylene glycol) methyl ether from replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methylsulfonylmethane (C₂H₆O₂S) in the portion of Methylsulfonylmethane taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of methylsulfonylmethane to di(ethylene glycol) methyl ether from the *Sample solution*

R_S = peak response ratio of methylsulfonylmethane to di(ethylene glycol) methyl ether from the *Standard solution*

C_S = concentration of USP Methylsulfonylmethane RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylsulfonylmethane in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **HEAVY METALS, Method I** <231>: NMT 3 μg/g

• **CHROMATOGRAPHIC PURITY AND LIMIT OF DIMETHYL SULFOXIDE**

Standard stock solution: 1.0 mg/mL of USP Dimethyl Sulfoxide RS in methanol

Sensitivity check solution: 2.0 μg/mL from the *Standard stock solution* in methanol

System suitability solution: 0.1 mg/mL of USP Dimethyl Sulfoxide RS and 0.4 mg/mL of USP Methylsulfonylmethane RS in methanol. In a 50-mL volumetric flask dissolve 20 mg of USP Methylsulfonylmethane RS in 5 mL of the *Standard stock solution*, and dilute with methanol to volume.

Sample solution: 2 mg/mL of Methylsulfonylmethane in methanol. Sonicate at 50° for 1 min, and allow to cool to room temperature.

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Samples: *Sensitivity check solution* and *System suitability solution*

Suitability requirements

Signal-to-noise ratio: NLT 10 for dimethyl sulfoxide peak, *Sensitivity check solution*

Resolution: NLT 2.0 between dimethyl sulfoxide and methylsulfonylmethane, *System suitability solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Methylsulfonylmethane taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of each impurity in the *Sample solution*

r_T = sum of the responses of all of the peaks other than the solvent peak

Acceptance criteria

Individual impurities: NMT 0.1% of dimethyl

sulfoxide; NMT 0.05% of any other individual impurity

Total impurities: NMT 0.2% for all impurities, including dimethyl sulfoxide

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** <741>: 108.5°–110.5°

- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count is NMT 10³ cfu/g or mL, and the total combined molds and yeasts count is NMT 10² cfu/g or mL.

- **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements for absence of *Escherichia coli* in 10 g.

- **WATER DETERMINATION, Method I** <921>: NMT 0.1%.

[NOTE—500 mg of methylsulfonylmethane may be required for this analysis.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** <11>

USP Dimethyl Sulfoxide RS

USP Methylsulfonylmethane RS

Dimethyl sulfone.

C₂H₆O₂S 94.13

Methylsulfonylmethane Tablets

DEFINITION

Methylsulfonylmethane Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methylsulfonylmethane (C₂H₆O₂S).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Procedure for Strength*.

STRENGTH

• **PROCEDURE**

Diluent: Transfer 950 mL of methanol to a 1-L volumetric flask. Add 0.60 mL of diethylene glycol methyl ether, and dilute with methanol to volume.

Standard solution: 0.4 mg/mL of USP Methylsulfonylmethane RS in *Diluent*. Sonicate at 50° for 1 min, and allow to cool to room temperature.

Sample solution: Finely powder NLT 20 Tablets. Dissolve a portion of the finely powdered material, equivalent to 1 Tablet, in *Diluent*, and sonicate for 15 min at 50°. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Quantitatively dilute with *Diluent* to obtain a final concentration of 0.4 mg/mL of methylsulfonylmethane. Transfer 1 mL of the suspension to a 1.5-mL microcentrifuge tube, and centrifuge for 20 s. Use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary; 5-μm phase G2 coating

Temperature

Column: 120°

Injector: 250°

Detector: 250°

Carrier gas: Helium

Flow rate: 5 mL/min

Injection size: 1 µL

Injector type: Split ratio, 2:1

System suitabilitySample: *Standard solution***Suitability requirements**

Relative standard deviation: NMT 2.0% for the peak response ratio of methylsulfonylmethane to diethylene glycol methyl ether from replicate injections

AnalysisSamples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylsulfonylmethane (C₂H₆O₂S) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (peak response of methylsulfonylmethane to diethylene glycol methyl ether) from the *Sample solution*

R_S = internal standard ratio (peak response of methylsulfonylmethane to diethylene glycol methyl ether) from the *Standard solution*

C_S = concentration of USP Methylsulfonylmethane RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methylsulfonylmethane in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION** (2040): Meet the requirements for *Disintegration*; 30 min
- **WEIGHT VARIATION** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Methylsulfonylmethane RS
Dimethyl sulfone.
C₂H₆O₂S 94.13

Milk Thistle**DEFINITION**

Milk Thistle consists of the dried ripe fruit of *Silybum marianum* (L.) Gaertn. (Fam. Asteraceae), the pappus having been removed. It contains NLT 2.0% of silymarin, calculated as silybin (C₂₅H₂₂O₁₀), on the dried basis.

IDENTIFICATION• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 1.0 mg/mL of USP Silydianin RS in methanol

Sample solution: Use the *Sample solution*, prepared as directed in the test for *Content of Silymarin*.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25 mm layer of chromatographic silica gel, typically 20 cm long (TLC plates)

Application volume: 10 µL

Developing solvent system: Freshly prepared mixture of chloroform, acetone, and anhydrous formic acid (75:16.5:8.5)

Spray reagent A: 10-mg/mL solution of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50-mg/mL solution of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved about three-fourths of the plate, and dry it for 30 min in a current of cold air. Spray the plate with *Spray reagent A*, allow to dry, and then spray with *Spray reagent B*. One h later, examine the plate under long-wavelength UV light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits an intense green-blue fluorescent zone at an R_f value of about 0.5 (presence of silybin) and exhibits a gray-blue spot at an R_f value of about 0.4, corresponding to a spot observed in the chromatogram of the *Standard solution*. The chromatogram of the *Sample solution* may exhibit other colored zones: an intense green-blue zone at an R_f value of about 0.25 (presence of silychristin) and a red-orange zone at an R_f value of about 0.3 (presence of taxifolin).

• **B. HPLC IDENTIFICATION TEST**

Analysis: Proceed as directed for *Content of Silymarin*.

Acceptance criteria: The retention times of the peaks for silydianin, silychristin, silybin A, silybin B, isosilybin A, and isosilybin B in the chromatogram of the *Sample solution* correspond to those in the chromatogram of the *Milk thistle standard solution*.

COMPOSITION• **CONTENT OF SILYMARIN**

Solution A: Methanol, phosphoric acid, and water (20: 0.5: 80)

Solution B: Methanol, phosphoric acid, and water (80: 0.5: 20)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	0	0
5	85	15
20	55	45
40	55	45
41	85	15
55	85	15

Milk thistle standard solution: 0.7 mg/mL of USP Powdered Milk Thistle Extract RS in methanol. Sonicate for 20 min to dissolve. Pass through a membrane filter having a 0.45-µm or finer pore size. Dilute 1 in 5 with methanol to obtain a solution of 0.14 mg/mL of USP Powdered Milk Thistle Extract RS.

Silybin standard solutions: 0.20, 0.02, and 0.004 mg/mL of USP Silybin RS in methanol. Pass through a membrane filter having a 0.45-µm or finer pore size.

Sample stock solution: Transfer 10 g of finely powdered Milk Thistle to an extraction thimble, and cover with a small cotton ball. Transfer the thimble to a continuous-extraction apparatus fitted with a 250-mL round-bottom flask containing 150 mL of solvent hexane, and heat the flask on a heating mantle for 4 h. After the extraction, separate the round-bottom flask containing solvent hexane extract from the extraction apparatus, and discard the solvent hexane solution. Remove the adherent solvent hexane from the extraction thimble by drying, and transfer the thimble to an extraction apparatus suitable for hot extraction and fitted with a 250-mL round-bottom flask containing 100 mL of ethyl acetate. [NOTE—Adjust the volume of ethyl acetate, if necessary, to sustain a continuous extraction.] Heat the flask on a heating mantle to allow the solvent to reflux gently. After 8 h, transfer the extract quantita-

tively into a 100-mL volumetric flask, and dilute with methanol to volume.

Sample solution: Dilute the *Sample stock solution* (1 in 25) with methanol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 288 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Milk thistle standard solution*

[NOTE—For the relative retention times, see *Table 2*.]

Table 2

	Relative Retention Time
Silychristin	0.68
Silydianin	0.73
Silybin A	1.00
Silybin B	1.05
Dehydrosilybin	1.09
Isosilybin A	1.15
Isosilybin B	1.19

Suitability requirements

Chromatogram similarity: The chromatogram from the *Milk thistle standard solution* is similar to the reference chromatogram provided with the lot of USP Powdered Milk Thistle Extract RS being used.

Resolution: NLT 1.0 between silybin A and silybin B

Tailing factor: 0.8–2.0

Relative standard deviation: NMT 2.0% for the sum of peak responses due to silybin A and silybin B

Analysis

Samples: *Milk thistle standard solution*, each of the *Silybin standard solutions*, and *Sample solution*
Identify the peaks due to silychristin, silydianin, silybin A, silybin B, isosilybin A, and isosilybin B by comparison with the chromatogram of the *Milk thistle standard solution*, and measure the peak areas of the relevant peaks. Plot the areas of the sum of silybin A and silybin B peaks versus the concentration of USP Silybin RS in the *Silybin standard solutions*, and obtain a regression line for calibration.

Separately calculate the percentage of each relevant component of silymarin as silibin (C₂₅H₂₂O₁₀) in the portion of Milk Thistle taken:

$$\text{Result} = C \times (V/W) \times D \times 100$$

C = concentration of the relevant component in the *Sample solution* as interpolated from the calibration graph (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of the portion of Milk Thistle taken (mg)

D = dilution factor to prepare the *Sample solution* from *Sample stock solution*, 25

Calculate the content of silymarin, as a percentage, in the portion of Milk Thistle taken by adding the individual percentages.

Acceptance criteria: NLT 2.0% of silymarin, calculated as silybin (C₂₅H₂₂O₁₀), on the dried basis

CONTAMINANTS

• **HEAVY METALS** <231>: NMT 10 μg/g

• **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** <561>: Meets the requirements

• **MICROBIAL ENUMERATION TESTS** <2021>: The total bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli* and for absence of *Staphylococcus aureus*.

SPECIFIC TESTS

• **BOTANIC CHARACTERISTICS**

Macroscopic: The fruits (achenes) are elongated ovoid, slightly crooked, somewhat flattened, roughly 6–7 mm in length, up to 3 mm in width, and 1.5 mm in thickness, and have a projecting cartilaginous, glossy, yellowish edge on the upper surface and a grooved hilum at the base. The fruit coat is glossy brown-black or mat gray-brown with dark or pale gray streaks; it encloses the straight embryo having two thick, flattened cotyledons that contain fatty oil and aleurone granules.

Microscopic: The fruit wall epidermis consists of almost colorless palisade cells arranged at right angles to the surface. They have greatly thickened outer walls, into which the lumen continues for some distance in the form of a slit. Viewed from above under high magnification, the cells show only a slit-shaped lumen. They have thickened ridges that appear as nodular thickenings of the cell wall when viewed from above. The subepidermal layer of the fruit wall is made up of unlignified thin-walled parenchymal cells and constitutes a pigment layer. Colorless cells and groups of cells alternate with pigment cells, the latter varying in number; this gives the fruit wall its mottled appearance. Next comes the fruit wall tissue, about 8 cell layers thick, with stippled parenchymal cells elongated in the longitudinal axis of the fruit. The cells of the innermost layer of the fruit wall may be collapsed; they contain large cigar-shaped or monoclinic calcium oxalate prisms. The seed coat epidermis is formed from large yellow palisade cells. The cells have a narrow lumen, somewhat expanded at each end of the cell, and the cell walls show conspicuous lamination. The subepidermal cells of the seed coat consist of peculiar stippled cells; their lignified cell membranes have prominent, close-set ridges or thickenings (“net cells”). Next to them is a single layer of cells having tough, somewhat swollen walls and lipophilic contents (endosperm residue). The embryo consists of thin-walled cells that, in addition to small glands, contain clumps of crystals and fat droplets.

• **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** <561>: NMT 2.0%

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 8.0%, determined on 1.0 g of finely powdered Milk Thistle

• **LOSS ON DRYING** <731>: Dry 1.0 g of finely powdered Milk Thistle at 105° for 2 h: it loses NMT 8.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture.

• **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

• **USP REFERENCE STANDARDS** <11>

Powdered Milk Thistle Extract

DEFINITION

Powdered Milk Thistle Extract is prepared from Milk Thistle fruits or seeds by fat removal and subsequent extraction with suitable solvents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of silymarin, calculated as silybin ($C_{25}H_{22}O_{10}$), on the dried basis, consisting of NLT 20.0% and NMT 45.0% for the sum of silydianin and silychristin, NLT 40.0% and NMT 65.0% for the sum of silybin A and silybin B, and NLT 10.0% and NMT 20.0% for the sum of isosilybin A and isosilybin B.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 1.0 mg/mL of USP Silydianin RS in methanol

Sample solution: 10 mg/mL of Powdered Extract in methanol, and allow to stand for 15 min before use.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long

Application volume: 10 µL

Developing solvent system: Freshly prepared mixture of chloroform, acetone, and anhydrous formic acid (75:16.5:8.5)

Spray reagent A: 10-mg/mL solution of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50-mg/mL solution of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved about three-fourths of the plate, and dry it for 30 min in a current of cold air. Spray the plate with *Spray reagent A*, allow to dry, and then spray with *Spray reagent B*. One h later, examine the plate under long-wavelength UV light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits an intense green-blue fluorescent zone at an R_f value of about 0.5 (presence of silybin) and exhibits a gray-blue spot at an R_f value of about 0.4, corresponding to a spot observed in the chromatogram of the *Standard solution*. The chromatogram of the *Sample solution* may exhibit other colored zones: an intense green-blue zone at an R_f value of about 0.25 (presence of silychristin) and a red-orange zone at an R_f value of about 0.3 (presence of taxifolin).

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Silymarin*.

Acceptance criteria: The retention times of the peaks for silydianin, silychristin, silybin A, silybin B, isosilybin A, and isosilybin B in the chromatogram of the *Sample solution* correspond to those in the chromatogram of the *Milk thistle standard solution*.

COMPOSITION

55	85	15

Milk thistle standard solution: 0.7 mg/mL of USP Powdered Milk Thistle Extract RS in methanol. Sonicate for 20 min to dissolve.

Silybin standard solutions: 0.20, 0.02, and 0.004 mg/mL of USP Silybin RS in methanol. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Sample solution: Dissolve a sample of Extract in methanol to obtain a solution equivalent to 0.4 mg/mL of silymarin. Sonicate for 20 min, cool to 20°, and pass through a filter of 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 288 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Milk thistle standard solution*

[NOTE—For the relative retention times, see *Table 2*.]

Table 2

	Relative Retention Time
Silychristin	0.68
Silydianin	0.73
Silybin A	1.00
Silybin B	1.05
Dehydrosilybin	1.09
Isosilybin A	1.15
Tsosilybin B	1.19

Suitability requirements

Chromatogram similarity: The chromatogram from the *Milk thistle standard solution* is similar to the reference chromatogram provided with the lot of USP Powdered Milk Thistle Extract RS being used.

Resolution: NLT 1.0 between silybin A and silybin B

Tailing factor: 0.8–2.0

Relative standard deviation: NMT 2.0% for the sum of peak responses due to silybin A and silybin B

Analysis

Samples: *Milk thistle standard solution*, each of the *Silybin standard solutions*, and *Sample solution*

Identify the peaks due to silychristin, silydianin, silybin A, silybin B, isosilybin A, and isosilybin B by comparison with the chromatogram of the *Milk thistle standard solution*, and measure the peak areas of the relevant peaks. Plot the areas of the sum of silybin A and silybin B peaks versus the concentration of USP Silybin RS in the *Silybin standard solutions*, and obtain a regression line for calibration.

Separately calculate the percentage of each relevant component of silymarin as silybin ($C_{25}H_{22}O_{10}$) in the portion of Powdered Extract taken:

$$\text{Result} = C \times (V/W) \times 100$$

C = concentration of the relevant component in the *Sample solution* as interpolated from the calibration graph (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of the portion of Powdered Extract taken (mg)

Calculate the percentage of the labeled amount of silymarin in the portion of Powdered Extract taken:

$$\text{Result} = \Sigma S/L \times 100$$

ΣS = sum of the percentages of the each relevant component of silymarin

L = labeled amount of silymarin, as a percentage, in the Powdered Extract

Acceptance criteria: 90.0%–110.0% of the labeled amount of silymarin, calculated as silybin ($C_{25}H_{22}O_{10}$), on the dried basis, consisting of: 20.0%–45.0% for the sum of silydianin and silychristin; 40.0%–65.0% for the sum of silybin A and silybin B; and 10.0%–20.0% for the sum of isosilybin A and isosilybin B

CONTAMINANTS

- **HEAVY METALS, Method II <231>:** NMT 20 μ g/g
- **MICROBIAL ENUMERATION TESTS <2021>:** The total bacterial count does not exceed 10^4 /g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the enterobacterial count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.
- **OTHER REQUIREMENTS:** It meets the requirements in *Botanical Extracts* <565> for the tests in sections *Pesticide Residues* and *Residual Solvents*.

SPECIFIC TESTS

- **LOSS ON DRYING <731>:** Dry a sample at 105° for 2 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a cool place.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. It meets the requirements for *Botanical Extracts* <565>, *Labeling*.
- **USP REFERENCE STANDARDS <11>**
USP Powdered Milk Thistle Extract RS
USP Silybin RS
USP Silydianin RS

Milk Thistle Capsules

DEFINITION

Milk Thistle Capsules are prepared from Powdered Milk Thistle Extract. They contain NLT 90.0% and NMT 110.0% of the labeled amount of silymarin as silybin ($C_{25}H_{22}O_{10}$), calculated as the sum of silydianin, silychristin, silybin A, silybin B, isosilybin A, and isosilybin B.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution: 1.0 mg/mL of USP Silydianin RS in methanol
Sample solution: Equivalent to 5 mg/mL of silymarin from powdered Capsule contents (finely powder the contents of NLT 20 Capsules) in methanol. Shake for 1 min, and sonicate for 10 min. Allow to stand for 15 min before use.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel, typically 20 cm long

Application volume: 10 μ L

Developing solvent system: Freshly prepared mixture of chloroform, acetone, and anhydrous formic acid (75:16.5:8.5)

Spray reagent A: 10-mg/mL solution of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50-mg/mL solution of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms until the solvent front has moved about three-fourths of the plate, and dry it for 30 min in a current of cold air. Spray the plate with *Spray reagent A*, allow to dry, and then spray with *Spray reagent B*. One h later, examine the plate under long-wavelength UV light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits an intense green-blue fluorescent zone at an R_f value of 0.5 (presence of silybin) and exhibits a gray-blue spot at an R_f value of 0.4, corresponding to a spot observed in the chromatogram of the *Standard solution*. The chromatogram of the *Sample solution* may exhibit other colored zones: an intense green-blue zone at an R_f value of 0.25 (presence of silychristin) and a red-orange zone at an R_f value of 0.3 (presence of taxifolin).

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed for *Content of Silymarin*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for silydianin, silychristin, silybin A, silybin B, isosilybin A, and isosilybin B at retention times that correspond to those of the *Milk thistle standard solution*.

STRENGTH

• CONTENT OF SILYMARIN

Solution A: Methanol, phosphoric acid, and water (20:0.5:80)

Solution B: Methanol, phosphoric acid, and water (80:0.5:20)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	0	0
5	85	15
20	55	45
40	55	45
41	85	15
55	85	15

Milk thistle standard solution: 0.7 mg/mL of USP Powdered Milk Thistle Extract RS in methanol. Sonicate for 20 min to dissolve.

Silybin standard solutions: 0.20, 0.02, and 0.004 mg/mL of USP Silybin RS in methanol. Pass through a membrane filter having a 0.45- μ m or finer pore size.

Sample solution: Weigh and finely powder the contents of NLT 20 Capsules. Transfer an accurately weighed quantity of the powder equivalent to 100 mg of silymarin to a 100-mL volumetric flask, add 90 mL of methanol, and sonicate for 20 min with occasional shaking. Cool to 20°, and dilute with methanol to volume. Filter through a membrane with a 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 288 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Milk thistle standard solution*

[NOTE—For the relative retention times, see *Table 2*.]

Table 2

Name	Relative Retention Time
Silychristin	0.68
Silydianin	0.73
Silybin A	1.00
Silybin B	1.05
Dehydrosilybin	1.09
Isosilybin A	1.15
Isosilybin B	1.19

Suitability requirements

Chromatogram similarity: The chromatogram from the *Milk thistle standard solution* is similar to the reference chromatogram provided with the lot of USP Powdered Milk Thistle Extract RS being used.

Resolution: NLT 1.0 between silybin A and silybin B

Tailing factor: 0.8–2.0

Relative standard deviation: NMT 2.0% for the sum of peak responses due to silybin A and silybin B

Analysis

Samples: *Milk thistle standard solution*, each of the *Silybin standard solutions*, and *Sample solution*

Identify the peaks due to silychristin, silydianin, silybin A, silybin B, isosilybin A, and isosilybin B by comparison of the chromatogram of the *Milk thistle standard solution* with the reference chromatogram, and measure the peak areas of the relevant peaks. Plot the areas of the sum of silybin A and silybin B peaks versus the concentration of USP Silybin RS in the *Silybin standard solutions*, and obtain a regression line for calibration.

Separately calculate the content, in mg, of each relevant component of silymarin as silybin ($C_{25}H_{22}O_{10}$) in the portion of contents of Capsules taken:

$$\text{Result} = C \times V$$

C = concentration of the relevant component in the *Sample solution* as interpolated in the calibration graph (mg/mL)

V = volume of the *Sample solution* (mL)

Calculate the content of silymarin, as a percentage, in the portion of Capsules taken:

$$\text{Result} = C_s \times (A_{wc}/W) \times (100/L)$$

C_s = sum of the contents of each relevant component of silymarin in the portion of contents of Capsules taken (mg)

A_{wc} = average weight of the contents of Capsules (mg/Tablet)

W = weight of the portion of content of Capsules taken (mg)

L = labeled amount of silymarin (mg/Capsule)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Dissolution*

Buffer: 6.9 g/L of monobasic sodium phosphate and 1.52 g/L of sodium hydroxide in water. Adjust to a pH of 7.5.

Medium: Buffer containing 2% lauryl sulfate; 900 mL

Apparatus 2: 100 rpm

Time: 45 min

Determine the amount of silymarin as silybin ($C_{25}H_{20}O_{10}$) dissolved by using the method in the test for *Content of Silymarin*, making any necessary modifications.

Tolerances: NLT 75% of the labeled amount of silymarin as silybin ($C_{25}H_{20}O_{10}$) is dissolved.

- **WEIGHT VARIATION (2091):** Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS (2021):** The total bacterial count does not exceed 10^4 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the enterobacterial count does not exceed 10^2 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the content of silymarin, in mg/Capsule.
- **USP REFERENCE STANDARDS (11)**
USP Powdered Milk Thistle Extract RS
USP Silybin RS

Minerals Capsules

DEFINITION

Minerals Capsules contain two or more minerals derived from substances generally recognized as safe, furnishing two or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc. Capsules contain NLT 90.0% and NMT 125.0% of the labeled amounts of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V). They contain no vitamins. They may contain other labeled added substances in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used. Commercially available atomic absorption standard solutions for the minerals, where applicable, may be used where preparation of a *Standard stock solution* is described in the following assays. Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the concentrations of the *Standard solutions* and the *Sample solutions* may be modified to fit the linear or working range of the instrument.]

- **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution* and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Polysorbate 80 solution: Dilute Polysorbate 80 with alcohol (1 in 10)

Sample solution: Transfer 5 Capsules to a 100-mL volumetric flask. [NOTE—For hard gelatin Capsules, weigh NLT 20 Capsules. Open the Capsules, without loss of shell material, and transfer the contents to a suitable container. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and allow the Capsule shells to dry. Weigh the empty Capsule shells, calculate the net weight of the Capsule contents, and transfer a portion of the Capsule contents, equivalent to 5 Capsules, to a 100-mL volumetric flask.] Add 15 mL of water, 10 mL of 6 N hydrochloric acid, and 1 mL of *Polysorbate 80 solution* to the flask. Heat on a hot plate or steam bath, with intermittent swirling, until the Capsules are com-

pletely disintegrated or the contents are dissolved. Boil gently for an additional 15 min. Cool, dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution with 0.125 N hydrochloric acid to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Calcium emission line at 422.7 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• CHROMIUM, Method 1

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h, in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of chromium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Chromium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Chromium emission line at 357.9 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of chromium in the *Sample solution* (µg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• COPPER, Method 1

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% (v/v) solution of nitric acid, and dilute with a 1% (v/v) solution of nitric acid to 1000 mL. This solution contains 1000 µg/mL of copper.

Standard stock solution: 100 µg/mL of copper from *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 µg/mL of copper.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 µg/mL of copper and to omit the use of the *Lanthanum chloride solution*

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Copper hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Copper emission line at 324.7 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (Cu) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* (µg/mL)

C_U = nominal concentration of copper in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• FLUORIDE, Method 1

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water contained in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 µg/mL of fluoride from a quantity of sodium fluoride, previously dried at 100° for 4 h and cooled in a desiccator, in water

Intermediate stock solution A: 100 µg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 µg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M sodium acetate solution, and 25.0 mL of Sodium citrate solution. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 µg/mL of fluoride.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the mixed Capsule contents, equivalent to 200 µg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M sodium acetate solution, and 25.0 mL of Sodium citrate solution. Dilute with water to volume.

Analysis

Samples: *Standard solutions* and *Sample solution*
To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see pH <791>), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel-reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of fluoride concentrations, in µg/mL, of the *Standard solutions* versus the potential, in mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, C, in µg/mL, of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• FLUORIDE, Method 2

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 µg/mL of USP Sodium Fluoride RS in water. This solution contains 100 µg/mL of fluoride.

Standard solution

[NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of pH 10.0 buffer. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.]

Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and

adjust with 0.1 N sodium hydroxide to a pH of 10.4 ± 0.1. Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask. Add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with pH 10.0 buffer to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonylpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL container. If necessary, remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 1 mg of fluorine, to a 100-mL volumetric flask. Add 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1, and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Conductivity

Guard column: 4.6-mm × 3-cm; packing L17

Analytical column: 7.8-mm × 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• IODIDE, Method 1

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the contents, equivalent to 3 mg of iodine, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the

crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.] Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared. Calculate the percentage of the labeled amount of iodine (I) in the portion of Capsules taken:

$$\text{Result} = V \times N_A \times F \times \text{Ime} \times (\text{Aw}/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)
 N_A = actual normality of the sodium thiosulfate solution used (meq/mL)
 F = correction factor to convert mg to μg , 1000 $\mu\text{g}/\text{mg}$
 Ime = milliequivalent of I, 21.16 mg/meq
 Aw = average weight of the Capsules content
 W = weight of the sample of Capsules content taken
 L = labeled amount of iodine ($\mu\text{g}/\text{Capsule}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IODIDE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Iodide.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 $\mu\text{g}/\text{mL}$ of iron.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 5 $\mu\text{g}/\text{mL}$ of iron and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Iron emission line at 248.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g}/\text{mL}$, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in $\mu\text{g}/\text{mL}$, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* ($\mu\text{g}/\text{mL}$)

C_U = nominal concentration of iron in the *Sample solution* ($\mu\text{g}/\text{mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

- **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed in the assay for *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g}/\text{mL}$ of magnesium.

Standard stock solution: 20 $\mu\text{g}/\text{mL}$ of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution* and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 $\mu\text{g}/\text{mL}$ of magnesium.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 0.4 $\mu\text{g}/\text{mL}$ of magnesium.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Magnesium emission line at 285.2 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g}/\text{mL}$, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in $\mu\text{g}/\text{mL}$, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* ($\mu\text{g}/\text{mL}$)

C_U = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g}/\text{mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

- **MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese, weighed, to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g}/\text{mL}$ of manganese.

Standard stock solution: 50 $\mu\text{g}/\text{mL}$ of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 $\mu\text{g}/\text{mL}$ of manganese.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of manganese and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Manganese hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Manganese emission line at 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* (µg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• **MOLYBDENUM, Method 1**

Diluent: 20 mg/mL of ammonium chloride in water

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of molybdenum.

Standard stock solution: 100 µg/mL of molybdenum from *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min. Cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 µg/mL of molybdenum.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to take a number of Capsules or a portion of Capsule contents, equivalent to 1000 µg of molybdenum, and to make appropriate dilutions to obtain a final concentration of 10 µg/mL of molybdenum, omitting the addition of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide-acetylene

Analytical wavelength: Molybdenum emission line at 313.3 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of molybdenum, and draw the straight line best fitting the three plotted

points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* (µg/mL)

C_U = nominal concentration of molybdenum in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• **MOLYBDENUM, Method 2**

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: Transfer 40 g of stannous chloride to a beaker, add 20 mL of 6.5 N hydrochloric acid, and heat the solution until the stannous chloride is dissolved. Cool, and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *Stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 µg/mL of molybdenum from ammonium molybdate, in water

Sample: Remove the contents of a counted number of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Use a quantity of Capsule contents, equivalent to a nominal amount of 40 µg of molybdenum

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 465 nm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to each beaker to complete 50 mL in each beaker. Gently boil the water solutions for a few min. Cool to room temperature. Add 2 drops of methyl orange TS and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic

layers from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the solution from the *Sample*
 A_S = absorbance of the solution from the *Standard solution*
 V = volume of the *Standard solution* analyzed, 2.0 mL
 C_S = concentration of molybdenum in the *Standard solution* (μg/mL)
 M_U = nominal concentration of molybdenum in the *Sample* (μg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• PHOSPHORUS, Method 1

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5:100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 μg/mL of phosphorus.

Standard solution: 20 μg/mL of phosphorus from *Phosphorus standard stock solution* diluted with water

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 650 nm

Analysis

Samples: *Standard solution* and *Sample solution*
 To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions, against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of phosphorus in the *Standard solution* (μg/mL)
 C_U = nominal concentration of phosphorus in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 μg/mL of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 μg/mL of potassium from *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 μg/mL of potassium.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium*, Method 1

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium*, Method 1, except to prepare the *Sample solution* to contain 1 μg/mL of potassium and to omit the use of the *Lanthanum chloride solution*

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Potassium emission line at 766.5 nm

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in μg/mL, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in μg/mL, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* (μg/mL)

C_U = nominal concentration of potassium in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed in the assay for *Molybdenum*, Method 1.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness. Add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume, to obtain a concentration of 1000 μg/mL of selenium.

Standard stock solution: 100 μg/mL of selenium from *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to

room temperature, and dilute each with *Diluent* to volume to obtain solutions containing 5.0, 10.0, and 25.0 µg/mL of selenium.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule content, equivalent to 1000 µg of selenium, to 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the sample specimen. Sonicate for 10 min or until the sample specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Selenium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Selenium emission line at 196.0 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* (µg/mL)

C_U = nominal concentration of selenium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% Ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, add hydroxylamine hydrochloride, then dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 µg/mL of selenium. Dilute

a volume of the solution with 0.125 N hydrochloric acid, to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10.0 mL of *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule content, equivalent to a nominal amount of 20 µg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid. [CAUTION—Exercise care at this stage because perchloric acid reaction becomes vigorous.] Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid, and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask. Add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Cell: 1 cm

Analytical wavelength: 380 nm

Blank: 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution* diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*

Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1. Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*. Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbances of the cyclohexane layer from the *Sample solution*

A_S = absorbances of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide dissolved in 5 M hydrochloric acid (3.89 mg/mL),

and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 2 µg/mL of zinc and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Zinc hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Zinc emission line at 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_u = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

- **BORON, NICKEL, TIN, and VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC, Method 2; MOLYBDENUM and SELENIUM, Method 3**

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% (v/v) nitric acid solution and 1000 mg/L of scandium in 5% (v/v) nitric acid solution with *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% (v/v) nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% (v/v) nitric acid solution to obtain a solution with final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/L of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% (v/v) hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% (v/v) hydrochloric acid solution to obtain a solution with final concentrations of about 200 mg/L of boron, and 100 mg/L of chromium, molybdenum, nickel, selenium, tin, and vanadium each.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent*, to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution: Weigh, then transfer 5 Capsules to a 250-mL volumetric flask, and heat gently on a hot plate until the contents begin to release. Cautiously add 25 mL of *Stock aqua regia solution* in 5-mL increments, and swirl. Heat, continue to swirl until the Capsules dissolve into the acid, immediately remove from the heat source, and add 150 mL of water. Cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5-µm pore size nylon syringe filter. If necessary, make any further adjustments using the *Diluent*.

Spectrometric conditions

(See *Plasma Spectrochemistry* (730).)

Mode: Inductively coupled plasma spectrometry using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed for *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*.

Calculate the percentage of the labeled amount for each mineral taken:

$$\text{Result} = C \times (V/W) \times F \times (T_w/L) \times 100$$

C = measured concentration of the relevant element in the *Sample solution* (mg/L)

V = volume of the *Sample solution* (L)

W = sample weight (mg)

F = dilution factor of the *Sample solution*

T_w = average Capsule weight (mg)

L = labeled amount of the relevant element per Capsule (mg/Capsule)

Acceptance criteria: 90%–125% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); 90%–160% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states that the product is Minerals Capsules. The label also states the salt form of the mineral used as the source of each element. Where more than one assay method is given for a particular mineral, the labeling states the assay method used only if *Method 1* is not used.
- **USP REFERENCE STANDARDS** <11>
USP Sodium Fluoride RS

Minerals Tablets

DEFINITION

Minerals Tablets contain two or more minerals derived from substances generally recognized as safe, furnishing two or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc. Tablets contain NLT 90.0% and NMT 125.0% of the labeled amounts of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V). They contain no vitamins. They may contain other labeled added substances in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used. Commercially available atomic absorption standard solutions for the minerals, where applicable, may be used where preparation of a standard stock solution is described in the following assays. Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

- **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h. Dissolve in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively with 0.125 N hydrochloric acid, to obtain a nominal concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution*/100 mL of the final volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Calcium emission line at 422.7 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution*/100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

- **CHROMIUM, Method 1**

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h, in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of chromium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry
Lamp: Chromium hollow-cathode
Flame: Air-acetylene
Analytical wavelength: Chromium emission line at 357.9 nm
Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of chromium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of chromium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% (v/v) solution of nitric acid, and dilute with a 1% (v/v) solution of nitric acid to 1000 mL. This solution contains 1000 $\mu\text{g/mL}$ of copper.

Standard stock solution: 100 $\mu\text{g/mL}$ of copper from the *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 $\mu\text{g/mL}$ of copper.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 $\mu\text{g/mL}$ of copper and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Copper hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Copper emission line at 324.7 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (Cu) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of copper in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• **FLUORIDE, Method 1**

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water contained in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 $\mu\text{g/mL}$ of fluoride from a quantity of sodium fluoride, previously dried at 100° for 4 h and cooled in a desiccator, in water

Intermediate stock solution A: 100 $\mu\text{g/mL}$ of fluoride from *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 $\mu\text{g/mL}$ of fluoride from *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 $\mu\text{g/mL}$ of fluoride.

Sample solution: Transfer a quantity of the finely powdered Tablets, equivalent to a nominal amount of 200 μg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*, and dilute with water to 100 mL.

Analysis

Samples: *Standard solutions* and *Sample solution*
 To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see pH (791)), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ± 0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of fluoride concentrations, in $\mu\text{g/mL}$, of the *Standard solutions* versus the potential, in mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, C , in $\mu\text{g/mL}$, of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (F) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluorine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **FLUORIDE, Method 2**

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 µg/mL of USP Sodium Fluoride RS in water. This solution contains 100 µg/mL of fluoride.

Standard solution

[NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of *pH 10.0 buffer*. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.]

Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ± 0.1 . Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask. Add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with *pH 10.0 buffer* to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of powdered Tablets, equivalent to a nominal amount of 1 mg of fluorine, to 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1 , and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Conductivity

Guard column: 4.6-mm × 3-cm; packing L17

Analytical column: 7.8-mm × 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **IODIDE, Method 1**

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis

Sample: Tablets

Transfer a portion of finely powdered Tablets, equivalent to a nominal amount of 3 mg of iodide, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL

of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.] Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared.

Calculate the percentage of the labeled amount of iodine (I) in the portion of Tablets taken:

$$\text{Result} = V \times N_A \times F \times \text{Ime} \times (Aw/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used (meq/mL)

F = correction factor to convert mg to µg, 1000 µg/mg

Ime = milliequivalent of I, 21.16 mg/meq

Aw = average weight of the Tablets

W = weight of the portion of Tablets taken

L = labeled amount of iodine (µg/Tablet)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IODIDE, Method 2**

Analysis: Proceed as directed in *Automated Methods of Analysis* <16>, *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 µg/mL of iron.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 5 µg/mL of iron and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Lamp: Iron hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Iron emission line at 248.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* (μg/mL)

C_U = nominal concentration of iron in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed in the assay for *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 μg/mL of magnesium.

Standard stock solution: 20 μg/mL of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 μg/mL of magnesium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 0.4 μg/mL of magnesium.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Magnesium emission line at 285.2 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in μg/mL, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in μg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* (μg/mL)

C_U = nominal concentration of magnesium in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• **MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese, weighed, to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 μg/mL of manganese.

Standard stock solution: 50 μg/mL of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain

solutions with concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 μg/mL of manganese.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 μg/mL of manganese and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Manganese emission line at 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in μg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in μg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* (μg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• **MOLYBDENUM, Method 1**

Diluent: 20 mg/mL of ammonium chloride in water

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 μg/mL of molybdenum.

Standard stock solution: 100 μg/mL of molybdenum from *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min. Cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 μg/mL of molybdenum.

Sample solution: Transfer a portion of the powder, equivalent to a nominal amount of 1000 μg of molybdenum, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min, or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid, heat until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Quantitatively transfer the contents of the flask to a 100-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Molybdenum emission line at 313.3 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of molybdenum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• MOLYBDENUM, Method 2

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: Transfer 40 g of stannous chloride to a beaker, add 20 mL of 6.5 N hydrochloric acid, and heat the solution until the stannous chloride is dissolved. Cool, and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *Stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 $\mu\text{g/mL}$ of molybdenum from ammonium molybdate, in water

Sample: A portion of finely powdered powder Tablets, equivalent to a nominal amount of 40 μg of molybdenum

Spectrometric conditions

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 465 nm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature. Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride*

solution to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layers from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the solution from the Tablets

A_S = absorbance of the solution from the *Standard solution*

V = volume of the *Standard solution* analyzed, 2.0 mL

C_S = concentration of molybdenum in the *Standard solution* ($\mu\text{g/mL}$)

M_U = nominal amount of molybdenum in the *Sample solution* (μg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• PHOSPHORUS, Method 1

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5:100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 100 $\mu\text{g/mL}$ of phosphorus.

Standard solution: 20 $\mu\text{g/mL}$ of phosphorus from *Phosphorus standard stock solution* diluted with water

Sample solution: [NOTE—Finely powder and weigh a counted number of Tablets.] Transfer a portion of the powder, equivalent to a nominal amount of 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Spectrometric conditions

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 650 nm

Analysis

Samples: *Standard solution* and *Sample solution*

To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of phosphorus in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of phosphorus in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 $\mu\text{g/mL}$ of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 $\mu\text{g/mL}$ of potassium from *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 $\mu\text{g/mL}$ of potassium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 1 $\mu\text{g/mL}$ of potassium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Potassium emission line at 766.5 nm

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed in the assay for *Molybdenum, Method 1*.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness. Add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume, to obtain a concentration of 1000 $\mu\text{g/mL}$ of selenium.

Standard stock solution: 100 $\mu\text{g/mL}$ of selenium from *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to

volume to obtain solutions with concentrations of 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of selenium.

Sample solution: Transfer a portion of the powder, equivalent to a nominal amount of 1000 μg of selenium, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the sample specimen. Sonicate for 10 min or until the sample specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Selenium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Selenium emission line at 196.0 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of selenium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% Ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, add hydroxylamine hydrochloride, and then dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of selenium. Dilute a volume of the solution with 0.125 N hydrochloric

acid to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10.0 mL of *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to a nominal amount of 20 µg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid. **[CAUTION—Exercise care at this stage because the perchloric acid reaction becomes vigorous.]** Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid, and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask, add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Cell: 1 cm

Analytical wavelength: 380 nm

Blank: 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution* diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*
Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1 . Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*. Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the cyclohexane layer from the *Sample solution*

A_S = absorbance of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide dissolved in 5 M hydrochloric acid (3.89 mg/mL), and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 2 µg/mL of zinc and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Zinc emission line at 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

• BORON, NICKEL, TIN, and VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC, Method 2; MOLYBDENUM and SELENIUM, Method 3

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% (v/v) nitric acid solution and 1000 mg/L of scandium in 5% (v/v) nitric acid solution with *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% (v/v) nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% (v/v) nitric acid solution to obtain a solution with final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/mL of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% (v/v) hydrochloric acid solution, pipet the

appropriate amount of element standard solution into a volumetric flask, and dilute with 20% (v/v) hydrochloric acid solution to obtain a solution with final concentrations of about 200 mg/L of boron, and 100 mg/L of chromium, molybdenum, nickel, selenium, tin, and vanadium each.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent* to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution 1 (for Tablets containing minerals found in *Standard stock solution 1* and *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Sample solution 2 (for Tablets containing minerals found only in *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Sample solution 3 (for Tablets containing minerals found only in *Standard stock solution 1*): Weigh and finely powder NLT 20 Tablets. Transfer a weighed portion, equal to the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently (about 1 h) until fumes cease. Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Spectrometric conditions
(See *Spectrochemistry* <730>.)

Mode: Inductively coupled plasma spectrometry using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed for Analysis.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an

inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*.

Calculate the percentage of the labeled amount for each mineral taken:

$$\text{Result} = C \times (V/W) \times F \times (T_w/L) \times 100$$

C = measured concentration of the relevant element in the *Sample solution* (mg/L)
V = volume of the *Sample solution* (L)
W = sample weight (mg)
F = dilution factor of the *Sample solution*
T_w = average Tablet weight (mg)
L = labeled amount of the relevant element/Tablet (mg)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS <2040>:** Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:** Meet the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS <2021>:** The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS <2022>:** Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states that the product is Minerals Tablets. The label also states the salt form of the mineral used as the source of each element. Where more than one assay method is given for a particular mineral, the labeling states the assay method used only if *Method 1* is not used.

Omega-3 Acid Triglycerides

DEFINITION

Omega-3 Acid Triglycerides is a mixture of mono-, di-, and triesters of omega-3 acids with glycerol containing mainly triesters and obtained either by esterification of concentrated and purified omega-3 acids with glycerol or by transesterification of the omega-3 acid ethyl esters with glycerol. The omega-3 acids are from the body oil of fish of the families Engraulidae, Carangidae, Clupeidae, Osmeridae, Salmonidae, and Scombridae and are defined as the following: alpha-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), eicosapentaenoic acid (EPA) (C20:5 n-3), heneicosapentaenoic acid (C21:5 n-3), docosapentaenoic acid (C22:5 n-3), and docosahexaenoic acid (DHA) (C22:6 n-3). It contains NLT 58.0% of total omega-3 acids expressed as triglycerides and NLT the labeled amount of EPA and DHA, expressed as the free fatty acids. Suitable antioxidants in appropriate concentrations may be added.

IDENTIFICATION

- A.** The retention times of the peaks for eicosapentaenoic acid methyl ester and docosahexaenoic acid methyl ester of the *Sample solution* in the tests for *Content of EPA and DHA* and *Content of Total Omega-3 Acids* correspond to those for the respective compounds of the *Standard solutions*. If either EPA or DHA is not claimed on the labeling, the peak corresponding to that omega-3 acid does not exceed 15.0% of the total detected area of the *Sample solution* in the test for *Content of EPA and DHA* and *Content of Total Omega-3 Acids*.
- B.** The retention time of the peak corresponding to the triglycerides of the *Sample solution* corresponds to the triglycerides peak of the *System suitability solution* in the test for *Content of Oligomers and Partial Glycerides*.

COMPOSITION

• CONTENT OF EPA AND DHA

Analysis: Proceed as directed in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.

Acceptance criteria: NLT the labeled amount, expressed as free acids

• CONTENT OF TOTAL OMEGA-3 ACIDS

Analysis: Proceed as directed in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.

Acceptance criteria: NLT 58.0% of total omega-3 acids, expressed as triglycerides

• CONTENT OF OLIGOMERS AND PARTIAL GLYCERIDES

Mobile phase: Use tetrahydrofuran.

Sample solution: 1.00 mg/mL of Omega-3 Acid Triglycerides in *Mobile phase*

System suitability solution: 0.5 mg/mL of monodocosahexaenoin, 0.3 mg/mL of didocosahexaenoin, and 0.2 mg/mL of tridocosahexaenoin in *Mobile phase*. [NOTE—Suitable grades of monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin may be obtained from Nu-Chek Prep.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Differential refractometer

Columns: Three 7.8-mm × 30-cm; connected in series; packing L21, 7 μm. Two columns are 50 nm in pore size, and the other is 10 nm, arranged so that the 50-nm pore size columns are closer to the injector.

Flow rate: 0.8 mL/min

Injection size: 40 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Elution order: Tridocosahexaenoin, didocosahexaenoin, and monodocosahexaenoin

Resolution: NLT 2.0 between monodocosahexaenoin and didocosahexaenoin and NLT 1.0 between didocosahexaenoin and tridocosahexaenoin

Analysis

Sample: *Sample solution*

Measure the areas of the major peaks.

Calculate the percentage of oligomers in the portion of Omega-3 Acid Triglycerides taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = sum of the areas of the peaks with a retention time less than that of the triglyceride peak

r_T = sum of the areas of all peaks in the chromatogram

Calculate the percentage of partial glycerides (mono- and diglycerides) in the portion of Omega-3 Acid Triglycerides taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = sum of the areas of the peaks corresponding to diglycerides and monoglycerides

r_T = sum of the areas of all peaks in the chromatogram

Acceptance criteria: NMT 3.0% of oligomers and NMT 50.0% of partial glycerides

CONTAMINANTS

• LIMIT OF ARSENIC

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature,

transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 μ L provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in *Arsenic* <211>, to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. **[CAUTION—Wear proper eye protection and protective clothing and gloves.]** Transfer approximately 500 mg of Omega-3 Acid Triglycerides, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. **[NOTE—A cool water bath may be used to speed the cooling process.]** Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold.

Separately inject equal volumes (20 μ L) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 μ L of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in μ g/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in μ g/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Omega-3 Acid Triglycerides taken:

$$\text{Result} = (C \times V)/W$$

C = concentration of arsenic, as obtained above, in the *Sample solution* (μ g/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Omega-3 Acid Triglycerides taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 μ g/g

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.**]**

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 μ L provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* <231>, to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold.

Separately inject equal volumes (20 μ L) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 μ L of the *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in μ g/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in μ g/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Omega-3 Acid Triglycerides taken:

$$\text{Result} = (C \times V)/W$$

C = concentration of lead, as obtained above, in the *Sample solution* (μ g/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Omega-3 Acid Triglycerides taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF CADMIUM**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before make up to final volume, dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold.

Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of the *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of cadmium in the Omega-3 Acid Triglycerides taken:

$$\text{Result} = (C \times V)/W$$

- C* = concentration of cadmium, as obtained above, in the *Sample solution* (µg/mL)
V = final volume of the *Sample solution* (mL)
W = weight of Omega-3 Acid Triglycerides taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF MERCURY:** Proceed as directed in *Mercury* (261), *Method IIa*, except use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*, combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution*.

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF DIOXINS, FURANS, AND POLYCHLORINATED BIPHENYLS (PCBs)**

Analysis: Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 2.0 pg/g of WHO toxic equivalents. The sum of PCDDs, PCDFs, and dioxin-like PCBs (polychlorinated biphenyls, non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169, and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is NMT 10.0 pg/g of WHO toxic equivalents.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value (401):** NMT 3
- **FATS AND FIXED OILS, Anisidine Value (401):** NMT 30.0
- **FATS AND FIXED OILS, Peroxide Value (401):** NMT 10.0
- **FATS AND FIXED OILS, Unsaponifiable Matter (401):** NMT 2.0%
- **ABSORBANCE**
Sample solution: 0.24 mg/mL in isooctane
Acceptance criteria: The absorbance is NMT 0.73, determined at 233 nm.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature. It may be bottled or otherwise packaged in containers from which air has been expelled by production of a vacuum or by an inert gas.
- **LABELING:** The label states the average content of DHA and EPA as free acids, in mg/g, and the total content of omega-3 acids as free acids, in mg/g. It also states the name and concentration of any added antioxidant.

Phenylalanine—see *Phenylalanine General Monographs*

Phyllanthus amarus

DEFINITION

Phyllanthus amarus consists of the dried aerial parts of *Phyllanthus amarus* Schumach. (Fam. Euphorbiaceae). It contains NLT 0.25% of lignans, calculated as the sum of phyllanthin and hypophyllanthin on the dried basis.

IDENTIFICATION

- **A.** *Phyllanthus amarus* meets the requirements in *Specific Tests for Botanic Characteristics*.

- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Standard solution A: 0.1 mg/mL of USP Phyllanthin RS in methanol

Standard solution B: 10 mg/mL of USP Powdered *Phyllanthus amarus* Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Sonicate about 0.5 g of *Phyllanthus amarus*, finely powdered, in 5 mL of methanol for 10 min, centrifuge, and use the supernatant.

Adsorbent: Chromatographic silica gel with an average particle size of 10–15 µm (TLC plates) or with an average particle size of 5 µm (HPTLC plates)

Application volume: 10 µL (TLC plates) or 4 µL (HPTLC plates)

Developing solvent system: Hexane and ethyl acetate (2:1)

Spray reagent: A solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, heat for 3 min at 120°, and examine under visible light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a blue band in the lower third of the plate due to phyllanthin, corresponding in color and R_f to that in the chromatogram of *Standard solution A*; a violet band due to hypophyllanthin at an R_f higher than that of phyllanthin; a blue band at an R_f higher than that of hypophyllanthin; and an additional violet band in the upper third of the plate. Bands detected in the chromatogram of the *Sample solution* correspond in position and color to bands in the chromatogram of *Standard solution B*. Other minor bands may be observed in the chromatograms of the *Sample solution* and *Standard solution B*.

- **C. HPLC:** The chromatogram of the *Sample solution* obtained in the test for *Content of Lignans* shows a peak at a retention time corresponding to that of phyllanthin in the chromatogram of *Standard solution A*. Identify other lignan peaks in the chromatogram of the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered *Phyllanthus amarus* Extract RS being used. The chromatogram of the *Sample solution* shows an additional peak corresponding to hypophyllanthin.

COMPOSITION

• **CONTENT OF LIGNANS**

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, mix, filter, and degas.

Mobile phase: Acetonitrile and *Solution A* (4:6)

Standard solution A: 0.1 mg/mL of USP Phyllanthin RS in methanol

Standard solution B: Sonicate a portion of USP Powdered *Phyllanthus amarus* Extract RS in methanol to obtain a solution having a concentration of about 5.0 mg/mL. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Transfer about 3.0 g of *Phyllanthus amarus*, finely powdered and accurately weighed, to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux in a water bath for about 20 min, allow to settle, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, concentrate under vacuum, and adjust the volume to 100 mL with methanol. Before injection, pass through a membrane filter of 0.45-µm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered *Phyllanthus amarus* Extract RS being used.

Resolution: NLT 1.5 between the phyllanthin and hypophyllanthin peaks, *Standard solution B*

Tailing factor: NMT 1.5 for the phyllanthin peak, *Standard solution A*

Relative standard deviation: NMT 2.0% determined from the phyllanthin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*. [NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 48 h at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered *Phyllanthus amarus* Extract RS being used, identify the retention times of the peaks corresponding to phyllanthin and hypophyllanthin.

Separately calculate the percentages of phyllanthin and hypophyllanthin in the portion of *Phyllanthus amarus* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak response of the analyte from the *Sample solution*

r_S = peak response of phyllanthin from *Standard solution A*

C_S = concentration of USP Phyllanthin RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of *Phyllanthus amarus* taken to prepare the *Sample solution* (mg)

F = conversion factors for the analytes: 1.00 for phyllanthin; 0.75 for hypophyllanthin

Acceptance criteria: Add the percentages of phyllanthin and hypophyllanthin: NLT 0.25% is found on the dried basis.

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN,** *General Method for Pesticide Residues Analysis* (561): Meets the requirements

- **HEAVY METALS, Method III (231):** NMT 20 ppm
- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: Erect annual herb, 10–60-cm high; slender stem, leaves on main stem are reduced to scales; secondary branchlets, short, extend at right angles, each carrying 15–30 leaves; leaves have a green upper surface with raised midrib and a pale green lower surface with prominent midrib and secondary veins, simple, alternate, 3–11 mm long, 1.5–6 mm wide, short petiolate, elliptical-oblong to obovate, apex obtuse and often with small pointed tip, margin entire, base often slightly asymmetric; flowers minute, yellowish, greenish, or whitish, unisexual, axillary on secondary branchlets, 1–2 and sometimes 3 per axil, first 1–2 internodes of each branchlet bear 1–2 male flowers, the rest have male and female flowers; fruits are flattened spherical capsules, straw color, 3-loculed, about 2 mm in diameter; seeds usually 2 per locule, light brown, about 0.9-mm long, triangular with 6–7 longitudinal ribs and many transverse striations on the back. Pharmacopeial article is green to yellowish-green masses composed mostly of leaves, branchlets, and stem fragments; taste bitter.

Histology

Transverse section of stems: Epidermal layer; about 15 layers of cortex cells, thick wall, contain chloroplast, some contain calcium oxalate crystals, inner 7–10 layers are made of thick-wall cells interrupted at regular interval by parenchyma cells; a layer of parenchyma cells containing starch grains; phloem 7–10 layers of thin-wall cells; groups of xylem vessels; pith, multilayer of thin-wall cells, few contain calcium oxalate crystals.

Transverse section of branchlets: The transverse section is round; 6–8 layers of cortex, thick-wall cells, most contain chloroplast and a few calcium oxalate crystals, after 3–4 layers there is a layer of cells containing starch grains, followed by 2–3 layers of fiber cells interrupted by cortex parenchyma; phloem 5–7 layers of thin-wall cells; groups of xylem vessels; pith, multilayer of thin-wall cells, containing chloroplasts.

Transverse section of leaves: Upper and lower epidermis; a single layer of palisade cells, which occupy nearly half of the space between each epidermis; 3–5 layers of parenchyma cells, a few contain crystals of calcium oxalate; vascular bundles are also present.

- **LOSS ON DRYING (731):** Dry 1.0 g of finely powdered *Phyllanthus amarus* at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 8.0%, determined on 1.0 g of finely powdered *Phyllanthus amarus*
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 5.0%, determined on 1.0 g of finely powdered *Phyllanthus amarus*
- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.

- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS (11)**
USP Phyllanthin RS
USP Powdered *Phyllanthus amarus* Extract RS

Powdered *Phyllanthus amarus*

DEFINITION

Powdered *Phyllanthus amarus* is *Phyllanthus amarus* reduced to a powder or very fine powder. It contains NLT 0.25% of lignans, calculated as the sum of phyllanthin and hypophyllanthin, on the dried basis.

IDENTIFICATION

- **A. Powdered *Phyllanthus amarus*** meets the requirements in *Specific Tests for Botanic Characteristics*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
Standard solution A: 0.1 mg/mL of USP Phyllanthin RS in methanol
Standard solution B: 10 mg/mL of USP Powdered *Phyllanthus amarus* Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.
Sample solution: Sonicate about 0.5 g of Powdered *Phyllanthus amarus* in 5 mL of methanol for 10 min, centrifuge, and use the supernatant.
Adsorbent: Chromatographic silica gel with an average particle size of 10–15 μm (TLC plates) or with an average particle size of 5 μm (HPTLC plates)
Application volume: 10 μL (TLC plates) or 4 μL (HPTLC plates)
Developing solvent system: Hexane and ethyl acetate (2:1)
Spray reagent: A solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the plate. Remove the plate from the chamber, dry, spray with the *Spray reagent*, heat for 3 min at 120°, and examine under visible light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a blue band in the lower third of the plate due to phyllanthin, corresponding in color and R_f to that in the chromatogram of *Standard solution A*; a violet band due to hypophyllanthin at an R_f higher than that of phyllanthin; a blue band at an R_f higher than that of hypophyllanthin; and an additional violet band in the upper third of the plate. Bands detected in the chromatogram of the *Sample solution* correspond in position and color to bands in the chromatogram of *Standard solution B*. Other minor bands may be observed in the chromatograms of the *Sample solution* and *Standard solution B*.

- **C. HPLC:** The chromatogram of the *Sample solution* obtained in the test for *Content of Lignans* shows a peak at a retention time corresponding to that of phyllanthin in the chromatogram of *Standard solution A*. Identify other lignan peaks in the chromatogram of the *Sample solution* by comparison with the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered *Phyllanthus amarus* Extract RS being used. The chromatogram of the *Sample solution* shows an additional peak corresponding to hypophyllanthin.

COMPOSITION**• CONTENT OF LIGNANS**

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, mix, filter, and degas.

Mobile phase: Acetonitrile and *Solution A* (4:6)

Standard solution A: 0.1 mg/mL of USP Phyllanthin RS in methanol

Standard solution B: Sonicate a portion of USP Powdered *Phyllanthus amarus* Extract RS in methanol to obtain a solution having a concentration of about 5.0 mg/mL. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Sample solution: Transfer about 3.0 g of Powdered *Phyllanthus amarus*, accurately weighed, to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux in a water bath for about 20 min, leave to settle, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, concentrate under vacuum, and adjust the volume with methanol to 100 mL. Before injection, pass through a membrane filter of 0.45-μm or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered *Phyllanthus amarus* Extract RS being used.

Resolution: NLT 1.5 between the phyllanthin and hypophyllanthin peaks, *Standard solution B*

Tailing factor: NMT 1.5 for the phyllanthin peak, *Standard solution A*

Relative standard deviation: NMT 2.0% determined from the phyllanthin peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*. [NOTE—*Standard solution A*, *Standard solution B*, and the *Sample solution* are stable for 48 h at room temperature.]

Using the chromatograms of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP Powdered *Phyllanthus amarus* Extract RS being used, identify the retention times of the peaks corresponding to phyllanthin and hypophyllanthin.

Separately calculate the percentages of phyllanthin and hypophyllanthin in the portion of Powdered *Phyllanthus amarus* taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak response of the analyte from the *Sample solution*

r_S = peak response of phyllanthin from *Standard solution A*

C_S = concentration of USP Phyllanthin RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered *Phyllanthus amarus* taken to prepare the *Sample solution* (mg)

F = conversion factors for the analytes: 1.00 for phyllanthin; 0.75 for hypophyllanthin

Acceptance criteria: Add the percentages of phyllanthin and hypophyllanthin: NLT 0.25% is found on the dried basis.

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **HEAVY METALS**, *Method III* (231): NMT 20 ppm
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS** Greenish to greenish-brown in color; taste bitter. Under a microscope, fragments of epidermal cells of the leaves with wavy walls, showing anisocytic and paracytic stomata; parenchyma cells, some showing clusters of calcium oxalate crystals; narrow fibers from the stem; pitted vessels of the stem; fragments of the epicarp of the fruits showing anomocytic stomata
- **LOSS ON DRYING** (731): Dry 1.0 g of Powdered *Phyllanthus amarus* at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 8.0%, determined on 1.0 g of Powdered *Phyllanthus amarus*
- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* (561): NMT 5.0%, determined on 1.0 g of Powdered *Phyllanthus amarus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS** (11)
USP Phyllanthin RS
USP Powdered *Phyllanthus amarus* Extract RS

Phytonadione—see *Phytonadione General Monographs*

Phytonadione Tablets—see *Phytonadione Tablets General Monographs*

Potassium Citrate—see *Potassium Citrate General Monographs*

Potassium Citrate Tablets**DEFINITION**

Potassium Citrate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of potassium (K).

IDENTIFICATION

- **A.** The *Sample solution* for *Strength* produces line emissions or absorptions at the characteristic wavelengths for potassium.

• **B. IDENTIFICATION TESTS—GENERAL, Citrate (191)**

Analysis: Grind a Tablet to a fine powder in a mortar. Transfer the powder to a centrifuge tube, add 2–5 mL of water, sonicate for 1 min, shake, and centrifuge.

Acceptance criteria: The supernatant meets the requirements for the test.

STRENGTH

• **CONTENT OF POTASSIUM, PROCEDURE 1**

[NOTE—A standard stock solution is commercially available at different potassium concentrations, which may be used for preparation of the *Standard stock solution*. Necessary volumetric adjustment can be made in the *Standard solution*. Concentrations of the *Standard solution* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

Standard stock solution: Solution of potassium chloride, previously dried at 105° for 2 h, in water containing 1000 mg/L of potassium.

Standard solution: To a 50-mL volumetric flask add 20 mL of water and 1 mL of nitric acid, and mix thoroughly. Pipet 10.0 mL of the *Standard stock solution* into a volumetric flask, and dilute with water to volume to obtain a solution having a known concentration of about 200 µg/mL of potassium.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed portion of the powdered Tablets, equivalent to about 0.1 g of potassium, to a 50-mL flask. Add 10 mL of nitric acid, and heat the solution to a gentle boil, during which fuming evolves. Boil the solution for an additional 30 min with constant swirling, during which time no fuming should be observed. Cool the solution to room temperature. Quantitatively transfer all of the solution to a 500-mL volumetric flask, dilute with water to volume, mix, and filter.

Inductively coupled plasma system

(See *Plasma Spectrochemistry* (730).)

Mode: Atomic emission spectroscopy

Analytical wavelength: 766.49 nm. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. A typical setting includes radio frequency (RF) power of about 1300 watts, argon torch flow of about 15 L/min, argon auxiliary flow of about 0.2 L/min, and a nebulizer flow rate of about 0.8 L/min.]

Blank: 2% nitric acid solution

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*. Calculate the percentage of the labeled amount of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response from the *Sample solution*

r_S = response from the *Standard solution*

C_S = concentration of potassium in the *Standard solution* (µg/mL)

C_U = nominal concentration of potassium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of potassium

• **CONTENT OF POTASSIUM, PROCEDURE 2**

Standard stock solution A: 100 µg/mL of potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution B: 10 µg/mL of potassium from *Standard stock solution A* in 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of *Standard stock solution B* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of potassium.

Sample solution: Finely powder NLT 20 Tablets.

Transfer an equivalent to 5 Tablets to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively with 0.125 N hydrochloric acid to obtain a nominal concentration of 2 µg/mL of potassium.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*. Determine the absorbances of the solutions, using the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in µg/mL of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of potassium in the *Sample solution* interpolated from the graph (µg/mL)

C_U = nominal concentration of potassium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0% of the label claim

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined yeast and mold count does not exceed 10^2 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meet the requirement of the test for absence of *Escherichia coli*

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION (2040)**

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Analysis: Proceed as directed in *Content of Potassium, Procedure 1* or *Procedure 2*, for *Strength*, making any necessary volumetric adjustments.

Sample solution: If *Content of Potassium, Procedure 1* is used, pipet 10.0 mL of the filtered pooled solution under test to a 50-mL volumetric flask, and dilute with 2% nitric acid solution to 50 mL. If *Content of Potassium, Procedure 2* is used, dilute the filtered pooled solution under test with 0.125 N hydrochloric acid to a concentration falling within the range of the *Standard solutions*.

Calculate the percentage of the labeled amount of potassium (K) dissolved:

$$\text{Result} = (C \times D \times V/L) \times 100$$

C = measured concentration of potassium in the *Sample solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% of the labeled amount of K is dissolved.

- **WEIGHT VARIATION** (2091): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The label states the quantity of potassium in terms of mg/Tablet.

Potassium Gluconate—see *Potassium Gluconate General Monographs*

Potassium Gluconate Oral Solution—see *Potassium Gluconate Oral Solution General Monographs*

Potassium Gluconate Tablets—see *Potassium Gluconate Tablets General Monographs*

Proline—see *Proline General Monographs*

Pygeum

DEFINITION

Pygeum consists of the bark of *Prunus africana* (Hook f.) Kalkman (*Pygeum africanum* Hook f.) (Fam. Rosaceae). It contains NLT 9.0% of extractable matter.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 10 mg/mL of USP Pygeum Extract RS in chloroform

Standard solution B: 1 mg/mL of USP β -Sitosterol RS in chloroform

Sample solution: Transfer 10 g of the powdered plant material to a soxhlet apparatus. Extract with 150 mL of methylene chloride for 4 h. Evaporate the extract under vacuum to dryness. Dissolve the residue with 10 mL of methylene chloride.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 μ L

Developing solvent system: Methylene chloride in a saturated chamber

Spray reagent: Sulfuric acid and water (1:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms to a length of NLT 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat the plate at 100° for 10 min. Examine the plate under white light.

Acceptance criteria: The chromatogram obtained with the *Sample solution* shows one red-violet zone turning to grayish-brown near the origin that corresponds in color and R_f value to that in the chromatogram of *Standard solution A*; one red-violet zone turning to grayish-

brown at an R_f about 0.08, corresponding in color and R_f value to that in the chromatogram of *Standard solution B*; above these spots a grayish-brown zone may be present, corresponding in color and R_f value to that in the chromatogram of *Standard solution A*. Other colored zones of varying intensities may be observed in the chromatogram of the *Sample solution*.

COMPOSITION

• EXTRACTABLE MATTER

Analysis: Extract 2.00 g of the powdered material in a soxhlet apparatus with 150 mL of alcohol for 6 h. Evaporate the solution to dryness under vacuum, and dry the residue at 105° for 24 h.

Acceptance criteria: NLT 9.0% of extractable matter

CONTAMINANTS

- **HEAVY METALS** (231): NMT 20 μ g/g

- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** (561): Meets the requirements

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Bark pieces consist of long fragments of variable dimensions, from only a few cm to 1 m long with a thickness varying from a few mm to 1–2 cm. The color is brown, more or less dark on the external surface; light brown to red-brown on the internal surface. The external part of the bark presents a very dark and fissured rhytidome that in the samples of old trees is fragmented in more or less square plaques of about 1–5 cm. The thickness varies from 1 mm in young plants or branches to 5–8 mm in old plants. The outer surface may also be covered with whitish lichens or thin filamentous moss. The internal bark, under the rhytidome, is clearer and has a more reddish coloration, with a long fibrous break, from reddish to light brown and dark brown in color, often presenting concentric stratification cracks. The internal surface is clearer and presents small wrinkles.

Microscopic: The transverse section of the bark presents a suberized bed having a thickness depending on the age of the plant, consisting of multiple layers of small, square cells with the walls of moderate thickness. It presents a cortical parenchyma of more or less round cells, with a few apparent formations of very thin-walled sclereids, definitely sharp. Often, in the parenchyma, there are groups of cells containing oxalate druses; a few bigger cells with highly thickened walls can also be observed. It shows a liber with phloem zones and presenting medullary rays. The phloemal portions contain groups of fibrous cells with highly thickened walls as well as phloemal and parenchymal elements, sometimes containing druses of oxalate. The medullary rays are of conical shape, larger on the external surface and thinner on the internal side; they can also contain druses of oxalate.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** (561): NMT 5.0%

- **LOSS ON DRYING** (731): Dry at 60° for 15 h: it loses NMT 10.0% of its weight.

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 10.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

- **USP REFERENCE STANDARDS** (11)

USP Pygeum Extract RS

USP β -Sitosterol RS

Pygeum Extract

DEFINITION

Pygeum Extract is prepared from pulverized Pygeum, using suitable solvents. It contains NLT 90% and NMT 110% of the labeled amount of docosyl ferulate and NLT 90% and NMT 110% of the labeled amount of total sterols as β -sitosterol, calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution A: 15 mg/mL of USP Pygeum Extract RS in chloroform

Standard solution B: 2 mg/mL of USP β -Sitosterol RS in chloroform

Sample solution: Dissolve 150 mg of Extract in 10 mL of chloroform.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 μ L

Developing solvent system: Methylene chloride in a saturated chamber

Spray reagent: Sulfuric acid and water (1:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatograms to a length of NLT 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat the plate at 100° for 10 min. Examine the plate under white light.

Acceptance criteria: The chromatogram from the *Sample solution* shows one red-violet zone turning to grayish-brown near the origin that corresponds in color and R_f value to that of *Standard solution A*, and one red-violet zone turning to grayish-brown at an R_f of 0.08 corresponding in color and R_f value to that in the chromatogram of *Standard solution B*; above these spots a grayish-brown zone may be present, corresponding in color and R_f value to that of *Standard solution A*; and other colored zones of varying intensities may be observed in the *Sample solution*.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Docosyl Ferulate*.

Acceptance criteria: The chromatogram of the *Sample solution* presents a peak for docosyl ferulate that corresponds in retention time to the principal peak in the chromatogram of the *Standard solution*.

COMPOSITION

• CONTENT OF STEROLS

Derivatizing solution: Bis(trimethylsilyl)acetamide and trimethylchlorosilane (9:1)

Internal standard solution: 2 mg/mL of 5 α -cholestane in chloroform

System suitability stock solution: 2 mg/mL each of campesterol, stigmasterol, and USP β -Sitosterol RS

System suitability solution: Mix 2.0 mL of the *System suitability stock solution* and 2.0 mL of the *Internal standard solution*, and dilute with chloroform to 10 mL. Evaporate 500 μ L of this solution to dryness using a stream of nitrogen. Dissolve the residue in 80 μ L of *Derivatizing solution* and 20 μ L of pyridine. Allow to stand for NLT 10 min at room temperature.

Standard stock solution: 2.0 mg/mL of USP β -Sitosterol RS in chloroform

Standard solution: Mix 2.0 mL of the *Standard stock solution* and 2.0 mL of the *Internal standard solution*, and dilute with chloroform to 10 mL. Evaporate 500 μ L of this solution to dryness using a stream of nitrogen. Dissolve the residue in 80 μ L of *Derivatizing solution* and

20 μ L of pyridine. Allow to stand for NLT 10 min at room temperature.

Sample solution: Transfer 100 mg of Extract into a 100-mL round-bottom flask. Add 2.0 mL of *Internal standard solution* and 20 mL of diluted hydrochloric acid. Attach a condenser, and reflux in a bath at 100° for 30 min. Cool the solution to room temperature, and adjust by the addition of about 5 mL of 10 N sodium hydroxide to a pH of 8. Extract twice using 50 mL of ether each time, wash the collected organic phases with 50 mL of water, and evaporate the organic phase to dryness under vacuum. Dissolve the residue with 4 mL of chloroform, and transfer to a cartridge containing 500 mg of packing L8¹ that has been conditioned with a 2-column volume of *n*-hexane. Collect the eluate. Elute twice with a 1-column volume of a mixture of chloroform and isopropanol (2:1). Combine the eluates, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform. Evaporate 500 μ L of this solution to dryness under a stream of nitrogen. Dissolve the residue with 80 μ L of *Derivatizing solution* and 20 μ L of pyridine. Allow to stand for NLT 10 min at room temperature.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 30-m capillary; G27 phase coating of 0.25- μ m thickness

Temperature:

Injector: 285°

Detector: 285°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
250	0	250	5
250	5	320	0

Carrier gas: Helium. [NOTE—The carrier gas flow rate should be adjusted to obtain a retention time of about 19 min for β -sitosterol.]

Makeup gas: Helium

Injection size: 2 μ L

Injection type: Split injection system

Split ratio: 1:50

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for 5 α -cholestane, campesterol, stigmasterol, and β -sitosterol are about 0.66, 0.94, 0.96, and 1.00, respectively.]

Suitability requirements

Resolution: NLT 2 between campesterol and stigmasterol

Column efficiency: NLT 150,000 theoretical plates for the 5 α -cholestane peak

Tailing factor: NMT 2.0 for each relevant peak

Analysis

Samples: *Standard solution* and *Sample solution*
Identify the signals corresponding to the relevant analytes by comparison with the chromatograms obtained with the *System suitability solution*.

Separately calculate the individual percentages of campesterol, stigmasterol, and β -sitosterol, as β -sitosterol, respectively, in the portion of Pygeum Extract taken:

$$C_i = (R_i/R_s) \times C_s \times (V/W) \times 100$$

¹ A suitable cartridge is Chromabond NH2, manufactured by Macheray Nagel, or equivalent.

R_U = ratio of the appropriate sterol peak to the internal standard from the *Sample solution*
 R_S = ratio of the β -sitosterol peak to the 5α -cholestane internal standard from the *Standard solution*
 C_S = concentration of β -sitosterol in the *Standard stock solution* (mg/mL)
 V = volume of the *Standard stock solution* taken to prepare the *Standard solution* (mL)
 W = weight of Pygeum Extract taken to prepare the *Sample solution* (mg)
 Calculate the percentage of the labeled amount of total sterols as β -sitosterol:

$$\text{Result} = (\Sigma C_i/L) \times 100$$

C_i = individual percentage of each sterol as calculated above
 L = labeled amount of total sterols in the Pygeum Extract taken

Acceptance criteria: 90%–110% of the labeled amount of total sterols as β -sitosterol on the dried basis

• CONTENT OF DOCOSYL FERULATE

Solution A: Methanol and water (95:5)

Solution B: Acetonitrile

Mobile phase: *Solution A* and *Solution B* (17:3)

Standard solution: Dissolve a quantity of USP Docosyl Ferulate RS in chloroform, and dilute with acetonitrile to obtain a concentration of 0.02 mg/mL. Pass through a filter of 0.45- μ m or finer pore size.

Sample solution: To 250 mg of Extract add 5 mL of chloroform, and dilute with acetonitrile to 25 mL. Pass through a filter of 0.45- μ m or finer pore size, discarding the first 4 mL of filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 323 nm

Column: 4-mm \times 25-cm; packing L7

Column temperature: 25°

Flow rate: 1 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1700 theoretical plates for the docosyl ferulate peak

Tailing factor: NMT 2.0 for docosyl ferulate

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of docosyl ferulate (P) in the portion of Extract taken:

$$P = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area for docosyl ferulate from the *Sample solution*

r_S = peak area for docosyl ferulate from the *Standard solution*

C_S = concentration of USP Docosyl Ferulate RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Extract taken to prepare the *Sample solution* (mg)

Calculate the percentage of the labeled amount of docosyl ferulate:

$$\text{Result} = (P/L) \times 100$$

P = percent of docosyl ferulate in the portion of Extract taken

L = labeled amount of docosyl ferulate in the Pygeum Extract (%)

Acceptance criteria: 90%–110% of the labeled amount of docosyl ferulate on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method II** <231>: 20 μ g/g
- **ARTICLES OF BOTANICAL ORIGIN, Test for Aflatoxins** <561>: NMT 4 μ g/kg of total aflatoxins B1, B2, G1, and G2; NMT 2 μ g/kg of aflatoxin B1
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis** <561>: Meets the requirement
- **BOTANICAL EXTRACTS, Preparations** <565>: Meets the requirements in *General Pharmacopeial Requirements, Residual Solvents*
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry 1.0 g of Extract for 3 h at 110°: it loses NMT 10% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in tight containers, protected from light.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. Label the content as a percentage of total sterols as β -sitosterol and the content as a percentage of docosyl ferulate. It also meets the requirements in *Botanical Extracts* <565>, *Labeling*.
- **USP REFERENCE STANDARDS** <11>
 - USP Docosyl Ferulate RS
 - USP Pygeum Extract RS
 - USP β -Sitosterol RS

Pygeum Capsules

DEFINITION

Pygeum Capsules contain Pygeum Extract. Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of Extract, calculated as sterols and docosyl ferulate.

IDENTIFICATION

- **A.** The retention times of the peaks for campesterol, stigmasterol, and β -sitosterol, of the *Sample solution*, correspond to those of the *Standard solution*, as obtained in the test for *Content of Sterols*.
- **B.** The retention time of the peak for docosyl ferulate in the *Sample solution* corresponds to that in the *Standard solution*, as obtained in the test for *Content of Docosyl Ferulate*.

STRENGTH

• CONTENT OF STEROLS

Derivatizing solution: Bis(trimethylsilyl)acetamide and trimethylchlorosilane (9:1)

Internal standard solution: 2 mg/mL of 5α -cholestane in chloroform

System suitability stock solution: 2 mg/mL each of campesterol, stigmasterol, and USP β -Sitosterol RS

System suitability solution: Mix 2.0 mL of the *System suitability stock solution* and 2.0 mL of the *Internal standard solution*, and dilute with chloroform to 10 mL. Evaporate 500 μ L of this solution to dryness using a stream of nitrogen. Dissolve the residue in 80 μ L of *Derivatizing solution* and 20 μ L of pyridine. Allow to stand for NLT 10 min at room temperature.

Standard stock solution: 2.0 mg/mL of USP β -Sitosterol RS in chloroform

Standard solution: Mix 2.0 mL of the *Standard stock solution* and 2.0 mL of the *Internal standard solution*, and dilute with chloroform to 10 mL. Evaporate 500 μ L of this solution to dryness using a stream of nitrogen. Dissolve the residue in 80 μ L of *Derivatizing solution* and 20 μ L of pyridine. Allow to stand for NLT 10 min at room temperature.

Sample solution: Transfer a quantity of Capsules, equivalent to 100 mg of the labeled amount of Extract, into a 100-mL round-bottomed flask. Add 2.0 mL of the *Internal standard solution* and 20 mL of diluted hydrochloric acid. Attach a condenser, and reflux in a bath at 100° for 30 min. Cool the solution to room temperature, and adjust by the addition of about 5 mL of 10 N sodium hydroxide to a pH of 8. Extract twice using 50 mL of ether each time, wash the collected organic phases with 50 mL of water, and evaporate the organic phase to dryness under vacuum. Dissolve the residue with 4 mL of chloroform, and transfer to a cartridge containing 500 mg of packing L8 that has been conditioned with a 2-column volume of *n*-hexane. [NOTE—A suitable cartridge is Chromabond NH2, manufactured by Macherey Nagel, or equivalent.] Collect the eluate. Elute twice with a 1-column volume of a mixture of chloroform and isopropanol (2:1). Combine the eluates, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform. Evaporate 500 μ L of this solution to dryness under a stream of nitrogen. Dissolve the residue with 80 μ L of *Derivatizing solution* and 20 μ L of pyridine. Allow to stand for NLT 10 min at room temperature.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 30-m capillary column coated with a G27 phase of 0.25- μ m thickness

Temperature

Detector: 285°

Injector: 285°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
250	0	250	5
250	5	320	as needed

Carrier gas: Helium. [NOTE—The carrier gas flow rate should be adjusted to obtain a retention time of 19 min for β -sitosterol.]

Makeup gas: Helium

Injection size: 2 μ L

Injection type: Split injection system

Split ratio: 1:50

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for 5 α -cholestane, campesterol, stigmasterol, and β -sitosterol are about 0.66, 0.94, 0.96, and 1.00, respectively.]

Suitability requirements

Resolution: NLT 2 between campesterol and stigmasterol

Column efficiency: NLT 150,000 theoretical plates for the 5 α -cholestane peak

Tailing factor: NMT 2.0 for each relevant peak

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the signals corresponding to the relevant analytes by comparison with the chromatograms obtained with the *System suitability solution*.

Calculate the percentages of the labeled amount of Extract as sterols in the portion of the Capsules taken:

$$\text{Result} = (\Sigma R_U/R_S) \times (C_S \times V/W) \times (A_W \times 100/L_E) \times 100/L$$

ΣR_U = ratio of the sum of peak responses for campesterol, stigmasterol, and β -sitosterol relative to the internal standard from the *Sample solution*

R_S = ratio of the β -sitosterol peak relative to the internal standard from the *Standard solution*

C_S = concentration of β -sitosterol in the *Standard stock solution* (mg/mL)

V = volume of the *Standard stock solution* used to prepare the *Standard solution* (2.0 mL)

W = weight of the sample of Capsules taken to prepare the *Sample solution* (mg)

A_W = average weight of the Capsules contents (mg)

L_E = content of sterols in 100 mg of the Extract used to prepare the Capsules (mg)

L = labeled amount of Extract per Capsule (mg/Capsule)

Acceptance criteria: 90%–110% of the labeled amount of Extract, calculated as sterols

• CONTENT OF DOCOSYL FERULATE

Solution A: Methanol and water (95:5)

Solution B: Acetonitrile

Mobile phase: *Solution A* and *Solution B* (17:3)

Standard solution: Dissolve a quantity of USP Docosyl Ferulate RS in chloroform, and dilute stepwise if necessary, with acetonitrile to obtain a concentration of 0.01 mg/mL. Pass through a membrane filter of 0.45- μ m or finer pore size.

Sample solution: Weigh the contents of NLT 20 Capsules and transfer a quantity of the material, equivalent to 0.2 mg of docosyl ferulate, to a 50-mL beaker. Add 5 mL of chloroform and dissolve in an ultrasonic bath. Transfer to a 20-mL volumetric flask with the aid of NMT 2 mL of chloroform. Dilute with acetonitrile to volume and mix. Pass through a membrane filter of 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 323 nm

Column: 4-mm \times 25-cm; packing L7

Column temperature: 25°

Flow rate: 1 mL/min

Injection size: 320 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1700 theoretical plates for the docosyl ferulate peak

Tailing factor: NMT 2.0 for docosyl ferulate

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the analyte peaks.

Calculate the percentage of the labeled amount of Extract as docosyl ferulate in the portion of the Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S \times V/W) \times (A_W \times 100/L_E) \times 100/L$$

r_U = peak response for docosyl ferulate from the *Sample solution*

r_S = peak response for docosyl ferulate from the *Standard solution*

C_S = concentration of USP Docosyl Ferulate RS in the *Standard solution* (mg/mL)

V = final volume of *Sample solution* (20.0 mL)

W = weight of the sample of Capsules taken to prepare the *Sample solution* (mg)

A_W = average weight of the Capsules contents (mg)

- L_E = content of docosyl ferulate in 100 mg of the Extract used to prepare the Capsules (mg)
 L = labeled amount of Extract per Capsule (mg/Capsule)

Acceptance criteria: 90%–110% of the labeled amount of Extract, calculated as docosyl ferulate and sterols (from *Content of Sterols*)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Rupture Test for Soft Shell Capsules*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** <2021>: The total bacterial count does not exceed 1000 cfu/g. The total combined molds and yeasts count does not exceed 1000 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: The Capsules meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the quantity of Extract, in mg/Capsule. Label the Capsules to indicate the quantity of sterols and docosyl ferulate in percentage of the Extract contained in the Capsules.
- **USP REFERENCE STANDARDS** <11>
 USP Docosyl Ferulate RS
 USP Pygeum Extract RS
 USP β -Sitosterol RS

Pyridoxine Hydrochloride—see *Pyridoxine Hydrochloride General Monographs*

Pyridoxine Hydrochloride Tablets—see *Pyridoxine Hydrochloride Tablets General Monographs*

Red Clover

DEFINITION

Red Clover consists of the dried inflorescence of *Trifolium pratense* L. (Fam. Fabaceae). It contains NLT 0.5% of isoflavones, calculated on the dried basis as the sum of daidzein, genistein, formononetin, and biochanin A.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution: Transfer 100 mg of USP Powdered Red Clover Extract RS to a screw-capped centrifuge tube. Add 1 mL of a mixture of alcohol and water (7:3), and heat in a steam bath for 10 min. Centrifuge, and use the clear supernatant.
Sample solution: Transfer 1 g of the powdered plant material to a screw-capped centrifuge tube. Add 10 mL of a mixture of methanol and water (3:2), heat in a steam bath for 10–15 min, cool, and filter.
Chromatographic system
 (See *Chromatography*, <621> *Thin-Layer Chromatography*.)

Adsorbent: 0.25 mm Layer of chromatographic silica gel mixture

Application volume: 20–30 μ L, in bands 2 cm long
Developing solvent system: Ethyl acetate, formic acid, glacial acetic acid, and water (100:11:11:27)

Spray reagent A: 10 mg/mL of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
 Develop the chromatograms to a length of NLT 18 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The *Sample solution* chromatogram exhibits a blue zone, a yellowish-green zone, and a yellowish-orange zone at R_f values of about 0.70, 0.55, and 0.50, respectively, corresponding in color and R_f to zones in the chromatogram of the *Standard solution*. Other colored zones of varying intensities may be observed in the chromatogram from the *Sample solution*.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed for *Content of Isoflavones*. Using the values obtained in the test for *Content of Isoflavones*, calculate the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones:

$$\text{Result} = (B + G)/(D + F)$$

B = percentage of biochanin A

G = percentage of genistein

D = percentage of daidzein

F = percentage of formononetin

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for daidzein, genistein, formononetin, and biochanin A at retention times that correspond to those in the chromatogram of *Standard solution A*, and the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones is between 0.1 and 10.

COMPOSITION

• CONTENT OF ISOFLAVONES

Solution A: Acetonitrile and water (1:3) containing 0.05% trifluoroacetic acid

Solution B: Acetonitrile containing 0.05% trifluoroacetic acid

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
2.5	87	13
7.5	80	20
7.8	73	27
8.0	55	45
11.0	50	50
13.0	40	60
15.0	26	74
16.0	0	100
18.1	100	0
23.0	100	0

Solvent: Alcohol and water (1:1)

Standard stock solution A: Transfer a quantity of USP Powdered Red Clover Extract RS, equivalent to 30 mg of the labeled content of isoflavones, to a 250-mL volumetric flask. Add 15 mL of dehydrated alcohol,

sonicate until dissolved, and dilute with *Solvent* to volume.

Standard solution A: Evaporate 50 mL of *Standard stock solution A* to dryness under vacuum. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 min. Quantitatively transfer the resulting solution, with the aid of 15 mL of alcohol, to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Centrifuge, or filter through a membrane having a 0.45- μ m or finer pore size.

Standard solution B: 0.1 mg/mL of USP Formononetin RS in a mixture of *n*-propanol and water (1:1). Sonicate, and filter through a membrane having a 0.45- μ m or finer pore size.

Sample stock solution: Transfer about 2.5 g of ground plant material, accurately weighed, into a 120-mL flask with a stopper. Add exactly 100 mL of *Solvent*, close the flask, and shake on an orbital or wrist-action shaker for NLT 12 h.

Sample solution: Evaporate 50 mL of *Sample stock solution* to dryness under vacuum at 40°. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 min. Quantitatively transfer this solution, with the aid of 15 mL of alcohol, to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Filter through a membrane having a 0.45- μ m or finer pore size, discarding the first 4 mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; end-capped 5- μ m packing L1

Column temperature: 45°

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution A*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the reference chromatogram provided with the lot of USP Powdered Red Clover Extract RS being used.

Tailing factor: NMT 2.0 for the formononetin peak
Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks corresponding to daidzein, genistein, formononetin, and biochanin A in the *Sample solution* chromatogram by comparison with the chromatogram obtained from *Standard solution A* and the reference chromatogram. Measure the areas of the analyte peaks. Separately calculate the percentages of daidzein, genistein, formononetin, and biochanin A in the portion of Red Clover taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 1/F \times D \times 100$$

r_U = peak response for each relevant isoflavone from the *Sample solution*

r_S = formononetin peak response from the *Standard solution B*

C_S = concentration of USP Formononetin RS in *Standard solution B* (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Red Clover used to prepare the *Sample solution* (mg)

F = conversion factor for each analyte: daidzein, 0.97; genistein, 1.13; formononetin, 1.00; biochanin A, 1.05

D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*, 1

Acceptance criteria: Add the percentages of daidzein, genistein, formononetin, and biochanin A: NLT 0.5% of isoflavones on the dried basis

CONTAMINANTS

- **HEAVY METALS** <231>: NMT 10 μ g/g
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10⁶ cfu/g, the total combined molds and yeast count does not exceed 10⁴ cfu/g, and the enterobacterial count is NMT 10³ cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Red Clover inflorescences are ovoid with a rounded summit, mostly 12–34 mm in length and width, usually on a very short stalk, shriveled, purplish, and more or less brown from drying, consisting of many papilionaceous flowers, crowded together and clothed at the base with broad, pointed, pale green ciliate stipules with darker veins. The flowers, which may or may not be accompanied by diminutive trifoliate leaves, are up to 15 mm in length and have the following: five green, hairy, subulate calyx teeth, one longer than the other four; petals united into a more or less campanulate tube, somewhat recurved, and colorless with pinkish purple veins; diadelphous stamens; slender style; a faintly aromatic, somewhat tea-like odor; and a sweet, then slightly bitter taste.

Microscopic: Epidermis of calyx composed of polygonal cells with faintly striated cuticle and occasional anomocytic stomata on the outer epidermis only; abundant, uniseriate, covering trichomes with two small, thin-walled basal cells and a thick-walled tapering end cell, up to 1 mm in length with a warty cuticle. Glandular trichomes are also present, particularly on the lower epidermis, each with a one- or two-celled stalk and a large, cylindrical head composed of several cells arranged in two rows. Epidermal cells of the corolla, papillose at the tip, are elongated with slightly wavy walls and a strongly striated cuticle; vascular strands of corolla and calyx are surrounded by a crystal sheath containing prismatic crystals of calcium oxalate. The following are also present: fibrous layer of anthers; subspherical pollen grains, 20–48 μ m in diameter with smooth exine, three distinct pores, and three furrows; upper epidermal cells of leaflets with sinuous and slightly beaded anticlinal walls; lower epidermis with sinuous to wavy walls; anomocytic stomata on both surfaces, but more frequent on the lower surface; abundant covering trichomes on both surfaces and on the margins; and fibrovascular strands surrounded by a crystal sheath containing prismatic crystals of calcium oxalate

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* <561>: NMT 2.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Water-Soluble Extractives, Method 2* <561>: NLT 15.0%
- **LOSS ON DRYING** <731>: Dry 1 g at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 10.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* <561>: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a well-closed, light-resistant container, protected from moisture.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

- **USP REFERENCE STANDARDS** <11>
USP Formononetin RS
USP Powdered Red Clover Extract RS

Powdered Red Clover

DEFINITION

Powdered Red Clover is Red Clover reduced to a powder or very fine powder. It contains NLT 0.5% of isoflavones, calculated on the dried basis as the sum of daidzein, genistein, formononetin, and biochanin A.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: Transfer 100 mg of USP Powdered Red Clover Extract RS to a screw-capped centrifuge tube. Add 1 mL of a mixture of alcohol and water (7:3), and heat in a steam bath for 10 min. Centrifuge, and use the clear supernatant.

Sample solution: Transfer 1 g of Powdered Red Clover to a screw-capped centrifuge tube. Add 10 mL of a mixture of methanol and water (3:2), heat in a steam bath for 10–15 min, cool, and filter.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20–30 µL, in bands 2 cm long

Developing solvent system: Ethyl acetate, formic acid, glacial acetic acid, and water (100:11:11:27)

Spray reagent A: 10 mg/mL of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms to a length of NLT 18 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The *Sample solution* chromatogram exhibits a blue zone, a yellowish-green zone, and a yellowish-orange zone at R_f values of about 0.70, 0.55, and 0.50, respectively, corresponding in color and R_f to zones in the chromatogram of the *Standard solution*. Other colored zones of varying intensities may be observed in the chromatogram from the *Sample solution*.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed for the *Content of Isoflavones*.

Using the values obtained in the test for *Content of Isoflavones*, calculate the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones:

$$\text{Result} = (B + G)/(D + F)$$

B = percentage of biochanin A

G = percentage of genistein

D = percentage of daidzein

F = percentage of formononetin

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for daidzein, genistein, formononetin, and biochanin A at retention times that correspond to those in the chromatogram of *Standard solution A*, and the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones is between 0.1 and 10.

COMPOSITION

• CONTENT OF ISOFLAVONES

Solution A: Acetonitrile and water (1:3) containing 0.05% trifluoroacetic acid

Solution B: Acetonitrile containing 0.05% trifluoroacetic acid

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
2.5	87	13
7.5	80	20
7.8	73	27
8.0	55	45
11.0	50	50
13.0	40	60
15.0	26	74
16.0	0	100
18.1	100	0
23.0	100	0

Solvent: Alcohol and water (1:1)

Standard stock solution A: Transfer a quantity of USP Powdered Red Clover Extract RS, equivalent to 30 mg of the labeled content of isoflavones, to a 250-mL volumetric flask. Add 15 mL of dehydrated alcohol, sonicate until dissolved, and dilute with *Solvent* to volume.

Standard solution A: Evaporate 50 mL of *Standard stock solution A* to dryness under vacuum. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 min. Quantitatively transfer the resulting solution, with the aid of 15 mL of alcohol, to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Centrifuge, or filter through a membrane having a 0.45-µm or finer pore size.

Standard solution B: 0.1 mg/mL of USP Formononetin RS in a mixture of *n*-propanol and water (1:1). Sonicate, and filter through a membrane having a 0.45-µm or finer pore size.

Sample stock solution: Transfer about 2.5 g of Powdered Red Clover, accurately weighed, into a 120-mL flask with a stopper. Add exactly 100 mL of *Solvent*, close the flask, and shake on an orbital or wrist-action shaker for NLT 12 h.

Sample solution: Evaporate 50 mL of *Sample stock solution* to dryness under vacuum at 40°. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 min. Quantitatively transfer this solution, with the aid of 15 mL of alcohol, to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Filter through a membrane having a 0.45-µm or finer pore size, discarding the first 4 mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; end-capped 5-µm packing L1

Column temperature: 45°

Flow rate: 1.0 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution A*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution A* is similar to the reference chromatogram provided with the lot of USP Powdered Red Clover Extract RS being used.

Tailing factor: NMT 2.0 for the formononetin peak
Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks corresponding to daidzein, genistein, formononetin, and biochanin A in the *Sample solution* chromatogram by comparison with the chromatogram obtained from *Standard solution A* and the reference chromatogram. Measure the areas of the analyte peaks. Separately calculate the percentages of daidzein, genistein, formononetin, and biochanin A in the portion of Powdered Red Clover taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 1/F \times D \times 100$$

r_U = peak response for each relevant isoflavone from the *Sample solution*

r_S = formononetin peak response from *Standard solution B*

C_S = concentration of USP Formononetin RS in *Standard solution B* (mg/mL)

V = volume of *Sample stock solution* (mL)

W = weight of Powdered Red Clover used to prepare the *Sample solution* (mg)

F = conversion factor for each analyte: daidzein, 0.97; genistein, 1.13; formononetin, 1.00; biochanin A, 1.05

D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*, 1

Acceptance criteria: Add the percentages of daidzein, genistein, formononetin, and biochanin A: NLT 0.5% of isoflavones on the dried basis

CONTAMINANTS

- **HEAVY METALS** <231>: NMT 10 µg/g
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* <561>: Meets the requirements
- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10^6 cfu/g, the total combined molds and yeast count does not exceed 10^4 cfu/g, and the enterobacterial count is NMT 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Brownish-red to greenish-red; numerous long, sharp-pointed, unicellular, nonglandular hairs with thick, nonlignified walls, the latter somewhat roughened by slight centrifugal projections; smooth, nearly spheroidal pollen grains from 20–48 µm in diameter; fragments of epidermis with stomata, the latter from 13–23 µm in length; fragments containing sclerenchyma fibers with adherent crystal fibers containing monoclinic prisms of calcium oxalate that are up to 21 µm in length
- **ARTICLES OF BOTANICAL ORIGIN**, *Water-Soluble Extractives, Method 2* <561>: NLT 15.0%
- **LOSS ON DRYING** <731>: Dry 1 g at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 10.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* <561>: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, protected from moisture.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.

• USP REFERENCE STANDARDS <11>

USP Formononetin RS
 USP Powdered Red Clover Extract RS

Powdered Red Clover Extract

DEFINITION

Powdered Red Clover Extract is prepared from Red Clover by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of plant material to extract is 3:1–25:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of isoflavones, calculated on the dried basis as the sum of daidzein, genistein, formononetin, and biochanin A. It may contain suitable added substances.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: Transfer 100 mg of USP Powdered Red Clover Extract RS to a screw-capped centrifuge tube. Add 1 mL of a mixture of alcohol and water (7:3), and heat in a steam bath for 10 min. Centrifuge, and use the clear supernatant.

Sample solution: Shake a quantity of Powdered Extract, equivalent to 25 mg of the labeled amount of isoflavones, in 20 mL of methanol. Allow to stand for 15 min before use.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Application volume: 20–30 µL, in bands 2 cm long

Developing solvent system: Ethyl acetate, formic acid, glacial acetic acid, and water (100:11:11:27)

Spray reagent A: 10 mg/mL of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
 Develop the chromatograms to a length of NLT 18 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent A* followed by *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The *Sample solution* chromatogram exhibits a blue zone, a yellowish-green zone, and a yellowish-orange zone at R_f values of about 0.70, 0.55, and 0.50, respectively, corresponding in color and R_f to zones in the chromatogram of the *Standard solution*. Other colored zones of varying intensities may be observed in the chromatogram from the *Sample solution*.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Isoflavones*.

Using the values obtained in the test for *Content of Isoflavones*, calculate the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones:

$$\text{Result} = (B + G)/(D + F)$$

B = percentage of biochanin A

G = percentage of genistein

D = percentage of daidzein

F = percentage of formononetin

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks for daidzein, genistein, formononetin, and biochanin A at retention times that correspond to those in the chromatogram of *Standard solution A*. The ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones is between 0.1 and 10.0.

COMPOSITION**• CONTENT OF ISOFLAVONES**

Solution A: Acetonitrile and water (1:3) containing 0.05% trifluoroacetic acid

Solution B: Acetonitrile containing 0.05% trifluoroacetic acid

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
2.5	87	13
7.5	80	20

18.1	100	0
23.0	100	0

Solvent: Alcohol and water (1:1)

Standard stock solution A: Transfer a quantity of USP Powdered Red Clover Extract RS, equivalent to 30 mg of the labeled content of isoflavones, to a 250-mL volumetric flask. Add 15 mL of dehydrated alcohol, sonicate until dissolved, and dilute with *Solvent* to volume.

Standard solution A: Evaporate 50 mL of *Standard stock solution A* to dryness under vacuum. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 min. Quantitatively transfer the resulting solution, with the aid of 15 mL of alcohol, to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Centrifuge, or filter through a membrane having a 0.45-μm or finer pore size.

Standard solution B: 0.1 mg/mL of USP Formononetin RS in a mixture of *n*-propanol and water (1:1). Sonicate, and filter through a membrane having a 0.45-μm or finer pore size.

Sample stock solution: Transfer a quantity of Powdered Extract, equivalent to 30 mg of the labeled content of isoflavones, to a 250-mL volumetric flask. Add 15 mL of dehydrated alcohol, sonicate until dissolved, and dilute with *Solvent* to volume.

Sample solution: Evaporate 50.0 mL of *Sample stock solution* to dryness under vacuum. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 min. Quantitatively transfer the resulting solution with the aid of 15 mL of alcohol to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Centrifuge, or pass through a filter of 0.45-μm or finer pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; end-capped 5-μm packing L1

Column temperature: 45°

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution A*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from *Standard solution A* is similar to the reference chromatogram provided with the lot of USP Powdered Red Clover Extract RS being used.

Tailing factor: NMT 2.0 for the formononetin peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks corresponding to daidzein, genistein, formononetin, and biochanin A in the *Sample solution* chromatogram by comparison with the chromatogram obtained from *Standard solution A* and the reference chromatogram. Measure the areas of the analyte peaks.

Separately calculate the percentage of each isoflavone in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 1/F \times 100$$

r_U = peak response for each relevant isoflavone from *Sample solution*

r_S = peak response for formononetin from *Standard solution B*

C_S = concentration of USP Formononetin RS in *Standard solution B* (mg/mL)

C_U = nominal concentration of isoflavones in the *Sample solution* (mg/mL)

F = conversion factor for each analyte: daidzein, 0.97; genistein, 1.13; formononetin, 1.00; biochanin A, 1.05

Acceptance criteria: 90.0%–110.0% of the labeled amount of isoflavones as the sum of daidzein, genistein, formononetin, and biochanin A, calculated on the dried basis

CONTAMINANTS

• HEAVY METALS, Method II <231>: NMT 10 μg/g

• MICROBIAL ENUMERATION TESTS <2021>: The total aerobic microbial count does not exceed 10⁴ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and the enterobacterial count is NMT 10³ cfu/g.

• ABSENCE OF SPECIFIED MICROORGANISMS <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

• LOSS ON DRYING <731>: Dry 1 g at 105° for 2 h: it loses NMT 5.0% of its weight.

• OTHER REQUIREMENTS: It meets the requirements for *Packaging and Storage*, *Residual Solvents*, and *Pesticide Residues* in *Botanical Extracts* <565>.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight, light-resistant containers, in a cool place.

• LABELING: The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of isoflavones, the extracting solvent or solvent mixture used for preparation, and the ratio of the starting crude plant material to Powdered Extract. It meets the requirements for labeling in *Botanical Extracts* <565>.

• USP REFERENCE STANDARDS <11>

S-Adenosyl-L-methionine Disulfate Tosylate

Former Title: Ademetionine Disulfate Tosylate

$C_{22}H_{34}N_6O_{16}S_4$ 766.80
S-(Adenosyl)-L-methionine disulfate tosylate;
(3S)-5'-[(3-Amino-3-carboxypropyl)methylsulfonio]-5'-deoxy-adenosine, disulfate-methylbenzenesulfonate
[97540-22-2].

DEFINITION

S-Adenosyl-L-methionine Disulfate Tosylate is the disulfate-tosylate mixed salt of a mixture of diastereoisomers of the S-adenosyl-L-methionine ion. It contains NLT 95.0% and NMT 105.0% of S-adenosyl-L-methionine disulfate tosylate ($C_{22}H_{34}N_6O_{16}S_4$) calculated through the content of S-adenosyl-L-methionine ($C_{15}H_{23}N_6O_5S^+$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of S-adenosyl-L-methionine in the *System suitability solution*, as obtained in the *CONTENT OF S-ADENOSYL-L-METHIONINE*.

COMPOSITION

• CONTENT OF S-ADENOSYL-L-METHIONINE

Solution A: 10 mL of glacial acetic acid in 500 mL of water. Add 2.06 g of sodium 1-hexanesulfonate, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Solution A* (15:85)

System suitability solution: 400 µg/mL each of USP S-Adenosyl-L-methionine Disulfate Tosylate RS and USP S-Adenosyl-L-homocysteine RS

Standard solution A: 400 µg/mL of USP S-Adenosyl-L-homocysteine RS

Standard solution B: 200 µg/mL from *Standard solution A*

Standard solution C: 80 µg/mL from *Standard solution A*

Sample solution: 20 mg of S-Adenosyl-L-methionine Disulfate Tosylate in 40 mL of water. Stir for 30 min, then dilute with water to 50.0 mL. Transfer 1.0 mL of the solution to a 1.5-mL microcentrifuge tube, and centrifuge for 1 min. Use a portion of the supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 3-µm packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution B*

[NOTE—The relative retention times for S-adenosyl-L-homocysteine and S-adenosyl-L-methionine disulfate tosylate are about 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between S-adenosyl-L-homocysteine and S-adenosyl-L-methionine

Tailing factor: NMT 1.5, *Standard solution B*

Relative standard deviation: NMT 2.0% for S-adenosyl-L-homocysteine, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

[NOTE—Record the chromatograms, and measure the area of the S-adenosyl-L-homocysteine peak in all three *Standard solutions* and the S-adenosyl-L-methionine disulfate tosylate peak in the *Sample solution*.]

Plot a calibration curve of the peak area of the *Standard solutions* versus the corresponding S-adenosyl-L-homocysteine concentration, in mg/mL, and draw the straight line best fitting the three points. From the calibration curve, and using the peak area of S-adenosyl-L-methionine from the chromatogram from the *Sample solution*, determine the concentration, C, in mg/mL, of S-adenosyl-L-methionine as S-adenosyl-L-homocysteine in the *Sample solution*.

Calculate the percentage of $C_{15}H_{23}N_6O_5S^+$ in the portion of S-Adenosyl-L-methionine Disulfate Tosylate taken:

$$\text{Result} = (C/C_U) \times (M_{r1}/M_{r2}) \times 100$$

C = concentration of S-adenosyl-L-methionine as S-adenosyl-L-homocysteine obtained from the linear regression line (mg/mL)

C_U = concentration of S-Adenosyl-L-Methionine Disulfate Tosylate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of S-adenosyl-L-methionine, 399.44

M_{r2} = molecular weight of S-adenosyl-L-homocysteine, 384.41

Acceptance criteria: 49.5%–54.7% on the anhydrous basis, equivalent to 95.0%–105% of S-adenosyl-L-methionine disulfate tosylate on the anhydrous basis

• **CONTENT OF SULFATE**

Mobile phase: 8.0 mM sodium carbonate and 1.0 mM sodium bicarbonate in water

Standard solution: 0.18 mg/mL of potassium sulfate

Sample solution: 0.5 mg/mL of S-Adenosyl-L-methionine Disulfate Tosylate

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Ion detector with suppressed conductivity

Column: 4.0-mm × 25-cm; 7-μm packing L74

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 8200 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Measure the area of the sulfate peak.]

Calculate the percentage of sulfate (SO₄) in the portion of S-Adenosyl-L-methionine Disulfate Tosylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sulfate from the *Sample solution*

r_S = peak response of sulfate from the *Standard solution*

C_S = concentration of sulfate (SO₄) in the *Standard solution* (mg/mL)

C_U = concentration of S-Adenosyl-L-methionine Disulfate Tosylate in the *Sample solution* (mg/mL)

Acceptance criteria: 23.5%–26.5%

IMPURITIES

• **HEAVY METALS,** *Method I* <231>: NMT 20 ppm

SPECIFIC TESTS

• **pH** <791>: 1.0–2.0, in an aqueous solution (1 in 20)

• **WATER DETERMINATION,** *Method Ia* <921>: NMT 3.0%

• **ISOMERIC RATIO**

Buffer: Transfer 4.2 g of citric acid monohydrate and 2.03 g of sodium dihydrogen phosphate dihydrate to a 1-L volumetric flask, and dissolve in and dilute with water to volume.

Mobile phase: 4.0 g of sodium dodecyl sulfate and 440 mL of acetonitrile. Dilute with *Buffer* to 1 L.

Standard solution: 1.0 mg/mL of USP S-Adenosyl-L-methionine Disulfate Tosylate RS

Sample solution: 1.0 mg/mL of S-Adenosyl-L-methionine Disulfate Tosylate

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.2 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for R,S-isomers and S,S-isomers are about 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.0 between the S,S-isomer and the R,S-isomer

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the peaks of the S,S- and R,S-isomers of the *Sample solution* by comparison with the *Standard solution*, and calculate the percentage of the S,S-isomer:

$$\text{Result} = [r_{SS}/(r_{SS} + r_{RS})] \times 100$$

r_{SS} = areas of the peaks corresponding to the S,S-isomer in the *Sample solution*

r_{RS} = areas of the peaks corresponding to the R,S-isomer in the *Sample solution*

Acceptance criteria: NLT 60% and NLT the labeled amount of the S,S-isomer

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a refrigerator.
- **LABELING:** Label it to indicate the minimum content of S,S-isomer, as a percentage.
- **USP REFERENCE STANDARDS** <11>
 - USP S-Adenosyl-L-methionine Disulfate Tosylate RS
 - USP S-Adenosyl-L-homocysteine RS

St. John's Wort

DEFINITION

St. John's Wort consists of the dried flowering tops or aerial parts of *Hypericum perforatum* L. (Fam. Hypericaceae), gathered shortly before or during flowering. It contains NLT 0.04% of the combined total of hypericin (C₃₀H₁₆O₈) and pseudohypericin (C₃₀H₁₆O₉) and NLT 0.6% of hyperforin (C₃₅H₅₂O₄), on the dried basis.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.5 mg/mL of USP Hyperoside RS in methanol

Sample solution: Finely powder 50 g of St. John's Wort. Shake 10 g in 100 mL of methanol for about 15 min, and filter.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 μL

Developing solvent system: Upper layer of a mixture of ethyl acetate, glacial acetic acid, formic acid, and water (10: 1.1: 1.1: 2.6)

Spray reagent A: 10-mg/mL solution of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50-mg/mL solution of polyethylene glycol 400 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands and allow to dry. Develop and allow the plate to air-dry. Spray with *Spray reagent A* and allow the plate to air-dry. Immediately after, spray the plate with *Spray reagent B*, and allow the plate to air-dry. Examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits several zones having a yellowish-orange fluorescence, one of which, appearing at an R_f value of about 0.5, corresponds in R_f value and intensity to a similar zone in the chromatogram of the *Standard solution*. The chromatogram of the *Sample solution* exhibits also two zones of red fluorescence, one at an R_f value of about 0.85 (presence of hypericin) and the other at an R_f value of about 0.80 (presence of pseudohypericin), and two zones of higher blue fluorescence (pres-

ence of chlorogenic and neochlorogenic acids) located below the yellow to yellowish-orange hyperoside zone.

COMPOSITION

- **CONTENT OF HYPERICIN AND PSEUDOHYPERICIN** [NOTE—Conduct all sample preparations with minimal exposure to subdued light, and use low-actinic glassware to protect solutions from light.]

Solvent: Methanol and acetone (1:1)

Solution A: Phosphoric acid and water (3:997)

Solution B: Acetonitrile

Solution C: Methanol

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	100	0	0
10	85	15	0
30	70	20	10
40	10	75	15
55	5	80	15
56	100	0	0
66	100	0	0

Standard solution A: 2.5 µg/mL of USP Oxybenzone RS in *Solvent*

Standard solution B: 1 mg/mL of USP Powdered St. John's Wort Extract RS in *Solvent*

Sample solution: Weigh and pulverize 10 g of St. John's Wort. Transfer 1 g to a round-bottom flask equipped with a condenser and protected from light, add 50 mL of *Solvent* and a magnetic stirring bar, and heat at 60° for 2 h while stirring. Cool to room temperature, and pass through filter paper into a 50-mL volumetric flask. Wash the flask and the residue on the filter with *Solvent*, and dilute with the washings to volume. Pass the solution through a polytetrafluoroethylene membrane filter having a 0.45-µm or finer pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm and Vis 588 nm

Columns

Guard: Packing L1

Analytical: 4.6-mm × 25-cm; packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 µL. [NOTE—First equilibrate the system with 100% *Solution A*.]

System suitability

Samples: *Standard solution A* (record the peak responses at 270 nm), and *Standard solution B* (record the peak responses at 270 nm and 588 nm)

Suitability requirements

Chromatogram similarity: The chromatograms from *Standard solution B* are similar to the respective reference chromatograms provided with the lot of USP Powdered St. John's Wort Extract RS being used.

Column efficiency: NLT 100,000 theoretical plates for oxybenzone, *Standard solution A*

Tailing factor: NMT 1.5 for oxybenzone, *Standard solution A*

Relative standard deviation: NMT 2.0%, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*
Measure the areas of the relevant peaks at 270 nm in the chromatogram of the *Sample solution*.

Separately calculate the percentage of hypericin (C₃₀H₁₆O₈) and pseudohypericin (C₃₀H₁₆O₉) in the portion of St. John's Wort taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of oxybenzone from *Standard solution A*

C_S = concentration of USP Oxybenzone RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of St. John's Wort taken to prepare the *Sample solution* (mg)

F = relative response factor for the relevant analyte relative to that of oxybenzone, 1.30 for hypericin and 1.24 for pseudohypericin

Calculate the combined total of hypericin and pseudohypericin by adding the corresponding percentages as calculated above.

Acceptance criteria: NLT 0.04% on the dried basis

• CONTENT OF HYPERFORIN

Analysis: Using the chromatograms obtained in the test for *Content of Hypericin and Pseudohypericin*, calculate the percentage of hyperforin (C₃₅H₅₂O₄) in the portion of St. John's Wort taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of hyperforin from the *Sample solution*

r_S = peak area of oxybenzone from *Standard solution A*

C_S = concentration of USP Oxybenzone RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of St. John's Wort taken to prepare the *Sample solution* (mg)

F = response factor for hyperforin relative to that of oxybenzone, 0.46

Acceptance criteria: NLT 0.6% on the dried basis

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli* and for absence of *Staphylococcus aureus*.

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: The two-edged stem is greenish yellow, rounded, and has two ribs running longitudinally on opposite sides. The plant is adversifoliate, its leaves are sessile, ovoid or elongated, up to 3.5 cm in length, smooth-edged, and hairless with translucent perforations. The very numerous yellow, short-stemmed, pentamerous flowers form false umbels shaped like grape clusters. The five lanceolate and black-dotted sepals are about one-half the length of the dark yellow petals, which are shaped like slanted ovals and whose edges are set with dark red glands. The numerous stamens are joined in three to six bundles (usually three). The ovary is surmounted by three styles. Some ovaries are already developed into greenish, elongated, oval triovular capsules with various degrees of maturity. When chopped, the crude plant material is distinguished by numerous yellow to yellowish-brown flower buds and individual petals with dark red glands at the edges. The light green to brown-green leaf

fragments, characterized by plicate marcescence, appear stippled when held up to the light. The greenish yellow or reddish-brown hollow stem fragments are distinguished by two longitudinal edges.

Microscopic: The stems have elongated epidermal cells with straight beaded, anticlinal walls; cuticle smooth; frequent paracytic stomata with two small adjacent epidermal cells; cortex of 5–6 rows of collenchyma; stele with secondary growth consisting of a compacted ring of phloem, with a wide area of lignified xylem and small areas of intraxylary phloem; parenchymatous pith, lignified and pitted in older stems; oil glands may occur in the cortex and phloem.

The upper surface of the leaf has polygonal cells with sinuous, slightly beaded anticlinal walls; cells of lower surface smaller, with anticlinal walls more wavy with frequent paracytic, sometimes anomocytic, stomata; smooth cuticle, thicker on upper surface, straight-walled, elongated epidermal cells of veins occasionally beaded. Dorsiventral, single palisade lamina; large oil glands equal to depth of spongy mesophyll. Midrib containing single, collateral bundle with small area of lignified xylem. Trichomes and calcium oxalate are absent.

The sepal of the flower has characteristics resembling those of the leaf. Petal, narrow, elongated, thin-walled, epidermal cells with straight anticlinal walls on the outer surface and wavy on the inner surface. Stamen, lignified fibrous layer of anther wall; elongated, thin-walled cells of filament with striated cuticle; subprolate pollen grains, about 20 µm in diameter with three pores and a smooth exine. Ovary, small polygonal cells with underlying oil glands; seed testa, brown, thick-walled hexagonal cells.

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 5.0%
- **ARTICLES OF BOTANICAL ORIGIN, Water Content** <561>: NMT 10.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in tight containers, protected from light and moisture.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.
- **USP REFERENCE STANDARDS** <11>
 - USP Hyperoside RS
 - USP Oxybenzone RS
 - USP Powdered St. John's Wort Extract RS
 - USP Rutin RS

Powdered St. John's Wort

DEFINITION

Powdered St. John's Wort is St. John's Wort reduced to a fine or a very fine powder. It contains NLT 0.6% of hyperforin (C₃₅H₅₂O₄) and NLT 0.04% of hypericin (C₃₀H₁₆O₈) and pseudohypericin (C₃₀H₁₆O₉) combined, on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
 - Standard solution:** 0.5 mg/mL of USP Hyperoside RS in methanol
 - Sample solution:** Shake 10 g of Powdered St. John's Wort in 100 mL of methanol for 15 min, and filter.
 - Chromatographic system**
(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 µL

Developing solvent system: Upper layer of a mixture of ethyl acetate, glacial acetic acid, formic acid, and water (10: 1.1: 1.1: 2.6)

Spray reagent A: 10-mg/mL solution of 2-aminoethyl diphenylborinate in methanol

Spray reagent B: 50-mg/mL solution of polyethylene glycol 400 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands and allow to dry. Develop and allow the plate to air-dry. Spray with *Spray reagent A* and allow the plate to air-dry. Immediately after, spray the plate with *Spray reagent B*, and allow the plate to air-dry. Examine the plate under UV light at 365 nm.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits several zones having a yellowish-orange fluorescence, one of which, appearing at an *R_f* value of about 0.5, corresponds in *R_f* value and intensity to a similar zone in the chromatogram of the *Standard solution*. The chromatogram of the *Sample solution* exhibits also two zones of red fluorescence, one at an *R_f* value of about 0.85 (presence of hypericin) and the other at an *R_f* value of about 0.80 (presence of pseudohypericin), and two zones of higher blue fluorescence (presence of chlorogenic and neochlorogenic acids) located below the yellow to yellowish-orange hyperoside zone.

USP Hyperoside RS

USP Oxybenzone RS

USP Powdered St. John's Wort Extract RS

USP Rutin RS

Powdered St. John's Wort Extract

DEFINITION

Powdered St. John's Wort Extract is prepared from comminuted St. John's Wort extracted with 80% methanol or other suitable solvents. It contains NLT 90.0% and NMT 110.0% of the labeled combined total of hypericin (C₃₀H₁₆O₈) and pseudohypericin (C₃₀H₁₆O₉) and NLT 90.0% and NMT 110.0% of hyperforin (C₃₅H₅₂O₄), on the dried basis.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST:** (presence of hypericin, pseudohypericin, hyperoside, and rutin)

Standard solution: 50 mg/mL of USP Powdered St. John's Wort Extract RS in methanol. Shake well, and use the clear supernatant.

Sample solution: 50 mg/mL of Powdered Extract in methanol. Shake well, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Upper layer of a mixture of ethyl acetate, glacial acetic acid, formic acid, and water (10: 1.1: 1.1: 2.6)

Spray reagent A: 10 mg/mL of diphenylborinic acid, ethanolamine ester in methanol

Spray reagent B: 50 mg/mL of polyethylene glycol 400 in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatogram until the solvent front has moved NLT 18 cm, and dry the plate with the aid of a current of air. Spray the plate with *Spray reagent A*, then with *Spray reagent B*, and examine the plate under UV light at 365 nm.

Acceptance criteria: The two red zones due to hypericin and pseudohypericin at R_f values of about 0.85 and 0.80, respectively, in the chromatogram of the *Sample solution*, correspond in color and R_f value to those in the chromatogram of the *Standard solution*; the two yellow zones due to hyperoside and rutin at R_f values of about 0.50 and 0.35, respectively, in the chromatogram of the *Sample solution*, correspond in color and R_f value to those in the chromatogram of the *Standard solution*. Other colored zones of various intensities may be observed in the chromatogram of the *Sample solution*.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST:

(presence of hyperforin)

Standard solution and Sample solution: Proceed as directed in *Identification test A*.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Solvent hexane and ethyl acetate (4:1)

Spray reagent: Prepare a solution containing 0.38 g of ceric ammonium sulfate and 3.8 g of ammonium molybdate in 100 mL of 2 N sulfuric acid.

Analysis

Samples: *Standard solution* and *Sample solution*
Develop the chromatograms in a saturated chamber until the solvent front has moved NLT 18 cm, and dry the plate with the aid of a current of air. Spray the plate with *Spray reagent*, heat the plate at 140° for 15 min, and examine under UV light.

Acceptance criteria: The blue zone due to hyperforin at an R_f value of about 0.54 in the chromatogram of the *Sample solution* corresponds in color and R_f value to that in the chromatogram of the *Standard solution*.

COMPOSITION

• CONTENT OF HYPERICIN AND PSEUDOHYPERICIN

[NOTE—Conduct all sample preparations with minimal exposure to subdued light, and use low-actinic glassware to protect solutions from light.]

Solvent: Methanol and acetone (1:1)

Solution A: Phosphoric acid and water (3:997)

Solution B: Acetonitrile

Solution C: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	100	0	0
10	85	15	0
30	70	20	10
40	10	75	15
55	5	80	15
56	100	0	0
66	100	0	0

Standard solution A: 2.5 μ g/mL of USP Oxybenzone RS in *Solvent*

Standard solution B: 1 mg/mL of USP Powdered St. John's Wort Extract RS in *Solvent*

Sample solution: 1 mg/mL of Powdered Extract in a mixture of methanol and water (9:1). Sonicate to dissolve, pass through a polytetrafluoroethylene membrane filter having a 0.45- μ m or finer pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm and Vis 588 nm

Columns

Guard: Packing L1

Analytical: 4.6-mm \times 25-cm; packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 μ L. [NOTE—First equilibrate the system with 100% *Solution A*.]

System suitability

Samples: *Standard solution A* (record the peak responses at 270 nm) and *Standard solution B* (record the peak responses at 270 and 588 nm)

Suitability requirements

Chromatogram similarity: The chromatograms from *Standard solution B* are similar to the respective reference chromatograms provided with the lot of USP Powdered St. John's Wort Extract RS being used.

Column efficiency: NLT 100,000 theoretical plates for oxybenzone, *Standard solution A*

Tailing factor: NMT 1.5 for oxybenzone, *Standard solution A*

Relative standard deviation: NMT 2.0%, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*
Measure the areas at 270 nm of the relevant peaks in the chromatogram of the *Sample solution*.

Calculate the percentage of the labeled amount of hypericin ($C_{30}H_{16}O_8$) and pseudohypericin ($C_{30}H_{16}O_9$) in the portion of Powdered St. John's Wort Extract taken:

$$\text{Result} = (\sum r_{ui}/f_i) \times (1/r_s) \times (C_s/C_u) \times 100$$

$\sum r_{ui}/f_i$ = sum of the peak areas of hypericin and pseudohypericin from the *Sample solution* divided by their respective response factors relative to oxybenzone, 1.30 for hypericin and 1.24 for pseudohypericin

r_s = peak area of oxybenzone from *Standard solution A*

C_s = concentration of USP Oxybenzone RS in *Standard solution A* (mg/mL)

C_u = nominal concentration of the total hypericins content in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% on the dried basis

• CONTENT OF HYPERFORIN

Analysis: Using the chromatograms obtained in the test for *Content of Hypericin and Pseudohypericin*, calculate the percentage of hyperforin ($C_{35}H_{52}O_4$) in the portion of Powdered St. John's Wort Extract taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 1/F \times 100$$

r_u = peak area of hyperforin from the *Sample solution*

r_s = peak area of oxybenzone from *Standard solution A*

C_s = concentration of USP Oxybenzone RS in the *Standard solution A* (mg/mL)

C_u = nominal concentration of the hyperforin in the *Sample solution* (mg/mL)

F = relative response factor for hyperforin relative to that of oxybenzone, 0.46

Acceptance criteria: 90.0%–110.0% on the dried basis

CONTAMINANTS

- **HEAVY METALS, Method II (231):** NMT 50 µg/g
- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis (561):** Meets the requirements
- **MICROBIAL ENUMERATION TESTS (2021):** The total bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts does not exceed 10³ cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 5%
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 7.0%
- **OTHER REQUIREMENTS:** It meets the requirements in *Botanical Extracts (565)*, *Residue on Evaporation* and *Residual Solvents*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from moisture and light.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of hypericin, pseudohypericin, and hyperforin; the extracting solvent or solvent mixture used for preparation; and the ratio of the starting crude plant material to Powdered Extract. The label bears a statement indicating that "Rare cases of allergic reactions and photosensitivity have been reported with the use of St. John's Wort. St. John's Wort interacts with numerous medications. Check with your health care provider before using."
- **USP REFERENCE STANDARDS (11)**
 - USP Oxybenzone RS
 - USP Powdered St. John's Wort Extract RS
 - USP Rutin RS

SAMe—see *S-adenosyl-L-methionine Disulfate Tosylate*

Saw Palmetto

DEFINITION

Saw Palmetto consists of partially dried, ripe fruit of *Serenoa repens* (W. Bartram) Small (Fam. Arecaceae) [*Serenoa serotatum* Schult.; *Sabal serrulata* (Michx.) Nutt. ex Schult. & Schult. f.]. It contains NLT 2% (v/w) of volatile oil, NLT 7% of lipophilic extract, and NLT 9.0% of total fatty acids.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

[NOTE—Perform the following test under subdued light.]

Reagent solution: 3.7 mg/mL of 4-bromomethyl-7-methoxycoumarin in acetone. Store this solution in a dark place.

Standard solution: 5.0 g of magnesium stearate in a 100-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of ether, 20 mL of 12.5% nitric acid, and 20 mL of water, and heat until solution is complete. Cool, transfer the contents of the flask to a separatory funnel, and withdraw the lower aqueous phase. Extract the ether phase twice, each time using 4 mL of water, separating the aqueous phases. Extract the combined aqueous phases with 15 mL of ether, combining

the ether extracts. Evaporate to dryness, and dry the residue at 105°. Transfer 1 mg of the residue to an amber glass vial fitted with a metal-clamped rubber cap. Add 10 mg of lithium carbonate, 3 µL of tris-[2-(2-methoxyethoxy)ethyl]amine, and 1.0 mg of the *Reagent solution*. Replace the metal-clamped rubber cap, dry at 105° for 2 h, and cool.

Sample solution: 10.0 g of finely powdered Saw Palmetto in a 250-mL round-bottom flask fitted with a reflux condenser. Add 150 mL of alcohol, and heat under a reflux condenser on a steam bath for 1 h. Cool, filter, wash the residue with alcohol, and dilute the combined washings and filtrate with alcohol to 200.0 mL. Transfer 0.6 mL of this solution to a suitable flask, and evaporate to dryness. To the residue add 1.0 mL of the *Reagent solution*. Transfer this solution with the aid of a pipet to an amber glass vial fitted with a metal-clamped rubber cap. Add 3 µL of tris-[2-(2-methoxyethoxy)ethyl]amine and 10 mg of lithium carbonate to the vial. Replace the metal-clamped rubber cap, dry at 105° for 2 h, and cool.

Blank solution: To 10 mg of lithium carbonate in an amber glass vial fitted with a metal-clamped rubber cap, add 3 µL of tris-[2-(2-methoxyethoxy)ethyl]amine and 1.0 mL of the *Reagent solution*. Replace the metal-clamped rubber cap, dry at 105° for 2 h, and cool.

Chromatographic system

(See *Chromatography (621)*, *Thin-Layer Chromatography*.)

Absorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm in length (TLC plates)

Application volume: 2 µL

Developing solvent system: Cyclohexane, ethyl acetate, and acetic acid (70:30:1)

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

Develop the chromatograms in the solvent system until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, mark the solvent front, and allow the plate to air-dry. Examine the plate under long-wave-length UV light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits at least two zones of blue fluorescence corresponding in *R_F* values to similar zones exhibited in the *Standard solution*. The blue fluorescent zones from the *Sample solution* appear above the blue fluorescent zones exhibited in the *Blank solution*.

COMPOSITION

- **ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Determination (561):** NLT 2% (v/w) of an oil that solidifies to a white solid at room temperature

- **CONTENT OF LIPOPHILIC EXTRACT**

Analysis: Transfer 10 g of pulverized Saw Palmetto to a 250-mL round-bottom flask fitted with a reflux condenser, and add 150 mL of alcohol. Heat the flask on a boiling water bath under reflux for 1 h. Cool, filter, and wash the residue with small portions of alcohol. Collect the filtrate and washings in a 200-mL volumetric flask, and dilute with alcohol to volume. Evaporate 100.0 mL of this solution to dryness in a rotary evaporator under vacuum. Add 40 mL of *n*-hexane to the residue, stir for 5 min, filter, and collect the filtrate in a round-bottom flask. Repeat the above operation of washing with *n*-hexane two more times, and collect all of the filtrates in the same flask. Using a rotary evaporator, evaporate off the organic solvent to dryness. Dry the residue obtained at 105° for 2 h.

Acceptance criteria: The weight of the residue is NLT 0.35 g (NLT 7%).

- **CONTENT OF FATTY ACIDS**

Internal standard solution: 12 mg/mL of nonadecane in hexanes

Standard stock solution: Dissolve quantities of USP Methyl Laurate RS, USP Methyl Oleate RS, USP Methyl Myristate RS, USP Methyl Palmitate RS, USP Methyl Linoleate RS, USP Methyl Caproate RS, USP Methyl Caprylate RS, USP Methyl Caprate RS, USP Methyl Palmitoleate RS, USP Methyl Stearate RS, and USP Methyl Linolenate RS in hexanes to obtain concentrations of each methyl ester as given in the *Table 1*.

Table 1

Methyl Ester	Concentration (mg/mL)
Methyl laurate	5
Methyl oleate	5
Methyl myristate	2
Methyl palmitate	2
Methyl linoleate	1
Methyl caproate	0.4
Methyl caprylate	0.4
Methyl caprate	0.4
Methyl palmitoleate	0.4
Methyl stearate	0.4
Methyl linolenate	0.4

Standard solution: Transfer 1.0 mL of *Internal standard solution* to 5.0 mL of the *Standard stock solution*.

Sample solution: Pulverize 50 g of dried Saw Palmetto to a moderately coarse powder. Transfer a quantity of 1 g of the pulverized powder to a 100-mL round-bottom flask fitted with a water-cooled reflux condenser and a magnetic bar. Add 10 mL of 0.5 N methanolic sodium hydroxide solution (20 mg/mL of sodium hydroxide in methanol), and heat the flask with stirring under reflux conditions for 15 min. Pipet 5 mL of a solution of boron trifluoride in methanol (140 mg/mL of boron trifluoride in methanol) through the reflux condenser into the flask, and continue boiling for 2 more min. Add 5.0 mL of hexanes through the condenser, and continue boiling for an additional 1 min. Cool the flask, remove the condenser, add 15 mL of saturated sodium chloride solution, and add 1.0 mL of the *Internal standard solution*. While the solution is still tepid, insert a stopper into the flask, and shake vigorously. Pipet 1.0 mL of the upper hexanes layer into a glass-stoppered test tube containing a small quantity of anhydrous sodium sulfate. Filter the solution, and, if necessary, dilute a volume of the filtrate with hexanes to obtain a known volume. [NOTE—Store this solution in a refrigerator until just before use.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m fused silica capillary; 0.25-μm film of phase G16 coating

Temperature

Injector: 250°

Detector: 300°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
120	0	120	3
120	50	220	12

Carrier gas: Helium

Flow rate: 1 mL/min

Injection size: 1 μL

System suitability

Sample: *Standard solution*

[NOTE—See *Table 3* for the relative retention times.]

Table 3

Methyl Ester	Relative Retention Time
Methyl caproate	0.39
Methyl caprylate	0.56
Methyl caprate	0.76
Methyl laurate	0.94
Nonadecane (internal standard)	1.0
Methyl myristate	1.1
Methyl palmitate	1.3
Methyl palmitoleate	1.35
Methyl stearate	1.65
Methyl oleate	1.7
Methyl linoleate	1.8
Methyl linolenate	2.0

Suitability requirements

Resolution: NLT 1.5 between methyl stearate and methyl oleate

Tailing factor: NMT 2.0 for each of the methyl ester peaks

Relative standard deviation: NMT 5.0% for each of the methyl ester peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each fatty acid in the portion of the Saw Palmetto taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times V) \times (1/W) \times (M_{r1}/M_{r2}) \times 100$$

R_U = peak response ratio of the relevant methyl ester to the internal standard obtained from the *Sample solution*

R_S = peak response ratio of the relevant methyl ester to the internal standard obtained from the *Standard solution*

C_S = concentration of the respective methyl ester in the *Standard stock solution* (mg/mL)

V = volume of the *Standard stock solution* used to prepare the *Standard solution* (mL)

W = weight of Saw Palmetto taken to prepare the *Sample solution* (mg)

M_{r1} = molecular weight of the relevant fatty acid

M_{r2} = molecular weight of the methyl ester of the relevant fatty acid

Acceptance criteria: NLT 9.0% for the sum of the percentages of all the fatty acids. See *Table 4* for individual fatty acids.

Table 4

Individual Fatty Acids	Percentages (%)
Oleic acid	NLT 3.0
Lauric acid	NLT 2.0
Myristic acid	NLT 1.2
Palmitic acid	NLT 1.0
Linoleic acid	NLT 0.4
Caproic acid	NLT 0.2
Caprylic acid	NLT 0.2
Capric acid	NLT 0.2
Stearic acid	NLT 0.1

Table 4 (Continued)

Individual Fatty Acids	Percentages (%)
Linolenic acid	NLT 0.05
Palmitoleic acid	NLT 0.01

CONTAMINANTS

- **HEAVY METALS** (231): NMT 10 µg/g
- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total bacterial count does not exceed 10⁴ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the test for absence of *Salmonella* species and *Escherichia coli* and for absence of *Staphylococcus aureus*.

SPECIFIC TESTS**• BOTANIC CHARACTERISTICS**

Macroscopic: Subspherical to ovoid drupes, about 2–3 cm in length and about 1.5 cm thick, dark brown to black with a smooth, dull surface and with large, irregular depressions and ridges caused by shrinkage on drying; remains of style at the summit; base bearing a small depression with the scar of the stalk; epicarp and underlying sarcocarp forming a fragile layer that partially peels off, revealing the hard, pale brown layer of endocarp surrounding the seed. Seed irregularly spherical to ovoid, up to about 1.2 cm in length and 1 cm in width, hard, surface finely pitted and reddish brown with a paler, raised and membranous area over the raphe and micropyle; when cut transversely, it shows a thin testa, a narrow perisperm, and a large area of dense, horny, grayish-white endosperm.

Microscopic: The pulp is covered by a small-celled, thin-walled epidermis and consists chiefly of a very large-celled, mostly thin-walled parenchyma. The outermost layers contain brown substances; farther inside, single cells only with brown contents are scattered in the tissue; occasional large, thick-walled, rather punctate stone cells with a wide lumen are also found. The vascular bundles are accompanied by fibers with cover cells (stigmata) containing siliceous solids attached. The innermost layers of the pulp wall consist of almost completely thickened, rather punctate, quite irregularly shaped stone cells (astrosclereids). The outer layers of the seed coat are large-celled, the cells are coarse-walled; the middle layers are thin-walled, the cells are smaller; the innermost layers are small-celled, flattened. All cells are filled with a brown substance. On the outside, the endosperm exhibits radial elongated, nonpunctate, coarse-walled cells; in the deeper layers, the cells are larger, thick-walled, rather coarse punctate. The middle lamella is fairly recognizable. Aleurone with protein crystalloids is present in the cell contents.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** (561): NMT 2.0%
- **LOSS ON DRYING** (731): Dry 1.0 g of finely powdered Saw Palmetto at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 5.0%, determined on 1.0 g of finely powdered Saw Palmetto
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** (561): NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

Powdered Saw Palmetto**DEFINITION**

Powdered Saw Palmetto is Saw Palmetto reduced to a fine or a very fine powder. It contains NLT 2% (v/w) of volatile oil, NLT 7% of lipophilic extract, and NLT 9.0% of total fatty acids.

IDENTIFICATION**• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

[NOTE—Perform the following test under subdued light.]

Reagent solution: 3.7 mg/mL of 4-bromomethyl-7-methoxycoumarin in acetone. Store this solution in a dark place.

Standard solution: 5.0 g of magnesium stearate in a 100-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of ether, 20 mL of 12.5% nitric acid, and 20 mL of water, and heat until solution is complete. Cool, transfer the contents of the flask to a separatory funnel, and withdraw the lower aqueous phase. Extract the ether phase twice, each time using 4 mL of water, separating the aqueous phases. Extract the combined aqueous phases with 15 mL of ether, combining the ether extracts. Evaporate to dryness, and dry the residue at 105°. Transfer 1 mg of the residue to an amber glass vial fitted with a metal-clamped rubber cap. Add 10 mg of lithium carbonate, 3 µL of tris-[2-(2-methoxyethoxy)ethyl]amine, and 1.0 mg of the *Reagent solution*. Replace the metal-clamped rubber cap, dry at 105° for 2 h, and cool.

Sample solution: 10.0 g of Powdered Saw Palmetto in a 250-mL round-bottom flask fitted with a reflux condenser. Add 150 mL of alcohol, and heat under a reflux condenser on a steam bath for 1 h. Cool, filter, wash the residue with alcohol, and dilute the combined washings and filtrate with alcohol to 200.0 mL. Transfer 0.6 mL of this solution to a suitable flask, and evaporate to dryness. To the residue add 1.0 mL of the *Reagent solution*. Transfer this solution with the aid of a pipet to an amber glass vial fitted with a metal-clamped rubber cap. Add 3 µL of tris-[2-(2-methoxyethoxy)ethyl]amine and 10 mg of lithium carbonate to the vial. Replace the metal-clamped rubber cap, dry at 105° for 2 h, and cool. Use the cooled solution.

Blank solution: To 10 mg of lithium carbonate in an amber glass vial fitted with a metal-clamped rubber cap, add 3 µL of tris-[2-(2-methoxyethoxy)ethyl]amine and 1.0 mL of the *Reagent solution*. Replace the metal-clamped rubber cap, dry at 105° for 2 h, and cool.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Absorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm in length (TLC plates)

Application volume: 2 µL

Developing solvent system: Cyclohexane, ethyl acetate, and acetic acid (70:30:1)

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

Develop the chromatograms in the solvent system until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, mark the solvent front, and allow the plate to air-dry. Examine the plate under long-wavelength UV light.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits at least two zones of blue fluorescence corresponding in R_F values to similar zones exhibited in the *Standard solution*. The blue fluorescent zones from the *Sample solution* appear above the blue fluorescent zones exhibited in the *Blank solution*.

COMPOSITION

- **ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Determination (561):** NLT 2 mL/100 g of an oil that solidifies to a white solid at room temperature

- **CONTENT OF LIPOPHILIC EXTRACT**

Analysis: Transfer 10 g of Powdered Saw Palmetto to a 250-mL round-bottom flask fitted with a reflux condenser, and add 150 mL of alcohol. Heat the flask on a boiling water bath under reflux for 1 h. Cool, filter, and wash the residue with small portions of alcohol. Collect the filtrate and washings in a 200-mL volumetric flask, and dilute with alcohol to volume. Evaporate 100.0 mL of this solution to dryness in a rotary evaporator under vacuum. Add 40 mL of *n*-hexane to the residue, stir for 5 min, filter, and collect the filtrate in a round-bottom flask. Repeat the above operation of washing with *n*-hexane two more times, and collect all of the filtrates in the same flask. Using a rotary evaporator, evaporate off the organic solvent to dryness. Dry the residue obtained at 105° for 2 h.

Acceptance criteria: The weight of the residue is NLT 0.35 g (NLT 7%).

- **CONTENT OF FATTY ACIDS**

Internal standard solution: 12 mg/mL of nonadecane in hexanes.

Standard stock solution: Dissolve quantities of USP Methyl Laurate RS, USP Methyl Oleate RS, USP Methyl Myristate RS, USP Methyl Palmitate RS, USP Methyl Linoleate RS, USP Methyl Caproate RS, USP Methyl Caprylate RS, USP Methyl Caprate RS, USP Methyl Palmitoleate RS, USP Methyl Stearate RS, and USP Methyl Linolenate RS in hexanes to obtain concentrations of each methyl ester as given in the *Table 1*.

Table 1

Methyl Ester	Concentration (mg/mL)
Methyl laurate	5
Methyl oleate	5
Methyl myristate	2
Methyl palmitate	2
Methyl linoleate	1
Methyl caproate	0.4
Methyl caprylate	0.4
Methyl caprate	0.4
Methyl palmitoleate	0.4
Methyl stearate	0.4
Methyl linolenate	0.4

Standard solution: Transfer 1.0 mL of *Internal standard solution* to 5.0 mL of *Standard stock solution*.

Sample solution: Transfer 1 g of Powdered Saw Palmetto to a 100-mL round-bottom flask fitted with a water-cooled reflux condenser and a magnetic bar. Add 10 mL of 0.5 N methanolic sodium hydroxide solution (20 mg/mL of sodium hydroxide in methanol), and heat the flask with stirring under reflux conditions for

15 min. Pipet 5 mL of a solution of boron trifluoride in methanol (140 mg/mL of boron trifluoride in methanol) through the reflux condenser into the flask, and continue boiling for 2 more min. Add 5.0 mL of hexanes through the condenser, and continue boiling for an additional 1 min. Cool the flask, remove the condenser, add 15 mL of saturated sodium chloride solution, and add 1.0 mL of the *Internal standard solution*. While the solution is still tepid, insert a stopper into the flask, and shake vigorously. Pipet 1.0 mL of the upper hexanes layer into a glass-stoppered test tube containing a small quantity of anhydrous sodium sulfate. Filter the solution, and, if necessary, dilute a volume of the filtrate with hexanes to obtain a known volume. [NOTE—Store this solution in a refrigerator until just before use.]

Saw Palmetto Extract

DEFINITION

Saw Palmetto Extract is obtained from comminuted Saw Palmetto by extraction with hydroalcoholic mixtures or solvent hexane, or by supercritical extraction with carbon dioxide. The ratio of starting crude plant material to Extract is from 8.0:1 to 14.3:1. The Extract contains NLT 70.0% and NMT 95.0% of fatty acids and NLT 0.2% and NMT 0.5% of sterols, calculated on the anhydrous basis. The lipophilic Extract contains NLT 0.15% and NMT 0.35% of long-chain alcohols. The hydroalcoholic Extract contains NLT 0.01% and NMT 0.15% of long-chain alcohols. It contains no added substances.

IDENTIFICATION

• A. GAS CHROMATOGRAPHY

Analysis: Proceed as directed in *Content of Fatty Acids*.

Acceptance criteria: The retention times of the 11 major peaks of the *Sample solution* correspond to those in the chromatogram of the *Standard solution*. The ranges for ratios of the concentration of lauric acid to the concentration of the respective fatty acid are in *Table 1*.

Table 1

Fatty Acid	Minimum Ratio	Maximum Ratio
Capric	9.0	16
Caproic	8.5	24
Caprylic	8.5	17.5
Linoleic	5.0	16
Linolenic	31.5	55
Myristic	2.2	2.8
Oleic	0.60	1.15
Palmitic	2.8	3.9
Stearic	14	26

COMPOSITION

• CONTENT OF FATTY ACIDS

Internal standard solution: 12 mg/mL of nonadecane in hexanes

Standard stock solution: Dissolve quantities of USP Methyl Laurate RS, USP Methyl Oleate RS, USP Methyl Myristate RS, USP Methyl Palmitate RS, USP Methyl Linoleate RS, USP Methyl Caproate RS, USP Methyl Caprylate RS, USP Methyl Caprate RS, USP Methyl Palmitoleate RS, USP Methyl Stearate RS, and USP Methyl Linolenate RS in hexanes to obtain concentrations of each methyl ester as given in the *Table 2*.

Table 2

Methyl Ester	Concentration (mg/mL)
Methyl laurate	5
Methyl oleate	5
Methyl myristate	2
Methyl palmitate	2
Methyl linoleate	1
Methyl caproate	0.4
Methyl caprylate	0.4
Methyl caprate	0.4
Methyl palmitoleate	0.4
Methyl stearate	0.4
Methyl linolenate	0.4

Standard solution: Transfer 1.0 mL of *Internal standard solution* to 5.0 mL of the *Standard stock solution*.

Sample solution: Transfer 100 mg of Extract to a pressure-proof, screw-capped vial, and add 3.0 mL of a solution of sulfuric acid in methanol (5 in 100). Heat at 100° in an oil bath for 2 h, shaking from time to time. Allow to cool, and add 1.0 mL of *Internal standard solution*, 10.0 mL of water, 1 g of sodium chloride, and 5 mL of hexanes. Shake well, allow the layers to separate completely, and use the hexanes layer. [NOTE—Store in a refrigerator until ready to use.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m fused silica capillary; 0.25-μm film of phase G16 coating

Suitability requirements

Resolution: NLT 1.5 between methyl stearate and methyl oleate peaks

Tailing factor: NMT 2.0 for each of the methyl ester peaks

Relative standard deviation: NMT 5.0% for each of the methyl ester peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each fatty acid in the portion of Extract taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times V) \times (1/W) \times (M_{r1}/M_{r2}) \times 100$$

R_U = peak response ratio of the relevant methyl ester to the internal standard from the *Sample solution*

R_S = peak response ratio of the relevant methyl ester to the internal standard from the *Standard solution*

C_S = concentration of the respective methyl ester in the *Standard stock solution* (mg/mL)

V = volume of the *Standard stock solution* used to prepare the *Standard solution* (mL)

W = weight of Extract taken to prepare the *Sample solution* (mg)

M_{r1} = molecular weight of the relevant fatty acid

M_{r2} = molecular weight of the methyl ester of the relevant fatty acid

Acceptance criteria: 70.0%–95.0% for the sum of the percentages of all the fatty acids.

• CONTENT OF LONG-CHAIN ALCOHOLS AND STEROLS

Derivatizing solution A: Bis(trimethylsilyl)acetamide, trimethylsilylimidazole, and trimethylchlorosilane (3:3:2)

Derivatizing solution B: *Derivatizing solution A*, bis(trimethylsilyl)trifluoroacetamide, and pyridine (1:1:1)

Internal standard solution: 10 mg/mL of eicosanol and 5 mg/mL of cholesterol in chloroform

Standard stock solution: 0.75 mg/mL of USP

Hexacosanol RS and 1.4 mg/mL of USP β-Sitosterol RS in chloroform

Standard solution: Mix 5.0 mL of *Standard stock solution* with 1.0 mL of the *Internal standard solution*. Evaporate 0.75 mL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 1.0 mL of *Derivatizing solution B*, and allow to stand for NLT 15 min at room temperature.

Sample solution: Transfer 3.35 g of Extract into a 50-mL round-bottomed flask. Add 1.0 mL of *Internal standard solution*, and evaporate under vacuum at a temperature not exceeding 50°. Add 20 mL of a solution prepared by dissolving 130 g of potassium hydroxide in 200 mL of water in a 1000-mL volumetric flask, and dilute with methanol to volume. Attach a condenser, and reflux in a bath at 100° for 2 h. Quantitatively transfer this solution to a 25-mL volumetric flask, and dilute with water to volume. Transfer a 3-mL portion to a cartridge¹ containing diatomaceous earth capable of holding 3 mL of aqueous phase.

Absorb the solution into the column under vacuum for 20 min until the column is not cold. Elute the analytes from the column with 90 mL of methylene chloride, and evaporate the eluate to dryness. Dissolve the residue in 1.0 mL of *Derivatizing solution B*, and allow to stand for NLT 15 min at room temperature.

System suitability stock solution A: 2 mg/mL each of tetracosanol, octacosanol, USP Hexacosanol RS, and triacontanol in chloroform

System suitability solution A: Mix 5.0 mL of *System suitability stock solution A* with 1.0 mL of *Internal standard solution*. Evaporate 0.75 mL of this solution to dryness using a stream of nitrogen. Dissolve the residue

¹ A suitable cartridge is Extrelut NT3, or an equivalent cartridge.

in 1.0 mL of *Derivatizing solution B*, and allow to stand for NLT 15 min at room temperature.

System suitability stock solution B: 2 mg/mL each of campesterol, stigmasterol, and USP β -Sitosterol RS and 0.37 mg/mL of stigmastanol

System suitability solution B: Mix 5.0 mL of *System suitability stock solution B* with 1.0 mL of the *Internal standard solution*. Evaporate 0.75 mL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 1.0 mL of *Derivatizing solution B*, and allow to stand for NLT 15 min at room temperature.

Chromatographic system

(See *Chromatography* <621>), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.2-mm \times 25-m capillary; 0.33- μ m thickness of phase G1 coating

Temperature

Injector: 325°

Detector: 325°

Column: See *Table 5*.

Table 5

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
200	0	200	3
200	10	300	35

Carrier gas: Helium

Flow rate: 0.5 mL/min

Make up gas flow: 25 mL/min

Injection size: 1 μ L

Injection type: Split ratio, 1:40

System suitability

Samples: *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for tetracosanol, hexacosanol, octacosanol, and triacontanol are 0.89, 1.00, 1.15, and 1.36, respectively, *System suitability solution A*; and the relative retention times for cholesterol, campesterol, stigmasterol, β -sitosterol, and stigmastanol are 0.85, 0.92, 0.95, 1.00, and 1.01, respectively, *System suitability solution B*.]

Suitability requirements

Resolution: NLT 2 between β -sitosterol and stigmastanol peaks, *System suitability solution B*

Column efficiency: NLT 200,000 theoretical plates for the eicosanol peak, *System suitability solution A*; and NLT 150,000 theoretical plates for the cholesterol peak, *System suitability solution B*

Tailing factor: NMT 2.0 for each relevant peak, *System suitability solution A*; and NMT 2.0 for each relevant peak, *System suitability solution B*

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the signals corresponding to the relevant analytes by comparison with the chromatograms obtained with *System suitability solutions A* and *B*. Separately calculate the percentages of tetracosanol, hexacosanol, octacosanol, and triacontanol, respectively, in the portion of Extract taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times V) \times (1/W) \times 100$$

R_U = peak response ratio of the relevant long-chain alcohol to the internal standard from the *Sample solution*

R_S = peak response ratio of hexacosanol to the internal standard from the *Standard solution*

C_S = concentration of hexacosanol in the *Standard stock solution* (mg/mL)

V = volume of the *Standard stock solution* used to prepare the *Standard solution* (mL)

W = weight of the Extract taken to prepare the *Sample solution* (mg)

Calculate the total content of long-chain alcohols as a percentage by adding the individual percentages.

Separately calculate the percentages of campesterol, stigmasterol, β -sitosterol, and stigmastanol, respectively, in the portion of Extract taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times V) \times (1/W) \times 100$$

R_U = peak response ratio of the relevant sterol to the internal standard from the *Sample solution*

R_S = peak response ratio of β -sitosterol to the internal standard from the *Standard solution*

C_S = concentration of β -sitosterol in the *Standard stock solution* (mg/mL)

V = volume of the *Standard stock solution* used to prepare the *Standard solution* (mL)

W = weight of the Extract taken to prepare the *Sample solution* (mg)

Calculate the total content of sterols as a percentage by adding the individual percentages.

Acceptance criteria: 0.2%–0.5% of sterols; the lipophilic Extract contains 0.15%–0.35% of long-chain alcohols; and the hydroalcoholic Extract contains 0.01%–0.15% of long-chain alcohols

CONTAMINANTS

- **HEAVY METALS**, *Method II* <231>: NMT 40 μ g/g
- **BOTANICAL EXTRACTS**, *Pesticide Residues* <565>: Meets the requirements

SPECIFIC TESTS

- **ALCOHOL DETERMINATION**, *Method II* <611> (if present): NMT 1%
- **FATS AND FIXED OILS**, *Iodine Value* <401>: 40–50
- **FATS AND FIXED OILS**, *Saponification Value* <401>: 210–250
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* <401>: 1.8%–3.5%
- **WATER DETERMINATION**, *Method I* <921>: NMT 3% is found in the hydroalcoholic Extract.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Meets the requirements in *Botanical Extracts* <565>, *Packaging and Storage*
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of fatty acids and sterols and the ratio of the starting crude plant material to Extract. It meets the requirements in *Botanical Extracts*, <565> *Labeling*.

Saw Palmetto Capsules

DEFINITION

Saw Palmetto Capsules contain Saw Palmetto Extract. Capsules contain NLT 22.0% and NMT 34.0% of lauric acid in the labeled amount of Saw Palmetto Extract. The ratio of the concentrations of lauric acid to caprylic acid is NLT 8.5 and NMT 17.5. The ratio of the concentrations of lauric acid to myristic acid is NLT 2.2 and NMT 2.8.

IDENTIFICATION

- **A.** The retention times of the peaks for methyl caprate, methyl caproate, methyl caprylate, methyl laurate, methyl linoleate, methyl linolenate, methyl myristate, methyl oleate, methyl palmitate, methyl palmitoleate, and methyl stearate of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the test for *Content of Lauric Acid and the Ratios of the Concentrations of Lauric Acid to Caprylic Acid and Lauric Acid to Myristic Acid*.
- **B. PRESENCE OF STEROLS**

Derivatizing stock solution: *N,O*-bis(trimethylsilyl)-acetamide, trimethylsilylimidazole, and trimethylchlorosilane (3:3:2)

Derivatizing solution: *Derivatizing stock solution*, bis(trimethylsilyl)trifluoroacetamide, and pyridine (1:1:1)

Internal standard solution: 10 mg/mL of eicosanol and 5 mg/mL of cholesterol in chloroform

Standard stock solution: 0.75 mg/mL of USP Hexacosanol RS and 1.4 mg/mL of USP β -Sitosterol RS in chloroform

Standard solution: Mix 5.0 mL of *Standard stock solution* with 1.0 mL of the *Internal standard solution*. Evaporate 0.75 mL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 1.0 mL of *Derivatizing solution*, and allow to stand for NLT 15 min at room temperature.

System suitability stock solution A: 2 mg/mL each of tetracosanol, octacosanol, USP Hexacosanol RS, and triacontanol in chloroform

System suitability solution A: Mix 5.0 mL of *System suitability stock solution A* with 1.0 mL of *Internal standard solution*. Evaporate 0.75 mL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 1.0 mL of *Derivatizing solution*, and allow to stand for NLT 15 min at room temperature.

System suitability stock solution B: 2 mg/mL each of campesterol, stigmasterol, and USP β -Sitosterol RS, and 0.37 mg/mL of stigmasterol

System suitability solution B: Mix 5.0 mL of *System suitability stock solution B* with 1.0 mL of *Internal standard solution*. Evaporate 0.75 mL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 1.0 mL of *Derivatizing solution*, and allow to stand for NLT 15 min at room temperature.

β -Cholesterol solution: β -cholesterol in chloroform (1 in 100)

Sample solution

Sample: A number of Capsules, equivalent to 10 g of Saw Palmetto Extract

Open the Capsules, and transfer the shells and contents to a suitable container.

Transfer 5 g of the *Sample* to a 250-mL round-bottom flask, and evaporate in vacuum at a temperature of NMT 50°. Add 50 mL of a solution prepared by dissolving 130 mg/mL of potassium hydroxide in methanol and water (4:1). Attach a condenser, and reflux in a bath at 100° until a clear solution is obtained. Reflux for an additional 10 min, and cool by adding 50 mL of water through the condenser. Transfer to a separation funnel, rinsing the flask with a total of 50 mL of water in small portions. Extract with 80 mL of ether, shaking for 30 s, and repeat twice. [NOTE—If an emulsion forms, it can be eliminated by adding small quantities

of methanol.] Transfer the combined ether layers to a separation funnel, and wash with successive portions of 50 mL of water until a neutral washing is obtained. [NOTE—If an emulsion forms, it can be eliminated by adding small quantities of methanol.] Pass the ether extract through filter paper containing anhydrous sodium sulfate, wash the filter with 30 mL of ether, and evaporate to dryness in vacuum. Dissolve the residue in 2.0 mL of chloroform. Extract the sterols using the following chromatographic system.

Chromatographic extraction system

Mode:

Absorbent: Chromatographic plate coated with 0.25-mm silica gel having an application zone that was previously dipped under 3 cm of a solution prepared by dissolving 13 mg/mL of potassium hydroxide in methanol and water (49:1)

Developing solvent system: Hexanes and ether (7:3)

Application volumes: 200 μ L of chloroform solution containing Capsule residue and 20 μ L of β -Cholesterol solution

After the spots have been applied, allow the plate to dry, and heat it to 100° for 1 h before use. The plate can be stored in a desiccator containing calcium chloride until the time of use. Develop the plates until the solvent front has moved 17–19 cm. Keep the chamber temperature between 15° and 20°. Dry the plate in a current of warm air, then spray with an alkaline solution of 2,7-dichlorofluorescein in alcohol (0.2 in 100). Observe the plate under 366-nm wavelength light, and identify the bands corresponding to the sterols by referring to the β -cholesterol spot. Scrape off these bands and transfer them to a test tube. Add 10 mL of warm chloroform, and shake for 2 min with the aid of several glass beads. Filter the chloroform solution, wash the filter with chloroform, and evaporate the combined filtrate and washings to dryness in vacuum. Dissolve the residue with some drops of anhydrous acetone, and evaporate in vacuum. Dry the residue in an oven at 105° for 15 min. Dissolve the residue in 0.2 mL of *Derivatizing solution*. Use this resulting solution as the *Sample solution* for GC analysis.

Chromatographic system

System suitability

Samples: *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for tetracosanol, octacosanol, hexacosanol, and triacontanol are 0.89, 1.00, 1.15, and 1.36, respectively, *System suitability solution A*; and the relative retention times for cholest-

terol, campesterol, stigmasterol, β -sitosterol, and stigmasterol are 0.85, 0.92, 0.95, 1.00, and 1.01, respectively, *System suitability solution B*.]

Suitability requirements

Resolution: NLT 2 between β -sitosterol and stigmasterol, *System suitability solution B*

Column efficiency: NLT 200,000 theoretical plates for the eicosanol peak, *System suitability solution A*; and NLT 150,000 theoretical plates for the cholesterol peak, *System suitability solution B*

Tailing factor: NMT 2.0 for each relevant peak, *System suitability solution A*; and NMT 2.0 for each relevant peak, *System suitability solution B*

Analysis

Samples: *Standard solution* and *Sample solution*
Identify the signals corresponding to the relevant analytes by comparison with the chromatograms obtained with *System suitability solutions A* and *B*.

Acceptance criteria: The *Sample solution* exhibits peaks for campesterol, β -sitosterol, and stigmasterol, identified by their retention times relative to the β -sitosterol peak in the *Standard solution*.

STRENGTH

• CONTENT OF LAURIC ACID AND THE RATIOS OF THE CONCENTRATIONS OF LAURIC ACID TO CAPRYLIC ACID AND LAURIC ACID TO MYRISTIC ACID

Internal standard solution: 12 mg/mL of nonadecane in hexanes

Standard stock solution: Dissolve quantities of USP Methyl Laurate RS, USP Methyl Oleate RS, USP Methyl Myristate RS, USP Methyl Palmitate RS, USP Methyl Linoleate RS, USP Methyl Caproate RS, USP Methyl Caprylate RS, USP Methyl Caprate RS, USP Methyl Palmitoleate RS, USP Methyl Stearate RS, and USP Methyl Linolenate RS in hexanes to obtain concentration of each methyl ester as given in the table below.

Methyl Ester	Concentration (mg/mL)
Methyl laurate	5
Methyl oleate	5
Methyl myristate	2
Methyl palmitate	2
Methyl linoleate	1
Methyl caproate	0.4
Methyl caprylate	0.4
Methyl caprate	0.4
Methyl palmitoleate	0.4
Methyl stearate	0.4
Methyl linolenate	0.4

Standard solution: Add 1.0 mL of *Internal standard solution* to 5.0 mL of the *Standard stock solution*.

Sample solution: Take a number of Capsules, equivalent to 10 g of Extract, open the Capsules, and transfer the shells and contents to a suitable container. Transfer 100 mg to a pressure-proof screw-capped vial, and add 3.0 mL of a solution of sulfuric acid in methanol (5 in 100). Heat in an oil bath at 100° for 2 h, shaking from time to time. Allow to cool, and add 1.0 mL of *Internal standard solution*, 10.0 mL of water, 1 g of sodium chloride, and 5 mL of hexanes. Shake well, and allow the layers to separate completely. Use the hexanes layer. [NOTE—Store this solution in a refrigerator until use.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm \times 30-m fused silica capillary, coated with a 0.25- μ m film of phase G16

Temperature

Detector: 300°

Injector: 250°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
120	0	120	3
120	50	220	12

Carrier gas: Helium

Flow rate: 1 mL/min

Injection size: 1 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methyl caproate, methyl caprylate, methyl caprate, methyl laurate, nonadecane (internal standard), methyl myristate, methyl palmitate, methyl palmitoleate, methyl stearate, methyl oleate, methyl linoleate, and methyl linolenate are about 0.39, 0.56, 0.76, 0.94, 1.0, 1.1, 1.3, 1.35, 1.65, 1.7, 1.8, and 2.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the methyl stearate and methyl oleate peaks

Tailing factor: NMT 2.0 for each of the methyl ester peaks

Relative standard deviation: NMT 5.0% for each of the methyl ester peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of lauric acid, myristic acid, and caprylic acid in the labeled amount of Saw Palmetto Extract in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times V/W) \times (M_{r1}/M_{r2}) \times A_W/L_E \times 100$$

R_U = ratio of the response of the relevant methyl ester peak and the internal standard peak from the *Sample solution*

R_S = ratio of the response of the relevant methyl ester peak and the internal standard peak from the *Standard solution*

C_S = concentration of the respective methyl ester in the *Standard stock solution* (mg/mL)

V = volume of the *Standard stock solution* taken to prepare the *Standard solution* (5.0 mL)

W = weight of sample used to prepare the *Sample solution* (mg)

M_{r1} = molecular weight of the relevant fatty acid

M_{r2} = molecular weight of the methyl ester of the relevant fatty acid

A_W = average weight of the Capsule contents (mg/Capsule)

L_E = labeled amount of Saw Palmetto Extract per Capsule (mg/Capsule)

Using these percentages, calculate the individual ratios of the concentration of lauric acid to caprylic acid and of lauric acid to myristic acid in the portion of Capsules taken.

Acceptance criteria: 22.0%–34.0% of lauric acid in the labeled amount of Saw Palmetto Extract. The ratio of lauric acid to caprylic acid is 8.5–17.5. The ratio of lauric acid to myristic acid is 2.2–2.8.

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Rupture Test for Soft Shell Capsules*

• **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** (2021): The total bacterial count does not exceed 10^4 cfu/g, the total combined molds and yeasts count does not exceed 1000 cfu/g, the coliform count does not exceed 100 cfu/g, and the count for enterobacteria does not exceed 100 cfu/g.
- **MICROBIAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Capsules meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the name of article from which the Capsules were prepared. Label it to indicate the amount of Extract in mg/Capsule.
- **USP REFERENCE STANDARDS** (11)
 - USP Hexacosanol RS
 - USP Methyl Caprate RS
 - USP Methyl Caproate RS
 - USP Methyl Caprylate RS
 - USP Methyl Laurate RS

 - USP Methyl Linolenate RS
 - USP Methyl Myristate RS
 - USP Methyl Oleate RS
 - USP Methyl Palmitate RS
 - USP Methyl Palmitoleate RS
 - USP Methyl Stearate RS
 - USP β -Sitosterol RS

Schizochytrium Oil

DEFINITION

Schizochytrium Oil is obtained by fermentation and extraction of algae of the genus *Schizochytrium* and contains NLT 30.0% (w/w) of docosahexaenoic acid (DHA, $C_{22}H_{32}O_2$) ($C_{22:6}$ n-3), as the main polyunsaturated fatty acid. Suitable antioxidants in appropriate concentration may be added.

IDENTIFICATION

- **LONG CHAIN UNSATURATED FATTY ACID PROFILE:** Proceed as directed under *Composition, Content of DHA*.

Analysis

Samples: *Standard Solution 2* and *Test Solution 1*
Calculate the area percentage for each fatty acid as methyl ester in *Test Solution 1*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual fatty acid as methyl ester

r_T = sum of the responses of all the peaks, except the solvent and butylated hydroxytoluene peaks

Acceptance criteria: The retention times of the peaks of the docosahexaenoic acid methyl ester and the eicosapentanoic acid methyl ester of *Test Solution 1* correspond to those of *Standard Solution 2*, as obtained in the test for *Content of EPA and DHA*. The area percentage for the methyl esters of the fatty acids from the chromatogram of *Test Solution 1* in the test for *Content of EPA and DHA* meet the requirements for each fatty acid shown in the table below.

Fatty Acid	Relative Retention Time	Shorthand Notation	Lower Limit (Area %)	Upper Limit (Area %)
Dihomo-gamma-linolenic acid	0.71	20:3 n-6	1.7	2.8
Arachidonic acid	0.73	20:4 n-6	0.6	1.3
Eicosapentanoic acid (EPA)	0.79	20:5 n-3	1.3	3.9
Docosapentanoic acid (DPA n-6)	0.94	22:5 n-6	10.5	16.5
Docosahexanoic acid (DHA)	1.00	22:6 n-3	30.0	40.0

COMPOSITION• **CONTENT OF DHA**

Analysis: Proceed as directed under *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.

Acceptance criteria: NLT 30.0% (w/w) docosahexaenoic acid (DHA)

IMPURITIES**Inorganic Impurities**• **LIMIT OF ARSENIC**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal to a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 μ L provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed under *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow

container. Equip the microwave oven with an exhaust tube to ventilate fumes. [CAUTION—Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg of Schizochytrium Oil, weighed to the nearest 0.1 mg, to a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests to 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Schizochytrium Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above
W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the

solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed under *Heavy Metals* (231), to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Schizochytrium Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above
W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• LIMIT OF CADMIUM

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before makeup to final volume, dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of cadmium in the portion of Schizochytrium Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• LIMIT OF MERCURY

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*, combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution* (see *Mercury* <261>, *Method IIa and Method IIb, Reagents*).

Analysis: Proceed as directed for *Mercury* <261>, *Method IIa and Method IIb*, except use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Acceptance criteria: NMT 0.1 µg/g

SPECIFIC TESTS

- **FATS AND FIXED OILS, Anisidine Value** <401>: NMT 20.0
- **FATS AND FIXED OILS, Free Fatty Acids** <401>: The free fatty acids in 10 g require NMT 1.42 mL of 0.1 N sodium hydroxide for neutralization.
- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 5.0
- **FATS AND FIXED OILS, Total Oxidation Value (TOTOX)** <401>: NMT 26, calculated:

$$\text{Result} = (2 \times \text{PV}) + \text{AV}$$

PV = peroxide value

AV = anisidine value

- **FATS AND FIXED OILS, Unsaponifiable Matter** <401>: NMT 4.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

- **LABELING:** The label states the content of docosahexaenoic acid in mg/g. It also states the name and concentration of any added antioxidant.
- **USP REFERENCE STANDARDS** <11>
 - USP Docosahexaenoic Acid Ethyl Ester RS
 - USP Eicosapentaenoic Acid Ethyl Ester RS
 - USP Methyl Tricosanoate RS

Schizochytrium Oil Capsules

DEFINITION

Schizochytrium Oil Capsules are prepared from Schizochytrium Oil and contain NLT 95.0% and NMT 105.0% of the labeled amount of docosahexaenoic acid (DHA; C₂₂H₃₂O₂) (C22:6 n-3).

IDENTIFICATION

- **LONG CHAIN UNSATURATED FATTY ACID PROFILE:** Proceed as directed under *Strength, Content of DHA*.

Analysis

Samples: *Standard Solution 2* and *Test Solution 1*
Calculate the area percentage for each fatty acid as methyl ester in *Test Solution 1*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual fatty acid as methyl ester

r_T = sum of the responses of all the peaks, except the solvent and butylated hydroxytoluene peaks

Acceptance criteria: The retention times of the peaks of the docosahexaenoic acid methyl ester and the eicosapentaenoic acid methyl ester of *Test Solution 1* correspond to those of *Standard Solution 2*, as obtained in the test for *Content of EPA and DHA*. The area percentage for the methyl esters of the fatty acids from the chromatogram of *Test Solution 1* in the test for *Content of EPA and DHA* meet the requirements for each fatty acid shown in the table below.

Fatty Acid	Relative Retention Time	Shorthand Notation	Lower Limit (Area %)	Upper Limit (Area %)
Dihomo-gamma-linolenic acid	0.71	20:3 n-6	1.7	2.8
Arachidonic acid	0.73	20:4 n-6	0.6	1.3
Eicosapentaenoic acid (EPA)	0.79	20:5 n-3	1.3	3.9
Docosapentaenoic acid (DPA n-6)	0.94	22:5 n-6	10.5	16.5
Docosahexaenoic acid (DHA)	1.00	22:6 n-3	30.0	40.0

STRENGTH

• CONTENT OF DHA

Test Solution 1 and Test Solution 2: Weigh NLT 10 Capsules in a tared weighing bottle. With a sharp blade or other appropriate means, carefully open the Capsules, without loss of the shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied

Capsules by washing with several small portions of isooctane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the isooctane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average fill weight (AFW) of schizochytrium oil per Capsule. Proceed with the content of Capsules as directed in the *Analysis*.

Analysis: Proceed as directed in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile, Content of EPA and DHA*.

Calculate the percentage of the labeled amount of docosahexaenoic acid (DHA) in the Capsules taken:

$$\text{Result} = R \times \text{AFW}/L$$

R = percentage of DHA in the portion of oil taken from the Capsules
 AFW = average fill weight of the Capsules taken (mg)
 L = the labeled amount of DHA (mg/Capsule)
Acceptance criteria: NLT 95.0% and NMT 105.0% of the labeled amount of DHA

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** (2040): Meet the requirements of the *Rupture Test for Soft Shell Capsules*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** (2091): Meet the requirements

IMPURITIES

Inorganic Impurities

• LIMIT OF ARSENIC

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 μL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in the test for *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 $\mu\text{g}/\text{mL}$ of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 $\mu\text{g}/\text{mL}$ of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytetrafluoroethylene liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow

container. Equip the microwave oven with an exhaust tube to ventilate fumes. [**CAUTION**—Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg of schizochytrium oil from Capsules, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 μL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 μL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in $\mu\text{g}/\text{mL}$, and calculate the regression line best fitting the points. Determine the concentration, C , in $\mu\text{g}/\text{mL}$, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above
 W = weight of Capsule content taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 $\mu\text{g}/\text{g}$

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: 1 g of ultrapure magnesium nitrate in a Teflon beaker. Add 40 mL of water and 1 mL of nitric

acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 μ L provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in the test for *Heavy Metals* <231>, to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 μ g/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 μ L) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 μ L of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in μ g/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in μ g/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Capsules taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of Capsule content taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 μ g/g

• LIMIT OF CADMIUM

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytetrafluoroethylene, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytetrafluoroethylene, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 μ L provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 μ g/mL of cadmium. [NOTE—Before makeup to final volume, dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 μ g/mL of cadmium.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 μ L) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 μ L of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in μ g/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in μ g/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of cadmium in the Capsules taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of Capsule content taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 μ g/g

• LIMIT OF MERCURY

Proceed as directed for *Mercury* <261>, *Method IIa* and *Method IIb*, except use a *Standard Mercury Solution* having the equivalent of 0.1 μ g/mL of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*, combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution*.

Acceptance criteria: NMT 0.1 μ g/g

SPECIFIC TESTS

- **FATS AND FIXED OILS, Anisidine Value <401>:** NMT 20.0, determined on the contents of the Capsules
- **FATS AND FIXED OILS, Free Fatty Acids <401>:** The free fatty acids in 10 g require for neutralization NMT 1.42 mL of 0.1 N sodium hydroxide.
- **FATS AND FIXED OILS, Peroxide Value <401>:** NMT 5.0, determined on the contents of the Capsules
- **FATS AND FIXED OILS, Total Oxidation Value (TOTOX) <401>:** NMT 26 (determined on the contents of the Capsules), calculated as:

$$\text{Result} = (2 \times \text{PV}) + \text{AV}$$

PV = peroxide value

AV = anisidine value

- **FATS AND FIXED OILS, Unsaponifiable Matter <401>:** NMT 4.5%, determined on the contents of the Capsules

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

- **LABELING:** The label states the content of docosahexaenoic acid in mg/Capsule. It also states the name and concentration of any added antioxidant.
- **USP REFERENCE STANDARDS** (11)
USP Docosahexaenoic Acid Ethyl Ester RS
USP Eicosapentaenoic Acid Ethyl Ester RS
USP Methyl Tricosanoate RS

Selenomethionine

$C_5H_{11}NO_2Se$ 196.11
Butanoic acid, 2-amino-4-(methylseleno)-, (S)-;
(S)-2-Amino-4-(methylselenyl)butyric acid [1464-42-2].

DEFINITION

Selenomethionine contains NLT 97.0% and NMT 103.0% of selenomethionine ($C_5H_{11}NO_2Se$) and contains NLT 39.0% and NMT 41.0% of selenium (Se), calculated on the as-is basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

ASSAY

• PROCEDURE

Mobile phase: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.75 ± 0.25 .

System suitability solution: 0.16 mg/mL of USP Selenomethionine RS and 0.8 mg/mL of USP L-Methionine RS in *Mobile phase*

Standard solution: 0.16 mg/mL of USP Selenomethionine RS in *Mobile phase*

Sample solution: 0.16 mg/mL of Selenomethionine in *Mobile phase* with sonication. Pass through a membrane filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; packing L1 with polar end-capping

Flow rate: 1 mL/min

Injection size: 20 μ L

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for methionine and selenomethionine are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between methionine and selenomethionine

Tailing factor: NMT 2.0 for the selenomethionine peak

Relative standard deviation: NMT 2.0% for the selenomethionine peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of selenomethionine ($C_5H_{11}NO_2Se$) in the portion of Selenomethionine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Selenomethionine RS in the *Standard solution* (mg/mL)

C_U = concentration of Selenomethionine in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the as-is basis

IMPURITIES

- **HEAVY METALS, Method I** (231): NMT 20 ppm

• LIMIT OF SODIUM

Standard stock solution: 10 μ g/mL of sodium from sodium chloride, previously dried at 105° for 2 h

Standard solutions: 0.2, 0.5, and 1.0 μ g/mL of sodium. Pipet 2.0, 5.0, and 10.0 mL of *Standard stock solution* into separate 100-mL volumetric flasks. To each flask add 2.0 mL of potassium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Sample solution: Transfer 100 mg of Selenomethionine to a 100-mL volumetric flask, add 2.0 mL of potassium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 589 nm

Lamp: Sodium hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions. Plot the absorbances of the *Standard solutions* versus their concentrations (μ g/mL of sodium), and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration of sodium, C_{Na} (μ g/mL), in the *Sample solution*.

Calculate the percentage of sodium in the portion of Selenomethionine taken:

$$\text{Result} = (C_{Na}/C_{SA}) \times F \times 100$$

C_{Na} = concentration of sodium in the *Sample solution* (μ g/mL), determined from the regression line

C_{SA} = concentration of Selenomethionine in the *Sample solution* (mg/mL)

F = conversion factor, 0.001 mg/ μ g

Acceptance criteria: NMT 0.1%

• CHROMATOGRAPHIC PURITY

Standard solution A: Transfer 50 mg of USP Selenomethionine RS to a 10-mL volumetric flask, add 2 mL of water, warm to dissolve if necessary, and dilute with methanol to volume.

Standard solution B: Transfer 1.0 mL of *Standard solution A* to a 100-mL volumetric flask, and dilute with methanol to volume.

Sample solution: Transfer 50 mg of Selenomethionine to a 10-mL volumetric flask, add 2 mL of water, warm to dissolve if necessary, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: TLC

Absorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent: Butanol, glacial acetic acid, and water (4:1:1)

Spray reagent: 2 mg/mL of ninhydrin in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*. Allow the spots to dry, and develop the chromatogram in the *Developing solvent* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate

by spraying with *Spray reagent* and drying it at 110° for 10 min.

Acceptance criteria: NMT 1.0%. The R_f value of the principal spot of the *Sample solution* corresponds to that of *Standard solution A*; and no spot, other than the principal spot of the *Sample solution*, is larger or more intense than the principal spot of *Standard solution B*.

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation (781S)**
Sample solution: 10 mg/mL in 1 N hydrochloric acid
Acceptance criteria: +17.0° to +19.5°
- **CONTENT OF SELENIUM**
[CAUTION—Selenium is toxic; handle it with care.]
Standard stock solution: Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume. This solution contains 1000 µg/mL of selenium.
Standard solutions: 20, 50, and 100 µg/mL of selenium. Pipet 2.0, 5.0, and 10.0 mL of *Standard stock solution* into separate 100-mL volumetric flasks. Dilute the contents of each flask with water to volume.
Sample solution: 0.125 mg/mL of Selenomethionine in water
Instrumental conditions
 (See *Spectrophotometry and Light-Scattering* (851).)
Mode: Atomic absorption spectrophotometry
Analytical wavelength: 196 nm
Lamp: Selenium hollow-cathode
Flame: Air-acetylene
Blank: Water
Analysis
Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions. Plot the absorbances of the *Standard solutions* versus their concentrations (µg/mL of selenium), and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration of selenium, C_{se} (µg/mL), in the *Sample solution*. Calculate the percentage of selenium in the portion of Selenomethionine taken:

$$\text{Result} = (C_{se}/C_{SA}) \times F \times 100$$

- C_{se} = concentration of selenium in the *Sample solution* (µg/mL), determined from the regression line
 C_{SA} = concentration of Selenomethionine in the *Sample solution* (mg/mL)
 F = conversion factor, 0.001 mg/µg
Acceptance criteria: 39.0%–41.0% on the as-is basis

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
 USP L-Methionine RS
 USP Selenomethionine RS

Siberian Ginseng—see *Eleuthero*

Slippery Elm—see *Elm General Monographs*

Sodium Ascorbate—see *Sodium Ascorbate General Monographs*

Powdered Soy Isoflavones Extract

DEFINITION

Powdered Soy Isoflavones Extract is prepared from the seeds of *Glycine max* Merr. (Fam. Fabaceae) by extraction with water or hydroalcoholic mixtures. It contains NLT 90.0% and NMT 110.0% of the labeled amount of isoflavones, calculated on the dried basis as the sum of daidzin, glycitin, genistin, and one or more of the following isoflavones: malonyl daidzin, malonyl glycitin, malonyl genistin, acetyl daidzin, acetyl glycitin, acetyl genistin, daidzein, glycitein, and genistein.

IDENTIFICATION

- **A. HPLC IDENTIFICATION TEST**
Analysis: Proceed as directed in the test for *Content of Isoflavones*.
Acceptance criteria: The retention times of the daidzin, glycitin, and genistin peaks from the *Sample solution* correspond to those of *Standard solutions A–E*.

COMPOSITION

- **CONTENT OF ISOFLAVONES**
Diluent: Acetonitrile and water (2:3)
Internal standard solution: 2.0 mg/mL USP Apigenin RS in dimethyl sulfoxide. [NOTE—This solution is stable for 6 months when stored in a tightly closed, light-resistant glass container at room temperature.]
System suitability solution 1: Transfer 1 g of USP Defatted Powdered Soy RS to a centrifuge tube, fitted with PTFE or polyethylene-lined screw caps. Add the following in exact volumes: 0.5 mL of *Internal standard solution*, 10 mL of acetonitrile (swirl to disperse), and 6.0 mL of water. Cap, shake on an orbital or wrist-action shaker for 60 min, add 8.5 mL of water, and centrifuge. Pass a portion of the supernatant through a hydrophilic propylene or PVDF membrane having a 0.45-µm or finer pore size, discarding the first 5 mL of filtrate.
System suitability solution 2: Heat 1 g of USP Defatted Powdered Soy RS in a shallow porcelain dish at 120° for 120 min, and transfer to a centrifuge tube, fitted with PTFE or polyethylene-lined screw caps. Add the following in exact volumes: 0.5 mL of *Internal standard solution*, 10 mL of acetonitrile (swirl to disperse), and 6.0 mL of water. Cap, shake on an orbital or wrist-action shaker for 60 min, add 8.5 mL of water, and centrifuge. Pass a portion of the supernatant through a hydrophilic propylene or PVDF membrane having a 0.45-µm or finer pore size, discarding the first 5 mL of filtrate.
 [NOTE—*Standard stock solution* and *Standard solutions A–E* are stable for 2 months when stored in a tightly closed, light-resistant glass container at room temperature.]
Standard stock solution: Contains the following in dimethyl sulfoxide: 2.0 mg/mL of USP Daidzin RS, 0.5 mg/mL of USP Glycitin RS, 2.0 mg/mL of USP Genistin RS, 0.2 mg/mL of USP Daidzein RS, 0.2 mg/mL of USP Glycitein RS, and 0.2 mg/mL of USP Genistein RS
Standard solution A: Add 0.5 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.
Standard solution B: Add 1.0 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution C: Add 1.5 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution D: Add 2.0 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution E: Add 2.5 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Sample solution: Transfer a quantity of Powdered Soy Isoflavones Extract, equivalent to NMT 5 mg of isoflavones, to a 30-mL glass centrifuge tube, fitted with a PTFE or polyethylene-lined screw cap. Add the following in exact volumes: 0.5 mL of *Internal standard solution*, 10 mL of acetonitrile (swirl to disperse), and 6.0 mL of water. Cap, shake on an orbital or wrist-action shaker for 60 min, add 8.5 mL of water, and centrifuge. Pass a portion of the supernatant through a hydrophilic propylene or PVDF membrane having a 0.45- μ m or finer pore size, discarding the first 5 mL of filtrate. [NOTE—Do not use nylon filters. Analyze samples containing significant amounts of acetyl and/or malonyl isoflavones within 4 h of preparation.]

Solution A: 0.05% phosphoric acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
60	70	30
60.5	10	90
63.5	10	90
64	90	10
74	90	10

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 3.0-mm \times 25-cm; 5- μ m packing L1

Column temperature: 40°

Flow rate: 0.65 mL/min

Injection size: 5 μ L

[NOTE—*System suitability 1* and *System suitability 2* must both be met.]

System suitability 1

Sample: *Standard solution C*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution C* is similar to the reference chromatogram provided with the lot of USP reference standard being used for the isoflavones mentioned.

Tailing factor: NLT 0.8 and NMT 1.2 for the daidzin peak

Relative standard deviation: NMT 2.0% for the genistin peak

System suitability 2

Samples: *System suitability solution 1* and *System suitability solution 2*

Suitability requirements

Chromatogram similarity: The chromatograms from *System suitability solution 1* and *System suitability solution 2* are similar to those provided with the lot of USP Defatted Powdered Soy RS being used.

Resolution: NLT 1.0 between the acetyl glycitin and malonyl genistin peaks, and NLT 2.0 between any other consecutive pair of isoflavone peaks

Analysis

Samples: *Standard solutions A–E* and *Sample solution*
Measure the peak areas of the analytes and the internal standard. Determine the ratio of the peak areas of each analyte to the internal standard peak area. Plot the ratios of the relevant peak responses versus the concentrations, in mg/mL, of each analyte obtained from the *Standard solutions A–E*, and determine the regression line by least-squares analysis. The correlation coefficient for each of the regression lines is NLT 0.999. From the graphs so obtained, determine the concentration, *C*, in mg/mL, of the relevant analyte in the *Sample solution*. Separately calculate the percentages of daidzin, glycitin, and genistin, and of daidzein, glycitein, and genistein, if present, in the portion of Powdered Soy Isoflavones Extract taken:

$$\text{Result} = (C/W) \times V \times 100$$

C = concentration of each isoflavone as determined above, for the *Sample solution* (mg/mL)

W = weight of Powdered Soy Isoflavones Extract taken to prepare the *Sample solution* (mg)

V = final solution volume of the *Sample solution* (mL)

Identify the peaks of malonyl daidzin, malonyl glycitin, acetyl daidzin, acetyl glycitin, malonyl genistin, and acetyl genistin by comparison with the reference chromatograms provided with USP Defatted Powdered Soy RS and by the difference in peak abundance between *System suitability solution 1* and *System suitability solution 2*. [NOTE—Malonyl derivatives are converted into acetyl derivatives by heat. Malonyl derivatives are more abundant in *System suitability solution 1* and acetyl derivatives are more abundant in *System suitability solution 2*.] From the graphs obtained for daidzin, glycitin, and genistin, determine the corresponding concentration, *C*, in mg/mL, of the malonyl and acetyl derivatives, if present, in the *Sample solution*.

Separately calculate the percentages of malonyl daidzin, acetyl daidzin, malonyl glycitin, acetyl glycitin, malonyl genistin, and acetyl genistin in the portion of Powdered Soy Isoflavones Extract taken:

$$\text{Result} = (C/W) \times V \times F \times 100$$

C = concentration of each isoflavone as determined above, for the *Sample solution* (mg/mL)

W = weight of Powdered Soy Isoflavones Extract taken to prepare the *Sample solution* (mg)

V = final solution volume of the *Sample solution* (mL)

F = conversion factor: malonyl daidzin, 1.207; acetyl daidzin, 1.101; malonyl glycitin, 1.193; acetyl glycitin, 1.094; malonyl genistin, 1.199; and acetyl genistin, 1.097

Calculate the percentage of isoflavones in the portion of the Powdered Soy Isoflavones Extract taken (*P*) by adding the percentages calculated for all analytes present.

Calculate the percentage of the labeled amount of isoflavones in the portion of the Powdered Soy Isoflavones Extract taken:

$$\text{Result} = (P/L) \times 100$$

P = sum of the individual percentages of each isoflavone in the Powdered Soy Isoflavones Extract taken, as calculated above (%)

L = labeled amount of isoflavones in the Powdered Soy Isoflavones Extract (%)

Acceptance criteria: 90.0%–110.0% on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g
- **ARTICLES OF BOTANICAL ORIGIN**, *Test for Aflatoxins* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count is NMT 10⁴ cfu/g, and the total combined molds and yeasts count is NMT 10³ cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry 1 g at 130° for 2 h: it loses NMT 7.0% of its weight.
- **OTHER REQUIREMENTS**: It meets the requirements for *Residual Solvents* and *Pesticide Residues* in *Botanical Extracts* (565).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **LABELING**: The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of isoflavones. It meets other labeling requirements in *Botanical Extracts* (565).
- **USP REFERENCE STANDARDS** (11)

Soy Isoflavones Capsules

DEFINITION

Soy Isoflavones Capsules contain Powdered Soy Isoflavones Extract. Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of Extract, represented by the sum of the content of the isoflavones daidzin, glycitin, genistin, and one or more of the following isoflavones: malonyl daidzin, malonyl glycitin, malonyl genistin, acetyl daidzin, acetyl glycitin, acetyl genistin, daidzein, glycitein, and genistein.

IDENTIFICATION

- The retention times of the daidzin, glycitin, and genistin peaks in the chromatogram of the *Sample solution* correspond to those of *Standard solutions A–E*, as obtained in the test for *Content of Isoflavones*.

STRENGTH

• CONTENT OF ISOFLAVONES

Diluent: Acetonitrile and water (2:3)

Internal standard solution: 2.0 mg/mL of USP Apigenin RS in dimethyl sulfoxide. [NOTE—This solution is stable for 6 months when stored in a tightly closed, light-resistant glass container at room temperature.]

Malonyl/Acetyl isoflavones retention times check solution 1: Heat 1 g of USP Defatted Powdered Soy RS in a shallow porcelain dish at 120° for 120 min, and transfer to a centrifuge tube, fitted with PTFE or polyethylene-lined screw cap. Add the following in exact volumes: 0.5 mL of *Internal standard solution*, 10 mL of acetonitrile (swirl to disperse), and 6.0 mL of water. Cap, shake on an orbital or wrist-action shaker for 60 min, add 8.5 mL of water, mix, and centrifuge. Pass a portion of the supernatant through a hydrophilic pro-

pylene or PVDF membrane of 0.45-µm or finer pore size, discarding the first 5 mL of filtrate.

Malonyl/Acetyl isoflavones retention times check solution 2: Transfer 1 g of USP Defatted Powdered Soy RS to a centrifuge tube, fitted with PTFE or polyethylene-lined screw cap. Add the following in exact volumes: 0.5 mL of *Internal standard solution*, 10 mL of acetonitrile (swirl to disperse), and 6.0 mL of water. Cap, shake on an orbital or wrist-action shaker for 60 min, add 8.5 mL of water, mix, and centrifuge. Pass a portion of the supernatant through a hydrophilic propylene or PVDF membrane of 0.45-µm or finer pore size, discarding the first 5 mL of filtrate.

[NOTE—All *Standard solutions* and *Standard stock solutions* are stable for 2 months when stored in a tightly closed, light-resistant glass container at room temperature.]

Standard stock solution: Contains the following in dimethyl sulfoxide: 2.0 mg/mL of USP Daidzin RS, 0.5 mg/mL of USP Glycitin RS, and 2.0 mg/mL of USP Genistin RS, 0.2 mg/mL of USP Daidzein RS, 0.2 mg/mL of USP Glycitein RS, and 0.2 mg/mL of USP Genistein RS

Standard solution A: Add 0.5 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution B: Add 1.0 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution C: Add 1.5 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution D: Add 2.0 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution E: Add 2.5 mL of *Standard stock solution* and 0.5 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Sample solution

Hard-gelatin Capsules: Weigh and finely powder the content of NLT 20 Capsules. Transfer an accurately weighed quantity of the powder, equivalent to NMT 5 mg of isoflavones, to a suitable glass centrifuge tube, fitted with PTFE or polyethylene-lined screw cap.

Soft-gelatin Capsules: Weigh and homogenize NLT 20 Capsules. Transfer an accurately weighed quantity of the mixture, equivalent to NMT 5 mg of isoflavones, to a suitable glass centrifuge tube, fitted with PTFE or polyethylene-lined screw cap.

Add the following in exact volumes to the centrifuge tube: 0.5 mL of *Internal standard solution*, 10 mL of acetonitrile (swirl to disperse), and 6.0 mL of water. Cap, shake on an orbital or wrist-action shaker for 60 min, add 8.5 mL of water, mix, and centrifuge. Pass a portion of the supernatant through a hydrophilic propylene or PVDF membrane of 0.45-µm or finer pore size, discarding the first 5 mL of filtrate. [NOTE—Do not use nylon filters. Analyze samples containing significant amounts of acetyl and/or malonyl isoflavones within 4 h of preparation.]

Identify the peaks of daidzin, glycitin, genistin, daidzein, glycitein, and genistein in the chromatograms of *Standard solutions A–E* by comparison with the Reference Standard Chromatogram provided with the appropriate USP Reference Standard used. Measure the peak areas of the analytes and the internal standard peaks. Determine the ratio of the peak areas of each analyte to the internal standard peak areas. Plot the ratios of the relevant peak responses versus the concentrations, in mg/mL, of each analyte obtained from *Standard solutions A–E*, and determine the regression line by least-squares analysis. The correlation coefficient for each of the regression lines is NLT 0.999. From the graphs obtained, determine the concentration, C_o , in mg/mL, of daidzin, glycitin, and genistin, in addition to daidzein, glycitein, and genistein, if present, in the *Sample solution*. Identify the peaks of malonyl daidzin, malonyl glycitin, acetyl daidzin, acetyl glycitin, malonyl genistin, and acetyl genistin in the chromatograms of the *Malonyl/Acetyl isoflavones retention times check solutions* by comparison with the Reference Chromatograms provided with the USP Defatted Powdered Soy RS. From the graphs obtained for daidzin, glycitin and genistin, determine the concentration, C_o , in mg/mL, of the corresponding malonyl and acetyl derivatives, if present, in the *Sample solution*:

$$\text{Result} = C_o \times F$$

C_o = concentration obtained from the relevant graph (mg/mL)

F = conversion factor for each analyte (1.207 for malonyl daidzin, 1.101 for acetyl daidzin, 1.193 for malonyl glycitin, 1.094 for acetyl glycitin, 1.199 for malonyl genistin, and 1.097 for acetyl genistin)

Calculate the quantity, T , in mg, of total isoflavones in the portion of Capsules contents taken:

$$\text{Result} = V \times C_T$$

V = final volume of the *Sample solution* (mL)

C_T = sum of concentrations (C) (mg/mL) of all relevant isoflavones

Calculate the percentage of Powdered Soy Isoflavones Extract with respect to the label claim:

$$\text{Result} = T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

T = content of total isoflavones in the portion of Capsules contents taken (mg)

A_{WT} = average weight of Capsules contents (mg/Capsule)

W = weight of the portion of Capsules contents taken (mg)

L_E = content of total isoflavones, mg, in 100 mg of the Extract used to prepare the Capsules

L = amount of Extract per Capsule according to label claim (mg/Capsule)

Acceptance criteria: NLT 90.0% and NMT 110.0% of the labeled amount of Extract, represented by the sum of the content of the isoflavones daidzin, glycitin, genistin and one or more of the following isoflavones: malonyl daidzin, malonyl glycitin, malonyl genistin, acetyl daidzin, acetyl glycitin, acetyl genistin, daidzein, glycitein, and genistein

PERFORMANCE TESTS

- DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS**

- <2040>:** Meet the requirements for *Disintegration*

- WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:** Meet the requirements

CONTAMINANTS

- MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count is NMT 10^4 cfu/g; and the total combined molds and yeasts count is NMT 10^3 cfu/g.

- ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Capsules meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

- LABELING:** The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. Label it to indicate the amount of Extract, in mg, per Capsule. Label it to indicate the percentage of isoflavones in the Extract used to prepare the Capsules.

Tailing factor: NLT 0.8 and NMT 1.2 for the daidzin peak, *Standard solution C*

Relative standard deviation: NMT 2.0%, for the genistin peak, in repeated injections, *Standard solution C*

Resolution: NLT 1.0 between acetyl glycitin and malonyl genistin, and NLT 2.0 between any other consecutive pair of isoflavone peaks, *Malonyl/Acetyl isoflavones retention times check solution 2*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, *Standard solution E*, *Malonyl/Acetyl isoflavones retention times check solution 1*, *Malonyl/Acetyl isoflavones retention times check solution 2*, and *Sample solution*

Identify the peaks of daidzin, glycitin, genistin, daidzein, glycitein, and genistein in the chromatograms of *Standard solutions A–E* by comparison with the Reference Standard Chromatogram provided with the appropriate USP Reference Standard used. Measure the peak areas of the analytes and the internal standard peaks. Determine the ratio of the peak areas of each analyte

to the internal standard peak areas. Plot the ratios of the relevant peak responses versus the concentrations, in mg/mL, of each analyte obtained from *Standard solutions A–E*, and determine the regression line by least-squares analysis. The correlation coefficient for each of the regression lines is NLT 0.999. From the graphs obtained, determine the concentration, *C*, in mg/mL, of daidzin, glycitin, and genistin, in addition to daidzein, glycitein, and genistein, if present, in the *Sample solution*. Identify the peaks of malonyl daidzin, malonyl glycitin, acetyl daidzin, acetyl glycitin, malonyl genistin, and acetyl genistin in the chromatograms of the *Malonyl/Acetyl isoflavones retention times check solutions* by comparison with the Reference Chromatograms provided with the USP Defatted Powdered Soy RS. From the graphs obtained for daidzin, glycitin, and genistin, determine the concentration, *C*, in mg/mL, of the corresponding malonyl and acetyl derivatives, if present, in the *Sample solution*:

$$\text{Result} = C_o \times F$$

- C_o* = concentration obtained from the relevant graph (mg/mL)
F = conversion factor for each analyte (1.207 for malonyl daidzin, 1.101 for acetyl daidzin, 1.193 for malonyl glycitin, 1.094 for acetyl glycitin, 1.199 for malonyl genistin, and 1.097 for acetyl genistin)

Calculate the quantity, *T*, in mg, of total isoflavones in the portion of Tablets taken:

$$\text{Result} = V \times C_T$$

- V* = final volume of the *Sample solution* (mL)
C_T = sum of concentrations (*C*) (mg/mL) of all relevant isoflavones

Calculate the percentage of Powdered Soy Isoflavones Extract with respect to the label claim:

$$\text{Result} = T \times (A_{WT}/W) \times (100/L_E) \times (100/L)$$

- T* = content of total isoflavones in the portion of Tablets taken (mg)
A_{WT} = average weight of Tablets (mg/Tablet)
W = weight of the portion of Tablets taken (mg)
L_E = content of total isoflavones, mg, in 100 mg of the Extract used to prepare the Tablets
L = amount of Extract per Tablet according to label claim (mg/Tablet)

Acceptance criteria: NLT 90.0% and NMT 110.0% of the labeled amount of Extract, represented by the sum of the content of the isoflavones daidzin, glycitin, genistin and one or more of the following isoflavones: malonyl daidzin, malonyl glycitin, malonyl genistin, acetyl daidzin, acetyl glycitin, acetyl genistin, daidzein, glycitein, and genistein

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS <2040>:** Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:** Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count is NMT 10⁴ cfu/g; and the total combined molds and yeasts count is NMT 10³ cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Tablets meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. Label it to indicate the amount of Extract, in mg, per Tablet. Label it to indicate the content, in percentage, of isoflavones in the Extract used to prepare the Tablets.

Stinging Nettle

DEFINITION

Stinging Nettle consists of dried roots and rhizomes of *Urtica dioica* L. subsp. *dioica* (Fam. Urticaceae), and may contain *Urtica urens* L., known in commerce as dwarf nettle, as a minor component. It contains NLT 0.8% of total amino acids, NLT 0.05% of β-sitosterol (C₂₉H₅₀O), and NLT 3 μg/g of scopoletin (C₁₀H₈O₄), calculated on the dried basis.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 0.05 mg/mL of USP Scopoletin RS and 0.5 mg/mL of USP β-Sitosterol RS in methanol

Sample solution: Extract 1 g of powder by refluxing with 10 mL of a solution containing toluene, ethyl acetate, and methanol (7:2:1) for 15 min, cool, and filter. Evaporate the filtrate to dryness under reduced pressure at less than 40°, and dissolve the residue in 2 mL of the mixture containing toluene, ethyl acetate, and methanol.

Chromatographic system

(See *Chromatography <621>*, *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 μL for the *Sample solution*; 10 μL for the *Standard solution*

Developing solvent system: Diethyl ether and methanol (9:1)

Spray reagent: 85% phosphoric acid, 10% vanillin in 96% ethanol, and water (4.5: 1: 4.5)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the plate and examine under UV light at 365 nm. Spray the plate with *Spray reagent*, heat between 100° and 105° for 10 min, and examine under daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a violet-red zone corresponding to β-sitosterol at the same *R_f* value as β-sitosterol in the *Standard solution*, weakly visible zones above and below β-sitosterol, and a violet-red zone corresponding to β-sitosterolglucoside.

COMPOSITION

• CONTENT OF β-SITOSTEROL

Derivatizing reagent: A solution containing equal volumes (1:1:1) of BSTFA [N,O-bis(trimethylsilyl)tri-fluoroacetamide], anhydrous pyridine, and a mixture of BSA [N,O-(trimethylsilyl)acetamide], TMSI (N-trimethylsilylimidazole), and TMCS (trimethylchlorosilane) (3:3:2)

Internal standard solution: 10 mg/mL of cholesterol in chloroform

Standard solution: Dissolve 50.0 mg of USP β-sitosterol RS in 2 mL of chloroform, add 1.0 mL of *Internal stan-*

dard solution, and dilute with chloroform to 5 mL. Dry 0.5 mL under reduced pressure, and add 1 mL of *Derivatizing reagent*.

Sample solution: Transfer 50.0 g of finely powdered Stinging Nettle to a Soxhlet apparatus, add chloroform, and extract for 6 h. The volume of chloroform used is at least twice the volume of the thimble with an appropriately sized flask. Dry the solvent under reduced pressure, add 1.0 mL of *Internal standard solution*, and dilute with chloroform to 10 mL. Transfer 0.5 mL of this solution to a 10-mL round-bottom flask, dry the solvent under reduced pressure, and add 0.5 mL of *Derivatizing reagent*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.20-mm × 25-m fused-silica capillary; 0.35-μm film of phase G2 coating

Temperature

Injector: 325°

Detector: 325°

Column: 300°, for 60 min

Carrier gas: Helium

Flow rate: 0.5 mL/min

Injection size: 1 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for each sterol peak

Relative standard deviation: NMT 5.0% determined from each sterol peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of β-sitosterol in the portion of Stinging Nettle taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times 100$$

R_U = peak response ratio of β-sitosterol to the internal standard from the *Sample solution*

R_S = peak response ratio of β-sitosterol to the internal standard from the *Standard solution*

W_S = weight of USP β-sitosterol RS used to prepare the *Standard solution* (mg)

W_U = weight of Stinging Nettle taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.05% on the dried basis

• CONTENT OF SCOPOLETIN

Solution A: Water

Solution B: Methanol

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
2	60	40
8	60	40
10	0	100
15	0	100
20	75	25
30	75	25

Standard solution: 0.02 μg/mL of USP Scopoletin RS in methanol

Sample stock solution: Extract 160 mg of finely powdered Stinging Nettle in each mL of methanol. Place in an ultrasonic bath for 25 min, and centrifuge.

Sample solution: *Sample stock solution* diluted with methanol 1 in 20

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Fluorescence detector; set at an excitation wavelength of 366 nm and an emission wavelength of 420 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor (k'): NLT 5 determined from the scopoletin peak

Tailing factor: NMT 2.0 for the scopoletin peak

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for scopoletin.

Calculate the content of scopoletin (C₁₀H₈O₄), in μg/g, in the portion of Stinging Nettle taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D$$

r_U = peak area of scopoletin from the *Sample solution*

r_S = peak area of scopoletin from the *Standard solution*

C_S = concentration of USP Scopoletin RS in the *Standard solution* (μg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Stinging Nettle taken to prepare the *Sample solution* (g)

D = dilution factor to prepare the *Sample solution* from the *Sample stock solution*

Acceptance criteria: NLT 3 μg/g on the dried basis

• CONTENT OF TOTAL AMINO ACIDS

Buffer: Mix 5.40 g of anhydrous sodium acetate, 0.3 mL of glacial acetic acid, and water to a final volume of 100 mL. Adjust to pH 5.5.

Reagent solution: Solution containing 1.00 g of ninhydrin, 1.50 g of hydrindantin, and 37.5 mL of propylene glycol. Adjust with *Buffer* to 50.0 mL. [NOTE—Prepare the *Reagent solution* daily.]

Standard solution: 20 μg/mL each of USP Glutamic Acid RS and USP Aspartic Acid RS in water

Sample solution: Finely powder Stinging Nettle, and transfer 1.0 g of it to 80 mL of water. Place in an ultrasonic bath for 25 min, and centrifuge. Transfer the supernatant to a 100-mL volumetric flask, dilute with water to volume, and filter.

Blank: Water

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Visible

Analytical wavelength: 570 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Transfer 5.0 mL of the *Standard solution*, *Sample solution*, and *Blank* to separate 50-mL volumetric flasks. Add 5.0 mL of *Reagent solution* to each flask. Heat in a boiling water bath for 30 min, cool, and adjust with a mixture of ethanol and water (1:1) to volume.

Calculate the percentage of total amino acids in the portion of Stinging Nettle taken:

$$\text{Result} = (A_U/A_S) \times C_S \times (V/W) \times F \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = sum of the concentration of USP Glutamic Acid RS and USP Aspartic Acid RS in the *Standard solution* (μg/mL)

V = volume of the *Sample solution*, 100 mL

- W = amount of Stinging Nettle taken to prepare the *Sample solution* (mg)
 F = unit conversion factor, 0.001 mg/μg
 Acceptance criteria: NLT 0.8% on the dried basis

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues (561):** Meets the requirements
- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 10^6 cfu/g, the total combined molds and yeasts count does not exceed 10^4 cfu/g, and the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS• **BOTANIC CHARACTERISTICS**

Macroscopic: The rhizome is irregularly bent, about 3–10 mm thick, and light gray-brown on the outside; thin roots spring from the knotty bulges of a lengthwise furrow. A transverse cut of the rhizome shows it is fibrous, light yellowish white, and usually has a small medulla cave. The roots are often very long, usually 0.5–2 mm thick, light yellow-brown on the outside, and contain some deep longitudinal furrows; a transverse cut shows a pale and almost pure-white color.

Microscopic: The transverse section of the rhizome and root shows the following characteristics. The rhizome has a narrow cork composed of brown, thin-walled cells, a few rows of tangentially elongated cortical parenchyma, and a pericyclic region with numerous fibers occurring singly or, more frequently, in small groups. Fibers are much elongated with very thick and lignified walls. Some cells of the pericycle and outer part of secondary phloem contain large globular compound crystals of calcium oxalate. The vascular cambial region is distinct and continuous with narrow radial groups of vascular tissue separated by wide medullary rays. The secondary phloem is mainly parenchymatous with groups of thin-walled sieve tissue. The xylem is dense and completely lignified, containing scattered vessels, isolated or in small groups, associated with moderately thickened xylem parenchyma cells and numerous thicker-walled xylem fibers with slit-shaped pits. Individual vessels have fairly large, closely arranged, bordered pits, while the adjacent parenchyma has simple or bordered pits. Medullary rays indicate alternating areas of lignified and unlignified cells, appearing as tangential bands between the vascular bundles, each composed of 5 or 6 layers of cells; the lignified cells have moderately thickened walls with simple pits. The pith is composed of rounded, unlignified parenchyma, collapsed in the central part to form a cavity. Mature roots show a thin cork, narrow phelloderm, and secondary phloem and xylem with alternating areas of lignified and unlignified parenchyma in the wide medullary rays, similar to that found in the rhizome.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 2.0%
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 10%
- **LOSS ON DRYING (731)** Dry 1.0 g of Stinging Nettle, finely powdered, at 105° for 2 h: it loses NMT 12.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

• **USP REFERENCE STANDARDS (11)**

Powdered Stinging Nettle Extract

DEFINITION

Powdered Stinging Nettle Extract is prepared from comminuted Stinging Nettle with 60% alcohol or other suitable solvents. It contains NLT 5.0% of total amino acids, NLT 0.1% of β -sitosterol ($\text{C}_{29}\text{H}_{50}\text{O}$), and NLT 30 $\mu\text{g/g}$ of scopoletin ($\text{C}_{10}\text{H}_8\text{O}_4$). The ratio of the starting crude plant material to Powdered Extract is 10:1.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 0.05 mg/mL of USP Scopoletin RS and 0.5 mg/mL of USP β -Sitosterol RS in methanol

Sample solution: Dissolve 0.6 g of Powdered Extract, in a mixture of toluene, ethyl acetate, and methanol (7:2:1). Filter, and dry under reduced pressure at a temperature below 40°. Dissolve the residue in 2.0 mL of the mixture containing toluene, ethyl acetate, and methanol.

Chromatographic system

(See *Chromatography (621)*, *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 20 μL for the *Sample solution*; 10 μL for the *Standard solution*

Developing solvent system: Diethyl ether and methanol (9:1)

Spray reagent: 85% phosphoric acid, 10% vanillin in 96% ethanol, and water (4.5: 1: 4.5)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Examine the plates under UV light at 365 nm. Spray the plate with 10 mL of *Spray reagent*, heat between 100° and 105° for 10 min, and examine under daylight.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits a violet-red zone corresponding to β -

sitosterol at the same R_f value as β -sitosterol from the *Standard solution*, weakly visible zones above and below β -sitosterol, and a violet-red zone corresponding to β -sitosterolglucoside.

• B. GAS CHROMATOGRAPHY IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of β -Sitosterol*.

Acceptance criteria: The retention time of β -sitosterol of the *Sample solution* corresponds to that of the *Standard solution*.

• C. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Scopoletin*.

Acceptance criteria: The retention time of scopoletin of the *Sample solution* corresponds to that of the *Standard solution*.

COMPOSITION

• CONTENT OF β -SITOSTEROL

Derivatizing reagent: A solution containing equal volumes (1:1:1) of BSTFA [*N,O*-bis(trimethylsilyl)tri-fluoroacetamide], anhydrous pyridine, and a mixture of BSA [*N,O*-(trimethylsilyl)acetamide], TMSI (*N*-trimethylsilylimidazole), and TMCS (trimethylchlorosilane) (3:3:2)

Internal standard solution: 10 mg/mL of cholesterol in chloroform

Standard solution: Dissolve 50.0 mg of USP β -Sitosterol RS in 2 mL of chloroform, add 1.0 mL of *Internal standard solution*, and dilute to 5 mL with chloroform. Dry 0.5 mL under reduced pressure, and add 1 mL of *Derivatizing reagent*.

Sample solution: Transfer 20.0 g of Powdered Extract to a Soxhlet apparatus, treat with chloroform, and extract for 6 h. The volume of chloroform used is at least twice the volume of the thimble with an appropriately sized flask. Dry the solvent under reduced pressure, add 1.0 mL of *Internal standard solution*, and dilute with chloroform to 10 mL. Transfer 0.5 mL of this solution to a 10-mL round-bottom flask, dry the solvent under reduced pressure, and add 0.5 mL of *Derivatizing reagent*.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.20-mm \times 25-m fused-silica capillary; 0.35- μm film of phase G2 coating

Temperature

Injector: 325°

Detector: 325°

Column: 300°, for 60 min

Carrier gas: Helium

Flow rate: 0.5 mL/min

Injection size: 1 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for each sterol peak

Relative standard deviation: NMT 5.0% determined from each sterol peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of β -sitosterol in the portion of Powdered Extract taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times 100$$

R_U = peak response ratio of β -sitosterol to the internal standard from the *Sample solution*

R_S = peak response ratio of β -sitosterol to the internal standard from the *Standard solution*

W_S = weight of USP β -Sitosterol RS used to prepare the *Standard solution* (mg)

W_U = weight of Powdered Extract in the *Sample solution* (mg)

- Acceptance criteria: NLT 0.1%
- **CONTENT OF SCOPOLETIN**
 Solution A: Water
 Solution B: Methanol
 Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
2	60	40
8	60	40
10	0	100
15	0	100
20	75	25
30	75	25

Standard solution: 0.02 µg/mL of USP Scopoletin RS in methanol

Sample stock solution: 8 mg/mL of Powdered Extract in methanol. Place in an ultrasonic bath for 25 min, and centrifuge.

Sample solution: *Sample stock solution* diluted with methanol 1 in 20

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Fluorescence; set at an excitation wavelength of 366 nm and an emission wavelength of 420 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor (k'): NLT 5 determined from the scopoletin peak

Tailing factor: NMT 2.0 for the scopoletin peak

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for scopoletin.

Calculate the content of scopoletin (C₁₀H₈O₄), in µg/g, in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U)$$

r_U = peak area of scopoletin from the *Sample solution*

r_S = peak area of scopoletin from the *Standard solution*

C_S = concentration of USP Scopoletin RS in the *Standard solution* (µg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (g/mL)

Acceptance criteria: NLT 30 µg/g

• **CONTENT OF TOTAL AMINO ACIDS**

Buffer: Mix 5.40 g of anhydrous sodium acetate, 0.3 mL of glacial acetic acid, and water to a final volume of 100 mL. Adjust to pH 5.5.

Reagent solution: Solution containing 1.00 g of ninhydrin, 1.50 g of hydrindantin, and 37.5 mL of propylene glycol. Adjust with *Buffer* to 50.0 mL. [NOTE—Prepare the *Reagent solution* daily.]

Standard solution: 20 µg/mL each of USP Glutamic Acid RS and USP Aspartic Acid RS in water

Sample solution: Dissolve 50 mg of Powdered Extract in 80 mL of water, shake for 10 min, dilute with water to 100 mL, and filter.

Blank: Water

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Visible

Analytical wavelength: 570 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
 Transfer 5.0 mL of the *Standard solution*, *Sample solution*, and *Blank* to separate 50-mL volumetric flasks. Add 5.0 mL of *Reagent solution* to each flask. Heat in a boiling water bath for 30 min, cool, and adjust with a mixture of ethanol and water (1:1) to volume. Calculate the percentage of total amino acids in the portion of Powdered Extract taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = sum of the concentration of USP Glutamic Acid RS and USP Aspartic Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Powdered Extract in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 5.0%

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN, Pesticide Residues** <561>:

Meets the requirements

- **ALCOHOL DETERMINATION, Method II** <611>: NMT 1.0%, if present

- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g.

- **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry 1.0 g of Powdered Extract at 105° for 2 h: it loses NMT 8.0% of its weight.

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 20.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.

- **LABELING:** The label states the official name of the article, the Latin binomial, and, following the official name, the part of the plant from which the article was prepared. Label it to indicate the content of total amino acids, β-sitosterol, scopoletin, the extracting solvent used for preparation, and the ratio of the starting crude plant material to Powdered Extract.

Turmeric

DEFINITION

Turmeric is the dried rhizome of *Curcuma longa* L., also known as *C. domestica* Val., (Fam. Zingiberaceae). It is commonly known as Curcuma, Curcum, Haridra, and Indian Saffron. It contains NLT 3.0% of curcuminoids, calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution: 0.2 mg/mL of USP Curcuminoids RS in acetone
Sample solution: Pulverize about 5 g of Turmeric. Transfer about 0.2 g of the pulverized sample to a test tube, add 3 mL of acetone, sonicate for 30 min, and centrifuge. Use the supernatant.
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)
Application volume: 10 µL, as bands
Developing solvent system: Chloroform, methanol, and formic acid (96:4:1)
Analysis
Samples: *Standard solution* and *Sample solution*
 Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621), *Thin Layer Chromatography*). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine in daylight and under UV light at 365 nm.
Acceptance criteria: The *Sample solution* chromatogram shows yellowish-brown bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin at R_f values of about 0.4, 0.6, and 0.7, respectively, corresponding in position and color to those obtained from the *Standard solution*.
- **B.** The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* chromatogram correspond to those of the *Standard solution* for the appropriate USP Reference Standard, as obtained in the test for *Content of Curcuminoids*.

COMPOSITION

• CONTENT OF CURCUMINOIDS

Mobile phase: Tetrahydrofuran and 1 mg/mL of citric acid in water (4:6)

[NOTE—Sonication may be necessary to dissolve the Reference Standard in each *Standard solution*; all solutions should be passed through a filter of 0.45-µm pore size before injection. USP Curcumin RS, USP Desmethoxycurcumin, and USP Bisdesmethoxycurcumin RS can also be prepared in one standard solution containing the final concentration specified below for each.]

Standard solution A: 40 µg/mL of USP Curcuminoids RS in *Mobile phase*

Standard solution B: 40 µg/mL of USP Curcumin RS in *Mobile phase*

Standard solution C: 10 µg/mL of USP Desmethoxycurcumin RS in *Mobile phase*

Standard solution D: 2 µg/mL of USP Bisdesmethoxycurcumin RS in *Mobile phase*

Sample stock solution: Pulverize about 5.0 g of Turmeric. Transfer about 0.5 g of the pulverized sample to a 50-mL volumetric flask, add 30 mL of acetone, and sonicate for 30 min. Dilute with acetone to volume, mix, and centrifuge.

Sample solution: Transfer 5 mL of the *Sample stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 420 nm

Column: 4.6-mm × 20-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution A*

[NOTE—The relative retention times for the curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin peaks are 1.0, 1.2, and 1.4, respectively.]

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution A* is similar to the Reference Chromatogram provided with USP Curcuminoids RS.

Resolution: NLT 2.0, between the curcumin and desmethoxycurcumin peaks and the desmethoxycurcumin and bisdesmethoxycurcumin peaks

Tailing factor: NMT 1.5 for bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin peaks

Relative standard deviation: NMT 2.0% for desmethoxycurcumin peak, in repeated injections

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, and *Sample solution*

Calculate the percentage of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin in the portion of Turmeric taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times 100$$

r_U = peak response for curcumin, desmethoxycurcumin, or bisdesmethoxycurcumin from the *Sample solution*

r_S = peak response for curcumin, desmethoxycurcumin, or bisdesmethoxycurcumin from the appropriate *Standard solution*

C_S = concentration of the appropriate *Standard solution* (mg/mL)

V = volume of the *Sample stock solution* (mL)

W = weight of Turmeric used to prepare the *Sample stock solution* (mg)

D = dilution factor to obtain the *Sample solution* from the *Sample stock solution*

Acceptance criteria: NLT 3% as the sum of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin on the dried basis

CONTAMINANTS

- **HEAVY METALS**, *Method III* (231): NMT 20 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *General Method for Pesticide Residues Analysis* (561): Meets the requirements
- **ARTICLES OF BOTANICAL ORIGIN**, *Test for Aflatoxins* (561): Meets the requirements
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

• BOTANIC CHARACTERISTICS

Macroscopic: Turmeric occurs as ovate, oblong, or pear-shaped primary rhizomes, also known as bulb or round turmeric, about 3 cm in diameter and 4–5 cm long, and showing transverse annular leaf scars, and as cylindrical, sometimes short-branched secondary rhizomes, also known as finger or long turmeric, about 1 cm in diameter and 2–7 cm long, and showing scars of lateral branches. The cured and dried turmeric of commerce is bright yellow to dull yellow in appearance, with a rough or polished surface, and a characteristic aromatic odor. The texture is hard and uneasily broken, and the fracture is smooth and finely granular. Internally it is orange-yellow to orange, showing a cortex separated from a central cylinder by a distinct endodermis.

Histology

Transverse section of rhizome: It shows a row of thin-walled, flattened epidermal cells; a few layers of thin-walled, brick-shaped parenchyma cells of the cork; a broad cortex consisting of multiple layers of thin-walled parenchyma cells showing scattered vascular bundles; a thin layer of oblong cells of the endodermis; pericycle consisting of one to two rows of parenchyma cells; and a pith consisting of parenchyma cells showing scattered vascular bundles, most of them forming discontinuous rings near the endodermis and fewer inward. The vascular bundles are of the collateral type; the vessels have mainly spiral thickening, and a few have reticulate and annular thickening. Scattered throughout the parenchyma of the pith and cortex are oleoresin cells containing oil and scattered particles of an orange-yellow pigment, and prisms of calcium oxalate, which are usually obscured due to the bright yellow color of the pigment content. The parenchyma cells are full of starch granules, 15–30 μ m in size, and flat or disk shaped. Bast fibers are absent.

2-[(all-E)-3,7,11,15,19,23,27,31,35,39-Decamethyl-2,6,10,14,18,22,26,30,34,38-tetracontadecaenyl]-5,6-dimethoxy-3-methyl-p-benzoquinone [303-98-0].

DEFINITION

Ubidecarenone (Coenzyme Q₁₀) contains NLT 98.0% and NMT 101.0% of ubidecarenone ($C_{59}H_{90}O_4$), calculated on the anhydrous basis.

IDENTIFICATION• **A. INFRARED ABSORPTION** <197K>• **B.**

Analysis: Dissolve 50 mg of Ubidecarenone in 1 mL of ethyl ether, and add 10 mL of dehydrated alcohol. To 2 mL of this solution add 3 mL of dehydrated alcohol and 2 mL of dimethyl malonate. Add 1 mL of potassium hydroxide solution (1 in 5) dropwise.

Acceptance criteria: A blue color appears.

ASSAY• **PROCEDURE**

Mobile phase: Methanol and dehydrated alcohol (65:35)

System suitability solution: 0.5 mg/mL each of USP Ubidecarenone RS and USP Ubidecarenone Related Compound A RS in dehydrated alcohol. Heat at 50° for 2 min, if necessary, for complete dissolution.

Standard solution: 1.0 mg/mL of USP Ubidecarenone RS in dehydrated alcohol. Heat at 50° for 2 min, if necessary, for complete dissolution.

Sample solution: 1.0 mg/mL of Ubidecarenone in dehydrated alcohol. Heat at 50° for 2 min, if necessary, for complete dissolution.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 15-cm; packing L1

Column temperature: 35°

Flow rate: Adjust to obtain a retention time of about 11 min for ubidecarenone.

Injection size: 5 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for ubidecarenone related compound A and ubidecarenone are about 0.75 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4 between ubidecarenone related compound A and ubidecarenone

Relative standard deviation: NMT 0.8% for ubidecarenone

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of ubidecarenone (C₅₉H₉₀O₄) in the portion of Ubidecarenone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Ubidecarenone RS in the *Standard solution* (mg/mL)

C_U = concentration of Ubidecarenone in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.0% on the anhydrous basis

IMPURITIES• **RESIDUE ON IGNITION** <281>: NMT 0.1%• **HEAVY METALS, Method II** <231>: NMT 20 ppm• **CHROMATOGRAPHIC PURITY**

Procedure 1: Coenzymes Q₇, Q₈, Q₉, Q₁₁, and Related Impurities

Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: *Sample solution*

Calculate the percentage of impurities in the portion of Ubidecarenone taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times 100$$

r_{T1} = sum of all peak responses, other than that for ubidecarenone

r_{T2} = sum of all peak responses

Acceptance criteria: NMT 1.0%

Procedure 2: Ubidecarenone (2Z)-Isomer and Related Impurities

Mobile phase: *n*-Hexane and ethyl acetate (97:3)

System suitability solution: 1 mg/mL of USP

Ubidecarenone for System Suitability RS in *n*-hexane

Sample solution: 1 mg/mL of Ubidecarenone in *n*-hexane

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 25-cm; packing L3

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for ubidecarenone (2Z)-isomer and ubidecarenone are about 0.85 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the ubidecarenone (2Z)-isomer and ubidecarenone

Analysis

Sample: *Sample solution*

Calculate the percentage of impurities in the portion of Ubidecarenone taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times 100$$

r_{T1} = sum of all peak responses, other than that for ubidecarenone

r_{T2} = sum of all peak responses

Acceptance criteria: NMT 1.0%

Total impurities: NMT 1.5%, obtained from *Chromatographic Purity Procedures 1 and 2*

SPECIFIC TESTS• **WATER DETERMINATION, Method I** <921>: NMT 0.2%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.• **USP REFERENCE STANDARDS** <11>

USP Ubidecarenone for System Suitability RS

Ubidecarenone Capsules**DEFINITION**

Ubidecarenone Capsules contain NLT 90.0% and NMT 115.0% of the labeled amount of ubidecarenone (C₅₉H₉₀O₄).

IDENTIFICATION• **A.** The retention time of the major peak of either *Sample solution 1* or *Sample solution 2* corresponds to that of the *Standard solution*, as obtained in the *Procedure for Strength*.**STRENGTH**• **PROCEDURE**

[NOTE—Conduct this test promptly with minimum exposure to actinic light.]

Solvent: *n*-Hexane and dehydrated alcohol (5:2)

Mobile phase: Acetonitrile, tetrahydrofuran, and water (55:40:5)

Standard stock solution: 1.0 mg/mL of USP Ubidecarenone RS in *Solvent*

Standard solution: 40 µg/mL in dehydrated alcohol, from the *Standard stock solution*

System suitability stock solution: 1.0 mg/mL of USP Ubidecarenone Related Compound A RS in *Solvent*. Dilute a portion of this solution with dehydrated alcohol to obtain a concentration of 40 µg/mL.

System suitability solution: *Standard solution* and *System suitability stock solution* (1:1)

Sample solution 1 (for soft gelatin Capsules): Open a number of Capsules equivalent to 200 mg of ubidecarenone, quantitatively transfer the shells and contents to a container, add 100 mL of *Solvent*, and shake by mechanical means for 30 min. Using small portions of *Solvent*, quantitatively transfer this mixture to a 200-mL volumetric flask, and dilute with *Solvent* to volume. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a 25-mL volumetric flask, add 2.5 mL of a 0.1% solution of anhydrous ferric chloride in alcohol, and dilute with alcohol to volume.

Sample solution 2 (for hard gelatin Capsules): Empty and thoroughly mix the contents of NLT 20 Capsules. Transfer a portion of the powder, equivalent to 100 mg of ubidecarenone, to a 100-mL volumetric flask, add 60 mL of *Solvent*, and shake by mechanical means for 30 min. Dilute with *Solvent* to volume. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a 25-mL volumetric flask, add 2.5 mL of a 0.1% solution of anhydrous ferric chloride in alcohol, and dilute with alcohol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 8-mm × 10-cm; packing L1

Flow rate: 2.5 mL/min

Injection size: 15 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 2.5 between ubidecarenone and ubidecarenone related compound A, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0% for ubidecarenone, *Standard solution*

Analysis

Samples: *Sample solution 1* or *Sample solution 2*, and *Standard solution*

Calculate the percentage of the labeled amount of ubidecarenone (C₅₉H₉₀O₄) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of ubidecarenone from *Sample solution 1* or *Sample solution 2*

r_S = peak area of ubidecarenone from the *Standard solution*

C_S = concentration of USP Ubidecarenone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ubidecarenone in *Sample solution 1* or *Sample solution 2* (mg/mL)

Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements of the test for *Disintegration*, except where the product is labeled to contain a water-soluble form of ubidecarenone. Capsules labeled to contain a water-soluble form of ubidecarenone meet the requirements for the test for *Dissolution*, as follows.

Medium: Water; 500 mL

Apparatus 2: 75 rpm

Time: 60 min

Standard solution: Dissolve 25 mg of USP Ubidecarenone RS in 1 mL of ethyl ether, and dilute with alcohol to obtain a concentration of 2.5 µg/mL. [NOTE—Use a freshly prepared solution only.]

Sample solution: Dilute with alcohol a volume of the solution under test, previously passed through a suitable filter of 0.45-µm pore size, to obtain a concentration of 2.5 µg/mL of ubidecarenone.

Mobile phase and Chromatographic system: Proceed as directed in the *Procedure* for *Strength*, except for *Injection size*.

Injection size: 100 µL

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ubidecarenone (C₅₉H₉₀O₄) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V \times D/L) \times 100$$

r_U = peak area of ubidecarenone from the *Sample solution*

r_S = peak area of ubidecarenone from the *Standard solution*

C_S = concentration of USP Ubidecarenone RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 500 mL

D = dilution factor for the *Sample solution*

L = label claim (mg/Capsule)

Tolerances: NLT 75% of the labeled amount of ubidecarenone (C₅₉H₉₀O₄) is dissolved.

SPECIFIC TESTS

- **WEIGHT VARIATION** <2091>: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Where the product contains a water-soluble form of ubidecarenone, this is so stated on the label.
- **USP REFERENCE STANDARDS** <11>
 - USP Ubidecarenone RS

Valerian

DEFINITION

Valerian consists of the subterranean parts of *Valeriana officinalis* L. (Fam. Valerianaceae) including the rhizome, roots, and stolons. It contains NLT 0.5% of volatile oil and NLT 0.05% of valerenic acid ($C_{15}H_{22}O_2$), calculated on the dried basis.

IDENTIFICATION

- **A. COLOR REACTION**

Sample solution: 0.2 g of freshly powdered Valerian in 5 mL of methylene chloride. Shake several times, and allow to stand for 5 min. Filter, wash the filter with 2 mL of methylene chloride, and combine the filtrate and washings in one container. Heat the combined filtrate and washings on a water bath for the minimum time required to evaporate the solvent, and dissolve the residue in 0.2 mL of methylene chloride.

Analysis: To 0.1 mL of the *Sample solution* add 3 mL of a mixture of equal volumes of glacial acetic acid and 25% hydrochloric acid, and shake several times.

Acceptance criteria: A blue color develops within 15 min.

- **B. HPLC IDENTIFICATION TEST**

Analysis: Proceed as directed in the test for *Content of Valerenic Acid*.

Acceptance criteria: The *Sample solution* chromatogram exhibits a peak for valerenic acid at a retention time that corresponds to that of the *Standard solution*.

COMPOSITION

- **CONTENT OF VALERENIC ACID**

Mobile phase: A (4:1) mixture of methanol and dilute phosphoric acid (1 in 200)

Standard solution: 0.05 mg/mL of USP Valerenic Acid RS in 70% alcohol

Sample solution: To 2 g of Valerian, reduced to a powder, add 40.0 mL of 70% alcohol. Shake by mechanical

means for 2 h at room temperature. Centrifuge, and use the clear extract.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the valerenic acid peak

Relative standard deviation: NMT 2.0% for the valerenic acid peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of valerenic acid (C₁₅H₂₂O₂) in the portion of Valerian taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

W = weight of Valerian taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.05% on the dried basis

ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Determination <561>

Sample: 100 g, freshly and coarsely comminuted

Acceptance criteria: NLT 0.5% on the dried basis

CONTAMINANTS

- **ARTICLES OF BOTANICAL ORIGIN, General Method for Pesticide Residues Analysis <561>**: Meets the requirements
- **MICROBIAL ENUMERATION TESTS <2021>**: The total bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, and bile-tolerant Gram-negative bacteria does not exceed 10³ cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS <2022>**: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Macroscopic: Rhizome erect, entire or usually cut longitudinally, up to 5 cm in length and up to 3 cm in diameter, yellowish gray to pale grayish brown, base elongated or compressed, covered by and merging with numerous roots; apex usually bearing a cup-shaped scar from aerial parts, stem bases rarely present; in longitudinal section, pith exhibiting a central cavity traversed by septa. Roots numerous, slender, almost cylindrical, and of the same color as the rhizome, about 10 cm in length and up to 3 mm in diameter; a few filiform, fragile secondary roots; fracture short. Stolon pale yellowish gray, showing prominent nodes separated by longitudinally striated internodes each from 2 to 5 cm in length; fracture fibrous.

Microscopic: Root, with piliferous layer, of papillose cells, some being developed into root hairs; exodermis, or a single layer of quadrangular to polygonal cells with suberized walls and containing globules of volatile oil; outer cortex of two to four layers of resin-containing cells with thin or collenchymatous, sometimes suberized walls; inner cortex of numerous layers of polygonal to rounded cells filled with starch. Numerous starch granules, mostly compound of 2 to 6 components, spheroidal, plano-convex, up to 30 µm in diameter; or simple, from 8 to 12 µm, occasionally up to 20 µm in

diameter, with a central hilum. Endodermis consisting of a single layer of suberized, tangentially elongated cells, pericycle continuous, starch-filled; parenchyma surrounding the phloem zone; cambium frequently indistinct; vascular bundles forming an interrupted ring surrounding the starch-filled cells. Rhizome in transverse section, different from the root, its structure being complicated by the presence of numerous vascular bundles from root and stolon; epidermis and exodermis partially replaced by poorly developed periderm; central pith wide, including cavities of various sizes, the larger ones being separated by plates of partially sclerified tissue.

ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter <561>

EXTRACTABLE MATTER

Sample: 2 g, carefully dried at 40° and coarsely powdered

Analysis: Mix the *Sample* with 20 mL of 70% alcohol, and allow to stand for 2 h, shaking frequently. Filter, evaporate 5 mL of the filtrate on a water bath to dryness, and dry the residue at 105°.

Acceptance criteria: NLT 20%. The weight of the dried residue is NLT 100 mg.

Powdered Valerian Extract

DEFINITION

Powdered Valerian Extract is prepared from comminuted Valerian and with 70% alcohol or other suitable solvents. It contains NLT 0.3% of valerenic acid (C₁₅H₂₂O₂). The ratio of the starting crude plant material to the Extract is between 4:1 and 7:1.

IDENTIFICATION**• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 0.5 mg/mL each of USP Fluorescein RS and USP Valerenic Acid RS, in methanol

Sample solution: Dissolve 0.2 g of Extract in 2 mL of water, add 3 mL of a 10% aqueous solution of potassium hydroxide, and extract this mixture with two 5-mL portions of methylene chloride. Discard the organic phase, heat the aqueous phase on a water bath at 40° for 10 min, cool, acidify with 7% hydrochloric acid, and extract this solution with two 5-mL portions of methylene chloride. Dry the organic phase over anhydrous sodium sulfate, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1.0 mL of methylene chloride.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture

Application volume

Standard solution: 10 µL

Sample solution: 20 µL

Developing solvent system: Solvent hexane, ethyl acetate, and glacial acetic acid (65: 35: 0.5)

Spray reagent: Mix 0.5 mL of anisaldehyde with 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of sulfuric acid, added in the sequence specified.

Analysis

Samples: *Standard solution* and *Sample solution*

Spray the plate with *Spray reagent*. Heat the plate in an oven at 105° for 10 min, and examine the plate under white light.

Acceptance criteria: The *Standard solution* chromatogram shows a violet zone due to valerenic acid at an R_f value of 0.4, and a yellow zone due to fluorescein at an R_f value of 0.1. The *Sample solution* chromatogram shows a violet zone due to valerenic acid at an R_f value of 0.4, and a blue-violet zone due to hydroxyvalerenic acid at an R_f value of 0.12, just above the yellow zone in the *Standard solution*. The chromatogram of the *Sample solution* may show other colored zones at R_f values lower than those of valerenic acid.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Valerenic Acid*.

Acceptance criteria: The *Sample solution* chromatogram exhibits a peak at a retention time that corresponds to that of valerenic acid in the *Standard solution*.

COMPOSITION

• CONTENT OF VALERENIC ACID

Mobile phase: Methanol and water (77:27). Add 0.5 mL of phosphoric acid to each 100 mL of the mixture.

Standard solution: 0.024 mg/mL of USP Valerenic Acid RS in methanol

Sample solution: Transfer a quantity of the Extract, nominally equivalent to 0.6 mg of valerenic acid, to a 25-mL volumetric flask, and add 15 mL of methanol. Stir for 10 min, dilute with methanol to volume, mix, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor (k'): NLT 5 determined from the valerenic acid peak

Tailing factor: NMT 2.0 for valerenic acid

Relative standard deviation: NMT 2.0% for the valerenic acid peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of valerenic acid (C₁₅H₂₂O₂) in the portion of the Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Valerenic Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of the Extract in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 0.3%

CONTAMINANTS

• ARTICLES OF BOTANICAL ORIGIN, *Pesticide Residues* <561>:

Meets the requirements

• ALCOHOL DETERMINATION, *Method II* <611>: NMT 2.0%, if present

• MICROBIAL ENUMERATION TESTS <2021>: The total bacterial count does not exceed 10⁴ cfu/g, the total combined molds and yeasts count does not exceed 10³ cfu/g, the coliform count does not exceed 10³ cfu/g, and the *Enterobacteriaceae* count does not exceed 10³ cfu/g.

• ABSENCE OF SPECIFIED MICROORGANISMS <2022>: It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

SPECIFIC TESTS

• LOSS ON DRYING <731>: Dry 1.0 g of the Extract at 105° for 2 h: it loses NMT 9.0% of its weight.

• ARTICLES OF BOTANICAL ORIGIN, *Total Ash* <561>: NMT 7.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers, store at controlled room temperature, and protect from moisture and light.

• LABELING: The label states the official name of the article and states also the Latin binomial and the part of the

plant from which the article was prepared. Label it to indicate the content of valerenic acid, the extracting solvent used for preparation, and the ratio of the starting crude plant material to the Extract.

• USP REFERENCE STANDARDS <11>

USP Fluorescein RS

USP Valerenic Acid RS

Valerian Tablets

DEFINITION

Valerian Tablets contain Powdered Valerian Extract. Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of Powdered Valerian Extract, calculated as valerenic acid (C₁₅H₂₂O₂).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

Standard solution: 0.5 mg/mL each of USP Fluorescein RS and USP Valerenic Acid RS in methanol

Sample solution: Transfer an equivalent to 100 mg of Powdered Valerian Extract from finely powdered Tablets (NLT 10) to a suitable flask. Add 5 mL of water and 3 mL of a 10% aqueous solution of potassium hydroxide, extract this mixture with two 5-mL portions of methylene chloride, and discard the organic phase. Heat the aqueous phase in a water bath at 40° for 10 min, cool, acidify with 7% hydrochloric acid, and extract this solution with two 5-mL portions of methylene chloride. Dry the organic phase over anhydrous sodium sulfate, filter, evaporate the filtrate to dryness, and dissolve the residue in 1.0 mL of methylene chloride.

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture

Application volume

Standard solution: 10 µL

Sample solution: 20 µL, in a 2-cm band

Developing solvent system: Solvent hexane, ethyl acetate, and glacial acetic acid (65:35:0.5)

Spray reagent: Mix 0.5 mL of anisaldehyde with 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of sulfuric acid, added in the sequence specified.

Analysis

Samples: *Standard solution* and *Sample solution*

Spray the plate with *Spray reagent*. Heat the plate in an oven at 105° for 10 min, and examine the plate under white light.

Acceptance criteria: The *Standard solution* chromatogram shows a violet zone due to valerenic acid at an R_F value of 0.4, and a yellow zone due to fluorescein at an R_F value of 0.1. The *Sample solution* chromatogram shows a violet zone due to valerenic acid at an R_F value of 0.4, and a blue-violet zone due to hydroxyvalerenic acid at an R_F value of 0.12, just above the yellow zone in the *Standard solution*. The *Sample solution* chromatogram may show other colored zones at R_F values lower than those of valerenic acid.

• B. The retention time of the valerenic acid peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Valerenic Acid*.

STRENGTH

• CONTENT OF VALERENIC ACID

Mobile phase: Methanol and water (77:27). Add 0.5 mL of phosphoric acid to each 100 mL of the mixture.

System suitability solution: 24 µg/mL of USP Valerenic Acid RS in methanol

Standard solution: 3.5 µg/mL of USP Valerenic Acid RS in methanol

Sample solution: Weigh NLT 20 Tablets, and pulverize with a mortar and pestle. Transfer a portion of the powder, nominally equivalent to 0.09 mg of valerenic acid, to a suitable flask. Add 25.0 mL of methanol, shake to disperse the powder, sonicate for 10 min, and centrifuge. Use the clear supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Capacity factor, k': NLT 5, determined from valerenic acid

Tailing factor: NMT 2.0 for valerenic acid

Relative standard deviation: NMT 2.0% for valerenic acid

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of Extract as valerenic acid in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S \times V/W) \times (100/L_E) \times (A_W \times 100/L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Valerenic Acid RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of the sample of powdered Tablets used to prepare the *Sample solution* (mg)

A_W = average weight of the Tablets (mg/Tablet)

L_E = labeled amount of valerenic acid in 100 mg of the Extract used to prepare the Tablets (mg)

L = labeled amount of Extract per Tablet (mg/Tablet)

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 10,000 cfu/g, and the total combined molds and yeasts count does not exceed 1000 cfu/g.
- **MICROBIAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. The label also indicates the quantity, in mg, of Powdered Valerian Extract per Tablet and the content, in mg, of valerenic acid per 100 mg of Powdered Valerian Extract.
- **USP REFERENCE STANDARDS** <11>
 - USP Fluorescein RS
 - USP Valerenic Acid RS

Vinpocetine

$C_{22}H_{26}N_2O_2$ 350.45
Eburnamenine-14-carboxylic acid, ethyl ester, (3 α ,16 α)-;
Ethyl apovincamin-22-oate [42971-09-5].

DEFINITION

Vinpocetine contains NLT 98.5% and NMT 101.5% of $C_{22}H_{26}N_2O_2$, calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION <197K>

- **B.** The retention time of the main peak of the *Sample solution* corresponds to that of the principal peak for the *Stock standard solution*, as obtained in the test for *Organic Impurities*.

ASSAY

• TITRIMETRY

(See *Titrimetry* <541>.)

Sample: 300 mg of Vinpocetine in 50 mL of a mixture of acetic anhydride and acetic acid (1:1)

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis

Perform a blank determination, and make any necessary correction. Calculate the percentage of $C_{22}H_{26}N_2O_2$ in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

V = volume of titrant consumed by the *Sample* (mL)

B = volume of titrant consumed by the blank (mL)

N = normality of the titrant (mEq/mL)

F = equivalency factor, 350.5 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS, Method II** <231>: 10 ppm

Organic Impurities

• PROCEDURE

Ammonium acetate solution: 15.4 g/L ammonium acetate in water

Mobile phase: Acetonitrile and *Ammonium acetate solution* (55:45)

Sample solution: 1.00 mg/mL of Vinpocetine in *Mobile phase*

Stock standard solution: 0.02 mg/mL of USP Vinpocetine RS in *Mobile phase*

Standard solution 1: 0.12 mg/mL of USP Vinpocetine Related Compound A RS and 0.10 mg/mL each of USP Vinpocetine Related Compound B RS, USP Vinpocetine Related Compound C RS, and USP Vinpocetine Related Compound D RS in *Mobile phase*

Standard solution 2: Dilute 1.0 mL of *Stock standard solution* and 1.0 mL of *Standard solution 1* with *Mobile phase* to 20.0 mL.

Chromatographic system

(See *Chromatography* <621>, *System suitability*.)

Valine—see *Valine General Monographs*

Mode: LC

Detector: 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.0 mL/min

Chromatograph the *Stock standard solution* and *Standard solution 2*, and identify the vinpocetine peak and peaks due to the related compounds listed in *Impurity Table 1*.

Injection size: 15 μL (duplicate equal volumes)

System suitability

Sample: *Standard solution 2*

Suitability requirements

Resolution: NLT 2.0 between vinpocetine related compound B and vinpocetine related compound D

Analysis

Samples: *Sample solution* and *Standard solution 2*

Record the chromatograms for up to a minimum of three times the retention time of vinpocetine. Disregard any peak with an area less than 0.5 times the area of the peak due to vinpocetine in *Standard solution 2*. Calculate the percentage of vinpocetine related compounds A, B, C, and D in the portion of Vinpocetine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each of the known impurities from the *Sample solution*
 r_S = peak response of the corresponding Standard for each of the known impurities from *Standard solution 2*
 C_S = concentration of the corresponding USP Reference Standard for each of the known impurities in *Standard solution 2* (mg/mL)
 C_U = concentration of Vinpocetine in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified individual impurity, as vinpocetine, in the portion of Vinpocetine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each of the unspecified impurities from the *Sample solution*
 r_S = peak response of vinpocetine from *Standard solution 2*
 C_S = concentration of USP Vinpocetine RS in *Standard solution 2* (mg/mL)
 C_U = concentration of Vinpocetine in the *Sample solution* (mg/mL)

Acceptance criteria: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Vinpocetine	1.00	—
Vinpocetine related compound A ^a	0.40	0.6
Vinpocetine related compound B ^b	0.75	0.5

^a Ethyl (1*2RS*,13*aSR*,13*bSR*)-13*a*-ethyl-12-hydroxy-2,3,5,6,12,13,13*a*,13*b*-octahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (ethyl vincamine).

^b Methyl (13*aS*,13*bS*)-13*a*-ethyl-9-methoxy-2,3,5,6,13*a*,13*b*-hexahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (apovincamine).

Impurity Table 1 (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Vinpocetine related compound C ^c	0.83	0.3
Vinpocetine related compound D ^d	0.68	0.5
Unspecified individual impurity	—	0.1
Total impurities	—	1.0

^c Ethyl (13*aS*,13*bS*)-13*a*-ethyl-10-methoxy-2,3,5,6,13*a*,13*b*-hexahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (methoxyvinpocetine).

^d Ethyl (12*RS*,13*aRS*,13*bRS*)-13*a*-ethyl-2,3,5,6,12,13,13*a*,13*b*-octahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (dihydrovinpocetine).

SPECIFIC TESTS

- LOSS ON DRYING (731):** Dry a sample in a vacuum at 100° for 3 h: NMT 0.5%.
- OPTICAL ROTATION, Specific rotation (781S):** From +127.0° to +134.0°, determined at 20°.

Sample solution: 10 mg/mL in dimethylformamide

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

Oil-Soluble Vitamins Capsules

DEFINITION

Oil-Soluble Vitamins Capsules contain two or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Vitamin E, Phytonadione (Vitamin K₁), and Beta Carotene. Capsules contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A (C₂₀H₃₀O) as retinol or esters of retinol in the form of retinyl acetate (C₂₂H₃₂O₂) or retinyl palmitate (C₃₆H₆₀O₂); vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O); vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅); phytonadione (C₃₁H₄₆O₂); and beta carotene (C₄₀H₅₆).

Oil-Soluble Vitamins Capsules contain no other vitamins or any minerals. They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• VITAMIN A, Method 1

[NOTE—Where the use of a vitamin A ester (retinyl acetate or retinyl palmitate) is specified in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in *n*-hexane

System suitability stock solution: 15 µg/mL of retinyl palmitate in *n*-hexane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: Transfer the contents of NLT 20 Capsules to a suitable container, mix, and weigh. Transfer a portion of the mixture, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap. [NOTE—For hard gelatin Capsules, remove, as completely as possible, the contents of NLT 20 Capsules by cutting open the Capsule shells, transferring the shells and their contents to a suitable container, and triturating to a homogeneous mass. Transfer a portion of the mass, equivalent

to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap.] Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker in a water bath maintained at 60°. [NOTE—Set up the wrist-action shaker to ensure that the contents of the container are mixed vigorously and thoroughly.] Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Dilute a volume of this solution with *n*-hexane to obtain a solution with a concentration of 15 µg/mL of vitamin A as retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area for all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*. For products containing vitamin A acetate or vitamin A palmitate, calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 2

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution: Cautiously add 9 mL of sulfuric acid to 80 mL of methanol in a 100-mL volumetric flask. Cool, and dilute with methanol to volume.
